OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

☞ If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

This week's cover illustrates the use of farm tractors in the present day large farm operations. The photographs were furnished by Sutter Basin Company, Sacramento. The tractor has made it possible to cover a large acreage, where it is necessary that it be done, in a limited time. You will note from the lower picture, however, that the horse drawn implements still have their place. There will always be some work that can be done better or more cheaply by horses despite the fact that the tractor is the modern motive power for the farm.

* * *

The Cultivator is fortunate in being able to give its readers again this week an article by Mr. Cruess, for Mr. Cruess wastes no words; every column is packed full of information. Last week he explained the process of making maraschino cherries; this week he tells how to can meats, fruits and vegetables. In the fruit products laboratory at Berkeley and in the orchards he has been for years working out processes of economical utilization of California fruits, and the results of his work have consistently been put into the fruit growers hands through university bulletins and circulars, through the farm papers, through the daily press and through personal contact. Mr. Cruess has been a very busy man and a valuable one to the California fruit grower.

* * *

The federal government has investigated the causes of wear on highways, and army engineers report that light weight, swiftly running automobiles cause more damage than heavy trucks at low speed. Bear in mind this does not refer to heavy loaded trucks run at high speed—which often occurs in California, causing serious damage to our highways. The investigation suggests that the people are paying a tremendous cost for allowing all kinds of cars to tear around the country like mad, without regard to the enormous damage they do to highway surfaces.

---

## INDEPENDENCE DAY

Before another issue of the Cultivator comes from the press we will have celebrated another national birthday and started on the 147th year of our existence as an independent nation.

To the small boy and even to some of us older ones the Fourth of July is simply a holiday with the noise of fire crackers, toy pistols and other fireworks, all of which is all right as it serves to impress on our memory the fact that this is a holiday different from all the rest, but we often wonder if the price paid in loss of life, fires, etc., due to careless handling of fire works is not too great considering the enjoyment we get out of it.

The writer still remembers as a boy the joys of looking forward to the coming of the Fourth of July and also some of the pain and sorrow of the day after, and would be the last to take away the small boy's pleasure in fireworks, but if some other way of celebrating this grand day could be invented, that would do away with the death dealing fireworks, we would gladly welcome it. However, so long as we must use firecrackers, toy pistols and all the other paraphernalia to properly celebrate our natal day, let's be careful and try to reduce the accidents as much as possible. The cities have their regulations regarding fireworks, but not so the farms. If the small boy must have fireworks be sure they are set off far enough from buildings or other inflammable material so that there is no danger of fire.

---

## A FIELD

Here's to the meadow lark! Cheering on as I left the orange groves and passed through the alfalfa fields, again amongst the Joshua trees of the Mojave, in Nevada, in the great and as yet unproductive plains of Uteah, and then early this morning in Eastern Colorado, or maybe Kansas, as the engineer wakened and jerked out two sections of vertebrae by backing his long train to secure some slack which he promptly "took up" and got started by a tremendous pull on the throttle, the meadowlark saves the day. I wanted to sleep this morning, but not knowing that, the engineer saw the sun was about to rise, besides it was time to move the watches ahead one hour, so he jerked. I was mad and said—something—and was about to repeat it when, floating through the window in the clear liquid notes of the lark came

We-have-much-to-be-thankful-f-o-r.

Of course everyone else has heard the meadowlark say that a million times, but with me it took a trip from the Pacific to the Atlantic to get into the right frame of mind to hear what the little bird has been saying all his blessed life.

### Ute-ah!

Then there's Utah. Since the days of red school house geography the "Great American Desert" in big letters which covered much of the map west of the Mississippi was supposed to be maintained as a location for the stories of one J. Fennimore Cooper and for the activities of Kit Carson, Buffalo Bill and certain Indian tribes. Also in the western Rockies and in the Wasatch range were other Indians called the Utes. I don't know whether the Utes called their home Utah, but apparently the map makers came along and wrote in that unknown country "Utah," and it stuck. Everyone else has probably known that always—I didn't.

### Colorado

The state of Colorado pours so much of its red mud into the river which bears its name—rather whose name it bears—that "Colored" is easy to remember, even if poor Spanish.

### Kansas

The Indians established their early connection with Kansas by fixing "Great Smoky Water" as its name. Missouri means muddy, so it appears mud enters quite generously into our existence.

It sure does so far as these black Kansas fields are concerned. But there is little of the black to be seen today. Solid gold! As far as the eye reaches on either side, wheat, wheat, wheat! These fields were one of the many "saviors of the world war."

This morning when the meadowlark was singing we were much farther north, and while all grain was headed out, rich dark green prevailed. Later a hint of gold was followed by deep golden waving grain, mile after mile. Only once did I see bound sheaves. Harvesting will begin soon and it's to be one big job. This is Sunday, June 18. Today's Kansas City Star says regarding one county under the head "Need 2,000 Hands:" "The first binder started yesterday in Harvey County's 135,000 acre wheat field on the farm of Henry Rogers northeast of town. Wheat is unusually good this year. An average of 20 bushels to the acre is expected. There are whole neighborhoods that are talking 35. There are fields so thick and rank a jackrabbit cannot get through them, which may yield 50 bushels to the acre. Harvey County will need 2000 harvest hands in the next few days. High wages are being offered, with good beds and fried chicken thrown in for good measure."

At Salina I dropped off and chatted a moment with a dirt farmer. I asked as to wheat all being bearded wheat and he said: "Yes, this is hard wheat—real wheat—Kansas wheat, the kind the world makes bread of." He added: "The general condition of the wheat about Salina is better than was thought, some of the heads being longer than usual and the berry plump and well filled. Some fields on the upland, however, are not so good. The damage from all sources, including the heat, does not exceed ten per cent."

By the time these words are read by Cultivator readers the wheat harvest of Kansas will be in full swing. The only danger now is a hail or windstorm to lodge the heavy straw.

The corn is a foot high along here, Manhattan. If it were not such an old chestnut I might refer to its growing making a sound like unto the hum of an electric fan motor.

### About California

One thing noticeable in traveling is that the principal topic of conversation is—California. If the train stops and all is quiet,—Listen!

"Well, sir, when I was in Los Angeles" or "Those folks in San Francisco, etc.," is sure to be heard up from the other end of the car. For California there is usually expressed either intense hatred or strongest love. The hatred is, however, most evident on the part of those who have never been in California. They have it "from those who live there and would get away if they could" that there is "nothing in California but climate and suckers." I have occasionally tried to break in with some reference to "The two first counties in all America" and besides a total of 13 out of highest 50 in the matter of value of crops produced, and have brought forth "By gosh, I don't believe it!"

### You See, It's This Way

I have a little fund of facts on hand to pull on these California haters—and lovers. We Californians do supply ourselves with information as to California's worth and accomplishments, but really we who live in it, don't—I don't, at least—begin to appreciate its solid, substantial wealth producing, comfort giving worth. Lately I have been gathering some additional data. Inspiration has come to us all from California's mountains bearing the oldest and biggest of living trees, its valleys carpeted with golden poppies, its mountain peak reaching the highest of any in the nation, its valley in the Colorado desert which decends to lowest altitude, or rather to greatest lack of altitude, but there is sometimes opportunity for clinching an argument in referring to more

### Material Things in California

First in gold—though the golden orange brings five times more wealth than does the metal—first in lemons, oranges, prunes, raisins, peaches, olives, pears, dates, almonds, walnuts, cantaloupes, lettuce, celery, asparagus (two-thirds of U. S. supply from California), barley, beans (dry and green), honey (one-seventh of all produced by the nation) and—but stop a moment for a fish story. The state maintains 19 hatcheries located on mountain streams from Bear Lake, San Bernardino County, to Clear Creek in Siskiyou, and these hatcheries are turning literally billions of young fry into stream and ocean so that we will have fish stories for the next generation; meantime we skin the world on quality and quantity of sardines, we are the whole show on canned tuna (the chicken of the sea) the finest lobsters (you fellows back here in the East have the record on crabs), have the biggest bass, the finest trolling, the meanest shark, the biggest whales and, when I stopped for breath, the fellow across the aisle shouted "The —est liars" and as he grabbed his valise and went for the door, I shot at him "California excels in everything!"

If any are poor at guessing and can not supply the letters in the blank before "est" let them try b-i-g.—C. B. M.

# California Cultivator

Vol. LIX No. 1 | Los Angeles, July 1, 1922 | One Dollar Yearly

# Improved Method of Inarching or Bridge-Grafting

By C. S. Pomeroy

IN view of the interest in bridge grafting or inarching of injured or decadent citrus trees which is indicated by the numerous references to such practices in recent issues of the horticultural press it seems worth while to call attention to a method of performing this operation which has proven new to the large number of growers to whom it has been mentioned but which has been in successful use by at least one budder for 12 or 15 years.

The usual practice in inarching is to insert the cut end of the seedling or scion into an inverted T-shaped cut in the bark and with proper attention to the details of the work many operators become very successful. Failure is most often due to the breaking loose of the scion from the tree trunk, the natural swaying of the tree with the wind often being sufficient to prevent healing of the tissues. When the operation is successful the small area of the scion carrying nourishment to the trees makes it necessary to have several of them in order that the tree may function properly.

L. H. Dawson of Corona is the budder who has been using what appears to be an improved method for this operation. For inarching seedlings he digs a hole near the base of the tree and sets in the balled seedling. He then cuts out a section of bark from the tree trunk about an inch and a quarter wide and 12 to 15 inches long., leaving a loose flap of bark at the upper end of the area as shown in the accompanying illustration. The seedling is then laid alongside the tree and its top cut back to a point a little above the top of the area where the bark was removed from the tree. The side of the seedling next the tree is then cut flat, removing about one-fourth the diameter of the twig from the part opposite the cut in the tree. The top of the twig is beveled to a thin edge which is placed under the flap of bark at the upper end of the cut in the tree. The seedling is placed snugly in position against the exposed wood of the tree

**Inarching Eureka Lemon**

Decadent old Eureka lemon tree showing seedling sour orange being inarched by Dawson method. Whip of seedling has been nailed in place against the wood of the tree trunk, the end of the whip extending under a flap of bark. Note pot of hot grafting wax at right.

and nailed with several copper or iron brads, one being driven through the flap of bark covering the cut end of the seedling. This gives two long lines of possible union of the scion and tree, each extending the entire length of the exposed area on the tree, thereby greatly increasing the chances of success of the operation and providing such large areas for the transferring of food elements that only one or two such seedlings need be inarched even on very large trees.

After nailing the seedling in place against the tree it and the remaining area of exposed wood of the tree are painted with hot grafting wax, all parts being thoroughly covered, including the outer side of the flap of bark. A double thickness of waxed cloth is then prepared of the proper width to fit inside the edges of the wound and long enough to cover the wound and extend an inch or so above the flap of bark. This is laid on the hot wax just applied to the wound and is tucked snugly around the seedling and inside the edges of the wound so as to fill it. Another coating of hot grafting wax is then applied to the cloth completely filling all crevices and making a weather proof covering.

The strings holding the sack around the ball of the seedling are then cut and the sack opened from the ball. The dirt is filled in around the ball and it is thoroughly watered at once. The trees inarched in this way should be watered sufficiently often to make sure that the roots of the seedling do not dry out.

It will be seen from the above description that by this operation the inarched seedling is held in close contact with the trunk of the tree for a considerable distance and the wound made in the operation is thoroughly and completely covered and made entirely weather proof. A similar method to this can be employed for bridge grafting by simply making the long cuts on both sides of the area as described above instead of simply inserting the ends of the grafts as is customarily done.

# Sidelights on the L. A. Union Stockyards

By A. L. Spellmeyer

RECENTLY in the Cultivator we asked for information regarding the stockyards plan, and the cards on the table, and the response has been full and frank. Though I have for many years believed a stockyards at Los Angeles would supply a definite market and stimulate production in this Southwest it has been a question of reserved judgment on this particular stockyards plan until we could secure complete information as to the backers and their plans of procedure.

In common with many stockmen and farmers who have suffered heavy loss from what we consider economic injustice and greed of middle marketers, I am inclined to suspicion and close scrutiny of any particular plan that apparently affects production. Therefore, there was much information I wanted about this stockyards, the men in it, and whether it was to be a stockyards for producers and production, or merely a promotion for the real estate, industrial and stock handling profits, with a central market merely created for its milking qualities. I did not use gloves, or leave anything unasked, and with suspicion probed the matter so fully that I am convinced this present stockyards effort is started to benefit and stimulate the livestock industry. I am quite sure this stockyards matter is the one thing of present vital interest to every stockman and farmer of this Southwest.

It may be well to outline the conditions that convinced Dr. Clements and others of the necessity for this stockyards market. The time has arrived when swine production in the vicinity is totally inadequate to supply pork needs or even a considerable percentage of them, and this production in cattle has been at times of the year also spotted. Production has lagged, and the small man in cattle, sheep and swine is notable by his absence, and pig and calf clubs are mostly past memories. Yet meat needs are growing. Hundreds of thousands come to this Southwest yearly. They must be fed, and it does not build up our California, Arizona, Utah and Nevada district to have that meat come from a thousand miles, or from Kansas, in cold storage cars.

The Los Angeles chamber of commerce wanted a market. J. A. McNaughton responded and enlisted the support of some of the heaviest financial men in the country, and the stockyards are here, breaking ground and ready to open for business next winter. They are born from a demand for a market that will stimulate production, through better returns for producers and the encouragement of small production.

The stockyards are organized as a syndicate with subsidiary companies, and the backers include Arthur G. Leonard, John A. Spoor, Halsey E. Poronto, Richard Fitzgerald, John J. Mitchell, E. V. R. Thayer, F. H. Prince, G. F. Gardner and P. D. C. Ball. F. S. L. Harman will be industrial agent and J. A. McNaughton represents the syndicate.

The men listed have various connections in Chicago stockyards and transit companies and in New York, Boston and St. Louis bank and finance circles. They are far more intimately connected with this district of the Southwest than most stockmen realize. I note a name or two I have seen prominent in the federal trade commission reports of meat packers and stockyards. On the whole they are a very heavy and constructive bunch of men, converted to the fundamental that producers must prosper before the city business makes a profit. We can't ask for more, and no group of men know stockyards and livestock finance necessity better than they.

One of these men supplied the money that made possible the activity in cattle here ten years ago in feeding and production develop-

(Continued on Page 14.)

# Agricultural News Notes of the Pacific Coast

## Northern California

California has ten cooperative creameries owned by dairymen.

Potatoes are being dug in several sections of the Sacramento Valley.

Dodgeland, Butte County, is making second cutting of alfalfa. Wheat harvesting has begun.

The first carload of table plums was shipped from Colusa, June 21, through the Fruit Exchange.

E. B. Prine of Fairview, Colusa County, says barley is running from 12 to 18 sacks per acre.

Sale of 18,000 sacks of rice is reported by the California Rice Growers Association at $2.77 for No. 1 Paddy.

More than 25 bids were received by the Prune and Apricot Growers Association on its big plant to be built at Colusa.

Dry north winds in the Sacramento Valley during the early growth of lettuce and carrots have cut down crop quality.

Several fires have been reported in harvest fields with destruction of thousands of sacks of harvested and standing grain.

The Sebastopol Berry Growers Association expects to ship about 150 carloads of berries to Eastern markets this season.

Wm. Gould has resigned his position as horticultural commissioner of Yolo County. H. W. Van Tassell has been named his successor.

The Sebastopol Berry Growers Association has started carload shipments of loganberries to the East. The first carload went to Omaha.

Hetch-Hetchy dam and reservoir, to supply water and power to San Francisco, is expected to be completed by the middle of December.

Work on the new packing house at Colusa of the Prune and Apricot Growers, is being rushed to completion to handle this season's crop.

The Glenn County farm bureau picnic will be held at Butte City, July 4. President Walker of the state farm bureau will be the principal speaker.

Colusa barley growers say: "Some sales have been made in this vicinity. Prices, however, are not sufficiently high to warrant any particular enthusiasm."

Sonoma County supervisors have let contracts for grading and rocking the western section of the Sebastopol-Freestone highway and the one over Brooks Creek.

I. H. Wilson of the California Canning Peach Growers says that practically every ton of peaches in Sutter County has been sold. Sales on the basis of the association's price of $60 per ton.

Berry growers of Sebastopol, Sonoma County, say that the berries this year have had ideal weather to bring them to highest perfection. They have had no trouble in securing plenty of pickers.

Over 200 Napa County farmers made a tour of poultry ranches and hatcheries in Sonoma County on Saturday, June 17. The visitors were guests of the Sebastopol chamber of commerce and Cunningham farm center at a noon lunch at Analy high school.

## Central California

Sweet potato planting is practically finished in Stanislaus County.

Tulare County groves will soon start fumigating for citricola scale.

There are over 2,000 acres planted to melons in the Turlock district.

Citrus thrips have been extremely numerous in Tulare County this season.

The Turlock district expects to ship its first melons by July 15; carload lots by July 25.

Selma, Fresno County, started the fruit shipping season in this district, June 6, on apricots.

At Reedley, Fresno County, fruit packing has begun with the expectation of shipping two cars a day.

The Turlock and Modesto irrigation districts have voted to distribute for themselves power from the Don Pedro dam.

First cutting of the new crop of lettuce in the Salinas Valley of Monterey County will be made within a few days.

Horticultural Commissioner Brann of Tulare County is arranging for cantaloupe inspection in the southern districts of the county.

Frank Daybell, president of the Tri-City Citrus Club of Ducor, Richgrove and Jasmine promises that the club will make exhibit at the state fair.

About 1,000 acres have been planted to cantaloupes in the Earlimart, Tipton, Pixley and Delano sections. This district will be ready for shipments about July 5.

The 920 acre ranch of F. A. Waldeck in the Auckland district 12 miles north of Woodlake, Tulare County, was sold last week to Fred Hedden of Los Angeles.

More than 500 farmers of the Turlock irrigation district made inspection tour and visited drainage demonstrations along canals and ditches of the district, June 22.

Fresno County farm bureau has a square deal department. The purpose of the organization is to assist ranchers in dealing with questions of production and marketing.

Following the resignation of A. E. Beers of Merced, E. E. Welty has been appointed county horticultural commissioner. Mr. Welty has served San Joaquin County as inspector for the past 15 years.

The Valley Fruit Growers Association at a recent meeting at Fresno set a price of 35 cents an hour for fruit picking, five cents per 40 pound box for peach cutting, six and one-half cents per 50 pound box.

Monterey County supervisors have relinquished to the state highway commission control over a portion of the race track road within the city of Salinas. Work will at once be commenced on this strip to put it in condition in time for the Rodeo July 24-29.

At the dairymen's convention held in Modesto, June 12, Manager Baird of the Northern California Milk Producers and J. N. Henderson, president of the Associated Dairymen, were speakers. Joseph Paxton of Athlone and F. H. Davis of Fairmead were delegates.

## Southern California

Many cantaloupe growers fear that heavy shipments will break the market.

Riverside County will have a half a dozen canneries in operation this season.

Onion growers of the Coachella Valley are talking marketing organization plans.

The Deglet Noor Date Association has let contracts for its new packing house.

Yucaipa Valley estimates that at least 5,000 persons visited that section during cherry week.

The Southern California Purebred Livestock Association met at the Maxwell farms in the San Fernando Valley, June 24.

Imperial Valley is making very heavy shipments of cantaloupes, several days' count running close to the 500 carload mark.

Eight carloads of feeder cattle have gone in last week from Hackberry, Arizona, to Cram Bros. ranch in the Chucawalla Valley.

A citrus growers department is to be organized in the Los Angeles County farm bureau at the citrus institute held at Pomona, July 14.

The Elsimore farm center held its annual farm meeting, June 12, electing T. L. Rush director, and R. H. Kirkpatrick secretary-treasurer.

Permanent buildings are to be erected on the fair grounds at Pomona. Two cattle barns and two hog buildings are included in the plan.

Chris Westgard of Brawley shipped to New York a carload of Newcastle apricots for which he received $1.75 per crate at the Brawley station.

W. B. Hooper of Carpinteria has been selected by the state college of agriculture as walnut specialist with headquarters at the experiment station at Riverside.

Bee Inspector Hanson of San Diego County is making a tour of inspection of all the apiaries in the county. He says there will be an unusually large production of water white honey.

The preliminary estimate of the Lima Bean Growers Association: 96,000 acres planted to Limas, 13,000 to Baby Limas. This was in the five counties of Southern California.

Calipatria reported on June 1: "More watermelons have been shipped so far this season than cantaloupes. Cantaloupes are later this season than usual wnile watermelons are earlier."

Apricot growers met at Elsinore June 20. Manager Coykendall and Field Manager Dunlap of the California Prune and Apricot Growers were present and talked over the reorganization plans of the asociation.

The Apple and Pear Growers Committee of Sixteen of Southern California has recommended formation of a grower controlled sales organization to be known as the Deciduous Fruit Distributors of Southern California.

The Southern California Automobile Club is insisting on honest labeling of all oil reservoirs in the thousands of oil stations throughout the southern counties. Los Angeles County has already passed an ordinance and it is hoped others will.

## The Coast and General

Alfalfa harvest is reported lagging in Arizona because of labor shortage.

A good yield of alfalfa seed is indicated in the Yuma section of Arizona.

Skagit County fair will be held at Burlington, Washington, August 15-29.

Nevada reports abundant water for irrigation. Alfalfa and grain crops are growing rapidly.

The Wenatchee District Cooperative Association, Washington, sold last year 2500 cars of fruit.

Yuma section of Arizona reports June drop of citrus normal, leaving promising crop on the trees.

Royal apricots, Mission figs, Santa Rosa plums and some blackberries are on the market from Arizona.

Oregon State Grange met last week at McMinnville. C. E. Spence of Oregon City was elected master.

Hot weather has knocked out the aphis which were something of a problem in fields of Southern Arizona.

Florida shipments of watermelons to June 3 were 4,136 cars compared with 1,473 to same date last year.

Prospects are for a full crop of pears in the Willamette Valley, Oregon; Cherries from one-half to two-thirds.

The annual farmers excursion to Western Washington experiment station will be held the week of July 17.

Cotton growers in Arizona report Pima developing rapidly; in the earlier planted fields the plants are branching.

Farm laborers are being brought into Saskatchewan, Canada, from Holland under guarantee of one year's work at good wages.

Cherry buyers in the Wenatchee district of Washington are paying 7 to 12 cents. Estimated yield of the valley is 140 to 150 cars.

Rain has not fallen on many range sections of Arizona and Western New Mexico for 60 days. Summer rains usually begin early in July.

Moscow, Idaho, will observe the Fourth of July in a two day celebration July 3-4. Wild West roundup, racing and roping, etc., will be featured.

D. W. Working, who has been for some years dean of the college of agriculture of the University of Arizona, has resigned and will go to Colorado.

Two of the largest concrete silos in Arizona have been built on the John Orme ranch in the Salt River Valley. They have a capacity of 500 tons each.

Grass is drying quite noticeably on the northern plateau of Arizona and cattle are thin. Owing to poor range in early spring the calf crop on the plateau is poor.

Cattle ranges of Lower California have not been depleted by revolutionary raiders as have those in other sections of Mexico. The cattle are said to be in good condition.

Prof. E. H. Wiegand, in charge of the fruit by-products laboratory of the Oregon Agricultural College, is now conducting experiments in producing a Maraschino cherry equal to the French product. Large quantities of Oregon Royal Ann cherries are every year pickled and barreled and sent East to be made into Maraschino cherries by methods carefully kept secret.

# Safe Methods of Home Canning

By W. V. Cruess, Fruit Products Laboratory, University of California

BECAUSE of the wide publicity given to botulism from home canned foods many of the home canners have become frightened and have either given up home canning or have greatly reduced the amount of their canned and glassed fruits and vegetables. If tried and tested methods of home canning are followed there is no danger from the much over-advertised bugbear of botulism. The present article is an attempt to cover in brief several safe methods of home canning.

### Sterilizers

For the canning of fruits and tomatoes no special sterilizer is necessary. All that is needed is a wash boiler or any other large covered vessel fitted with a false bottom on which the jars or cans can be placed during sterilization. In using the wash boiler the writer prefers to fill the boiler with water to about one-third the height of the jars or cans. The practice of covering the jars completely with water involves the use of a large amount of fuel for heating and often results in contamination of the contents of the jars with the water from the boiler.

For the home canning of vegetables the writer strongly recommends the use of a steam pressure sterilizer and tin cans. Fruit jars when placed in a pressure sterilizer lose from one-fourth to one-half of the brine or syrup during the cooling process. The use of jars in a pressure cooker is usually disappointing to the home canner.

Pressure cookers made of aluminum may be used for many purposes in addition to home canning. Meats and vegetables may be cooked for the table in a pressure cooker with the expenditure of very much less gas or other fuel than is necessary in cooking in an open kettle. Roasts may be given a preliminary cooking in the pressure cooker to make them tender, before browning them in the oven. These pressure cookers can be obtained from any hardware dealer at the present time for a very reasonable figure and because of their many uses should be a part of every kitchen equipment.

The time, temperature and pressure necessary for sterilizing various products in a steam pressure sterilizer are given in the time table.

In using the pressure cooker for vegetables the product is canned scalding or boiling hot and sealed at once. The sealed cans are then placed in the pressure cooker with about three inches of water. The pressure cooker is then sealed and the release cock is left open. The sterilizer is placed over the flame and heated until steam escapes freely from the release cock. This release valve is then closed and the pressure is allowed to rise to the desired point. Then this pressure is maintained by regulating the flame or opening the valve slightly. The temperature and time used are those indicated in the time table; thus, for string beans for ten pounds pressure the time of sterilization should be 40 minutes. Corn would require 90 minutes at ten to fifteen pounds pressure.

### Cans and Can Sealers

For the home canning of vegetables the writer would use, if possible, quart or pint sanitary cans sealed by a special can sealer, obtainable from dealers in California whose names will be sent on request. These can sealers at the present time cost from $18.00 to $30.00 approximately and are very satisfactory for home canning purposes. Cans cost approximately 3½ cents apiece. With care they can be used twice, but under ordinary circumstances one season's use is all that can be expected of them. The can sealers do not use solder nor solder flux. The lid is sealed to the can by a special rolling or seaming device operated by hand. The can sealer clamps to the kitchen table and is very simple in operation.

### Jars

Every home canner has his or her preference in regard to jars. The writer prefers jars with glass tops held in place with a wire bail. Jars with metal caps frequently become corroded. This is particularly true of jars which carry lids sealed with rubber composition. The glass top jar is very convenient to use and leaks may be easily detected. With care it will last a lifetime. For these reasons, in our experimental work at the university we have found the glass top jars most satisfactory for our purpose.

### Brines and Syrups

In the cold pack process of canning, which is the most convenient method, brines and syrups are added to the prepared fruit and vegtables in the jar or can. If vegetables are to be canned in boiling water by use of the wash boiler sterilizer it is recommended that brines containing from five to six ounces of lemon juice per gallon of brine be used as it reduces the time and the temperature necessary for sterilization. The slight acid flavor resulting from the lemon juice can be neutralized by the addition of a small amount of baking soda when the jar or can is opened for cooking or for use on the table. Just a pinch of the baking soda is all that is necessary. The lemon juice can be conveniently added to the brine by the use of a measuring cup. About two-thirds of an eight ounce measuring cup is added to every gallon of brine. Do not attempt to add the lemon juice direct to the jar or can, always add it to the brine and mix it thoroughly before adding the brine to the vegetables. The brine should be boiling hot when added. A large teakettle will be found convenient for heating brines and syrups. The brine in addition to the lemon juice should contain about two level tablespoons of salt per gallon.

If the pressure cooker is used omit the lemon juice and add only the salt to the brine.

Syrup for fruits will vary in sugar concentration according to the tartness of the fruits. Sour fruits will require a heavy syrup consisting of about one cup sugar to one cup water, which is brought to boiling and added boiling hot to the fruit. Sweet fruits may be canned in syrup containing one cup sugar to two or three cups water.

### Berries

Berries are disappointing if canned in syrup in the manner described for other fruits. The writer prefers to heat the beries with an equal weight of sugar, without the addition of any water, to the boiling point for two or three minutes. They are then allowed to stand over night in the syrup formed by the cooking process. They are then put up in glass jars and the glass jars immersed in water in the wash boiler sterilizer with the jars sealed. The water is then heated to 180 degrees Fahrenheit for about 35 minutes or to the simmering point for about 30 minutes. This will yield a very attractive product.

### Time Tables

At the end of this article will be found three tables which give the times and temperatures for sterilization of various products.

### Effect of Altitude

The table is designed for altitudes from sea level to 1,000 feet altitude. For altitudes above 1,000 feet increase

(Continued on Page 11.)

# This Month in the Vegetable Garden

## Northern California

By A. R. Gould

THE sensational rainfall recorded in Northern California last month although slight was of some value to the garden and made us wish that it might become regular as it would mean less irrigation artificially which means so much extra labor.

The need for intensive cultivation is still as great as ever and considerable thought must be given to close cropping of all the plots. To do this it will be necessary to keep them well manured as they are cleaned off, and the best quality vegetables will only be secured in this way. It is better to spend a little more on fertilizers than to spend time and money on poor land and get nothing at the finish, hence it will aways pay to have a load or two of farmyard manure on hand and a few sacks of artificial fertilizer. Any plots of poor soil which were planted to carrots, beets, lettuce, turnips, etc., and the plants show signs of being unhealthy should have a little artificial fertilizer worked in between the rows. It can be raked in and afterwards the sprinkler can be applied. There will still be successional sowings of some vegetables and the wise gardener will look ahead and be preparing for the winter supply.

### Carrots

Make another sowing on rich soil of French Forcing and Danvers Half long which is excellent for the table and is also a good keeper for the winter. Sow about 16 inches apart in rows very thinly.

### Lettuce

Sow very thinly broadcast and transplant or in rows and thin out, California Cream Butter and Los Angeles, on a well prepared plot. Established plants now making heads should have plenty of water at regular intervals and be kept well cultivated between the rows.

### Squash, Melons and Cucumbers

These should now be making large plants. See that only one or two are left to each mound and carefully cultivate after each watering. If the squash bug becomes troublesome dust the foliage with lead arsenate every week at least.

### Corn

Still time to make another sowing of Country Gentleman, Golden Bantam or Golden Cream. As the cobs develop they should each one be dusted with lead arsenate as this will destroy the larva of the moth which lays its eggs in the silk of the cob.

### Peppers

Secure strong healthy plants of the Bell and Chili pepper and plant out 8 to 10 inches apart in fairly rich soil.

### Turnips

Make a sowing of Early Snowball and Purple Top White Globe for late fall use. Keep the bed moist.

### Kale and Brussels Sprouts

Sow the tall green kale and Aigburth sprouts on a well prepared border which should be partially shaded. Prepare the plots during the month by trenching deeply with manure. As soon as the plants are strong enough they may be transplanted.

### Beans

Sow Golden Wax and Stringless Green pod for a successional late crop and keep the cultivator busy between the rows of the earlier sown varieties.

### Peas

Collect all the dried pods from the vines and store for winter use. Clean up all the plots and prepare for some winter crop.

### Tomatoes

Cultivate these frequently and spray with Black Leaf 40 at the first sign of aphis.

### Berries

Irrigate twice during the month and mulch between the plants with well rotted manure.

## Southern California

By D. F. Reichard

WHILE July is one of our principal harvest months it is also time to get ready for planting as the next three months, July, August and September, may be called a second spring in Southern California. In many ways this period is as important as the real spring of the year as it is during these months that our winter gardens are started.

As the spring and summer crops mature and are harvested thoroughly wet the ground by flood irrigation, or in small patches a sprinkler may be utilized, and as soon as the ground is dry enough to work, pulverize it to the depth of ten or twelve inches, being sure to have the surface in a good fine condition so that the evaporation will be as slight as possible. If you are not ready to plant immediately after getting the soil in shape it is just as well to let it lie in this condition for two or three weeks and then a few days before you expect to plant irrigate again, or if you use the "ridge" system you may furrow out the land to be planted and sow the seed on the sides of the ridges, if the land has held the moisture well, but

(Continued on Page 8.)

# Stop sidesway, upthrow and vibration with Hasslers

THE lively, quick-acting Hassler springs cushion the downward movement of your car's body, and then instantly the same springs check the upthrow.

Hasslers lessen the vibration that ceaselessly pounds your car to pieces, and the angular position of the coil springs stops sidesway.

When you use Hasslers your car stays tight longer. You minimize rattles! Breakage and wear are greatly reduced. Upkeep costs are cut.

Hasslers permit you to drive faster on rough roads, save hundreds of dollars' worth of time, prevent accidents and avoid delays.

Only Hassler Shock Absorbers have the famous Hassler action; they alone can give you that full protection and comfort. Test them ten days at our risk on your Ford or Dodge Brothers car. Ask your dealer.

# Frosted Citrus Trees

NOT all citrus trees that appear in excellent condition at present are in the full vigor of health nor are they functioning sufficiently to insure a good tree for the future. The young tree shown in the accompanying illustration was well leaved and of good color, yet a close examination of the trunk showed that it was almost completely girdled by the freeze of January, but a half-inch strip of the cambium or inner bark remaining alive.

So it was sawn off as shown, for a half-inch of live cambium is not sufficient to feed a tree of this size. As the trunk was severely injured in all parts, bridge grafting with young seedlings was inadvisable if not impossible. So Farm Advisor Hodgson of Los Angeles County, who was demonstrating, said: "Cut off the top. Leave the old trunk for the present, in lieu of a stake, to tie the young shoot to. You will notice that three or four small shoots have started above the bud union. Leave the strongest of these and build a new tree, tying it to the old trunk for support and pulling off the remaining shoots. Next spring a clean cut of the old trunk should be made, close to the young tree, on a slope, with the new tree on the upper side and the stump well waxed over.

**A Deceitful Appearance**

Young orange tree in full leaf, with large top. Investigation proved it had but a half inch strip of live bark, hence its beheading.

### Does It Pay?

"The main question to be settled in the case of frosted trees is: What is best for the tree owner? It is not enough that the tree be saved if it will not build up into a good crop producer for future years. A careful survey of trees injured in the 1913 freeze shows that young orange trees are easier to rebuild than young lemon trees. In coastal districts young lemons up to three years old should be pulled out. Trees older than three years may be rebuilt but the question should be asked, and seriously considered: is it profitable? Many of the rebuilt trees of 1913 have not yet recovered from the freeze of that winter. It would have been better to have pulled them out and replanted. In interior districts it is easier to rebuild young lemon trees.

"Young orange trees may be still easier rebuilt, but again, is it profitable? It requires lots of work and close attention, being equivalent to growing a nursery tree, which the average orchardist does not do well for he does not apply the time and energy needed, the call of the orchard being strong, its needs less and far less exacting in frequency of visits. If the injury is considerable it is probably better to pull out and replant with young trees, being sure that these young trees have not likewise been injured by frost.

"In rebuilding, the method to be followed is the same as that shown in the young tree just cut down. Cut off below injury and drive a stake or leave old trunk for support of new tree. Choose a sprout from just above the bud union and below all severe frost cracks. At this time (June 13) you can tell fairly well the extent of frost injury, so you may cut off old trunk if you wish. Good results come from such procedure, as they do from leaving old trunk in lieu of a stake, to tie to. If injury is less severe, none below 12 to 18 inches above the ground, then choose several sprouts from this height for framework of a new tree and cut away the old and injured top.

### Rejuvenating Old Trees

"A tree can be killed more quickly by severe pruning than by direct starving through lack of food. If leaves are pruned away no plant food can be manufactured, therefore do not prune off these 'factory hands' engaged in manufacturing food for the tree. Slightly injured trees should be pruned little or none at the present time. But if injury is sufficient so part or all of top must be rebuilt, prune now. But unless trees are to be protected from possible frost injury during the coming winter by smudge pots or otherwise, better leave pruning until next spring. In the event of pruning, in young trees or old, be sure to whitewash exposed trunks and main branches on south and west sides at least to protect from midday and afternoon sun."

## PREPARE AT ONCE TO COMBAT RED SPIDER ATTACKS

**By E. R. de Ong**

Preparation should be made at once for combating the summer attacks of red spiders, especially on prune, plum, peach and almond trees. Other varieties which are occasionally injured are pear, walnut, apricot and cherry.

The common red spider, or two-spotted mite, is perhaps the most injurious pest of deciduous orchards in the interior valleys. The actual crop loss through decrease in production and reduction in the grades of fruit amounted to approximately $139 per acre in one orchard and $453 in another. Besides the crop loss for the year the buds for the following season's crop are seriously injured. Damage of this kind was found to be almost equal to a lack of irrigation. A form of injury frequently seen is defoliation in mid-summer. This prevents a tree from maturing a crop, growing new wood or producing buds for the next year. Prematurely defoliated trees, when well irrigated, frequently throw out a second crop of leaves and even bloom at the expense of food stored for next season's growth, hence such trees are weakened and have a light bloom. The principal points in prevention and control are:

Abundant moisture: The trees should be kept in vigorous condition by adequate supply of moisture in order that they may be as well prepared as possible to withstand the attacks of the pests. Control methods are useless if the trees are weak from drouth.

Spraying: Spraying as a control for the common red spider should be done at the time the attack usually began in previous years, even though the mites cannot be seen. Spray very carefully, using five pounds of sulphur (made into a paste with calcium caseinate or glue water) to one hundred gallons of water. Should the spraying be delayed until the red spider is abundant, add one gallon of lime-sulphur concentrate (or its substitutes) to 100 gallons of the foregoing spray mixture and apply two or three times at three weeks' intervals. These directions are recommended also for severe attacks of the almond mite or citrus mite.

The control of any species of red spider by spraying requires timely and extremely careful applications. Careless, scanty spraying is almost worthless. Cover both sides of the leaves and every part of the tree, using from five to ten gallons per tree. An early application, usually about the first of July, is of far more value than late sprayings.

Sulphur dusting: As a control for red spider sulphur dusting is of the

greatest value in regions of light wind and moderate humidity. Use a ten per cent filler of hydrated lime in all dusting sulphurs and apply every 10 to 15 days. Three applications are usually necessary unless all conditions are very favorable.

The cost of the materials for the sulphur and calcium caseinate spray will be about $2.30 per acre for trees of five years of age or more. Including the cost of the lime-sulphur solution or the dry substitutes, the expense per acre for materials will be from $3.50 to $6.00 per acre. The range of cost of sulphur for dusting will be about $1.00 to $3.50 per acre for the materials alone. One spraying sufficiently early and thorough will frequently hold the mite in check for the season but three dustings are usually necessary to accomplish the same result.

The injury caused by red spider, together with control measures, is given in a bulletin being published by the University of California agricultural experiment station, copies of which may be secured by writing to the director of the station at Berkeley.

## WAGE SCALE IN FRUIT WORK

Schedule of wages for picking, cutting, etc., has been set by the Valley Fruit Growers Association at Fresno. Prices set by the fresh fruit packers were endorsed, and in addition the Valley Fruit Growers have set a price of 35 cents an hour for fruit picking and five cents per 40 pound box for peach cutting, or 6½ cents per 50 pound box. This is a slight decline from the prices of last year. The fig and prune schedules will be announced shortly.

### Grape Picking

Seedless.—Trays to unit: 2½ cents, 500 and over. 3 cents, 400 to 500. 3½ cents, 300 to 400. 4 cents, 200 to 300. 4½ cents, 100 to 200.

Muscats.—Trays to unit: 3 cents, 500 and over. 3½ cents, 400 to 500. 4 cents, 300 to 400. 4½ cents, 200 to 300. 5 cents, 100 to 200.

### Packing House Wages

Peach, per 100, 75 cents; 8 pc. crate, per 100, $1.00; 6 pc. crate, per 100, 90 cents; 4 pc. crate, per 100, 80 cents. L. A. lugs—Cleated 4 nails, per 100, $1.00; cleated 6 nails, per 100, $1.10.

Malaga special—Picking box, per 100, $2.50; with corner post, per 100, $3.25.

Lidding crates—Grapes, per 100, 60 cents; with conveyor, per 100, 50 cents. Peach, per 100, 50 cents; with conveyor, per 100, 40 cents.

Lidding lugs, per 100, 40 cents.

Loading, per hour, 55 cents.

Load and trucking lugs open, per 100, 45 cents.

Loading and trucking lugs, lidded, per 100, 40 cents.

Loading lugs—Open, per 100, 30 cents; lidded, per 100, 25 cents.

Tallying, trucking and loading grapes, per 100, 50 cents.

Floor help, per hour, 35, 40 cents.

Packing grapes, per crate, 3½ cents.

Packing peaches, per crate, 3 cents.

Packing plums, per crate, 5 cents; small, per crate, 7 cents.

Labeling, per 100, 20 cents.

## WALNUT FIELD DAY

The second annual Walnut Growers field day is to be held at Santa Barbara, Saturday, September 2. The morning program will be held at Tucker's grove at Goleta, 7 miles north of Santa Barbara and will consist of an address of welcome by E. W. Stow of Goleta, a discussion of the growth of walnut growers departments of the various Southern California farm bureaus by Farm Advisor Hodgson of Los Angeles, a report on the 1922 season's outlook, by W. T. Webber, sales manager of the California Walnut Growers Association, and a discussion of new developments in the cooperative movement which it is hoped may be given by President C. C. Teague of the Walnut Growers Association. A big barbecue will be served at noon. The afternoon program will consist of a field trip to points of special interest with field demonstrations to be conducted by Professors R. E. Smith and J. W. Nelson of the University of California, and by H. C. Sharp of the field department of the California Walnut Growers Association.

## LIME FOR ACID SOILS

Heavy clay soils will need fully twice as much lime as sandy soils, and especially is this the case with heavy soils containing sour humus. But no matter what the soil, thoroughly mix in the lime as soon as applied, either by harrowing or cultivating. Do not allow it to lie exposed on the surface. Other materials than lime have been used to correct soil acidity, but none of them act so quickly, are so cheap, or so lasting in their effects. Some of them also produce other and undesired results.

## STATE DEPARTMENT MOVES

After many months of life in congested quarters, the California department of agriculture on July 1 moved its new home to 10th and L streets, Sacramento. This building will accommodate the entire department and all outlying branches of the service will be centralized in Sacramento.

## LIME FOR MELONS

It is not well to attempt growing cantaloupes or muskmelons in the same plat with watermelons. While both will grow in ordinary soil the watermelon is not harmed by a little acidity, but cantaloupes will not thrive upon acid soil. Repeated experiments have shown that cantaloupe soils produced best when well limed. Pumpkins and squashes, near relatives of the melons, also thrive best where soils carry a heavy lime content.

# How to Increase Fruit Crops With Less Work

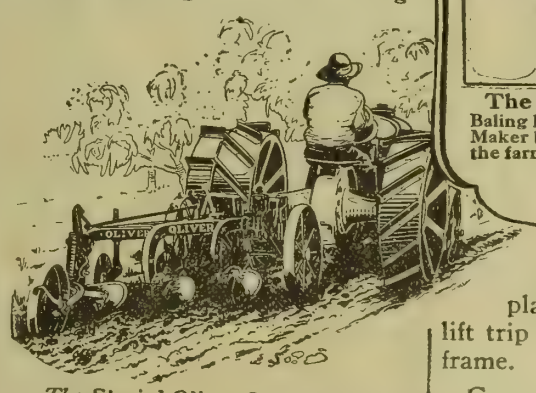
*The new era of farming-profit, the era of Fordson Farming, offers every farmer bigger crops, larger profits, and time for pleasure doubled.*

FARMERS and fruit growers now recognize the opportunity to speed up work by using the fast-running Fordson in combination with the special orchard tools made to go with it. For the more thorough tillage insures better crops, while the faster work of the Fordson enables one man to care for more acres. Thus, both reduced expense and increased returns come with the adoption of Fordson Farming.

With his work now done in less time, the Fordson farmer's entire family is benefitted. There is more inclination toward pleasure; more time for those enjoyments to which everyone is entitled.

Naturally, the development of an orchard plow to work behind the Fordson tractor had much to do with making these important advantages available to fruit growers. The result of such development is the special Oliver Orchard Plow. Not only will it run close to trees and vines, but it is so made that it does not injure even the low hanging branches. With its three bottoms, a lot of ground can be covered in one day. And with the special design, thorough work is assured. The hitch allows for the plow to run to the left or to the right of the tractor, or directly behind it. Thus the soil may be thrown toward or away from the rows.

Possibility of tearing branches or barking tree trunks is removed by eliminating levers and setting



*The Special Oliver Orchard Plow*

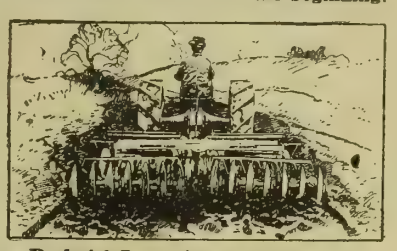
the wheels within the cut of the bottoms. Crank screws take the place of levers and the power lift trip is below the level of the frame.

Cover crops are easily turned under. The placing of the front furrow wheel gives plenty of clearance for heavy vegetation, and the shape of the bottom insures thorough pulverization of the furrow slice.

Sixty-five years of plow-building experience is your assurance of constant satisfaction with the special Oliver Orchard Plow.

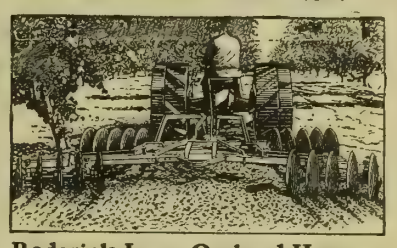
**The World Famous Oliver No. 7**
On thousands of farms, the world famous Oliver No. 7 has been the plowing partner of the Fordson from the beginning.

**Oliver Single Bottom Sulky**
For deep mouldboard plowing in trashy conditions with the Fordson. Similar in construction to world famous No. 7 gang.



**Roderick Lean Automatic Harrow**
Fitting the seed bed the Fordson way with the Roderick Lean Automatic Tractor Disc—a special Fordson Harrow.

**Good Work With Roller Pulverizer**
Final Fitting of the seed bed with Fordson power and the roller pulverizer has meant more bushels for many farmers.



**Roderick Lean Orchard Harrow**
Orchard discing with Fordson speed with gangs set in or extended with the Roderick Lean Automatic Orchard Disc.

**The Amsco Tractor Drill**
Tractor speed and accuracy utilized by the Fordson owner with the Amsco special drill. Force feed makes positive planting.

**The Amsco Two-Row Cultivator**
Cultivating corn is easy for the Fordson farmer with the Amsco Cultivator—special for the Fordson. Made for hard work.

**Money-Maker Ensilage Cutter**
Fordson silo filling with the Money-Maker done quickly and cheaply. Strength and scientific design give perfect work.

**The Money-Maker Hay Press**
Baling hay with the Fordson and Money Maker baler is an important operation to the farmer with large hay acreage.

**Wood Bros. Individual Thresher**
The Wood Individual Humming Bird Thresher and Fordson make short work of threshing. All grain is saved.

## Ford Dealers Everywhere Sell Standard Fordson Equipment

### VEGETABLE GARDEN FOR JULY IN SOUTHERN CALIFORNIA

(Continued from Page 5.)

if it seems to be a little dry you should let the water run down the furrows before sowing the seed and then sow your seed as soon as you can get on the ground after this irrigation. It is imperative that ground have ample moisture when putting in the fall garden, as the long hot days will surely kill your young plants as they start from the seed unless there is enough moisture there to keep them damp.

All through the month of July the planting of sweet corn and string beans should be carried on as there is ample time for them to mature before cold weather comes.

Summer squash, cucumbers, muskmelons may be planted any time during this month; while winter squash, watermelons and field corn may be put in the early part of the month with equal safety. During July late tomatoes are planted for October and November picking. Of the hardier vegetables these should be planted the latter part of the month. Beets, carrots, radishes, lettuce and Long Standing spinach, all to be planted where you wish them to grow to maturity. Sow the seed of cabbage, cauliflower, Brussels sprouts, Swiss chard and kale in seed beds or rows, later to be transplanted to the places you wish them. The planting of the fall and winter crop of Irish potatoes is also started during the latter part of July. Of the crops that were put in a month or so ago these must be watched closely to see that they do not want for water, as the evaporation in these warm days is tremendous and your plants will suffer and your crop be materially reduced unless the water is in good supply. Also watch your plants for aphis and thrips and for other insects as well as mildew and rust. For the aphis and thrips spray with Black Leaf 40; for chewing insects use arsenate of lead and for the mildew and rust use Bordeaux or powdered sulphur. These may be applied either in the dry state with a powder gun or dust machine, or they may be applied in the liquid form with spraying machine.

# Reduced Rates on Shipments

## —to and from Eastern and Pacific Coast Points

ARE you moving "back East" or, have you friends or relatives who are moving out West? In either case, a substantial saving of freight charges on furniture, household goods and automobiles may be made by shipping "the Bekins way." It is possible for us to quote reduced rates because we consolidate carload shipments. Our method also provides for "thru car service"—quick transportation.

**Consult Us Before Moving**

## Southern Arizona

By M. E. Bemis

CORN and beans for July. There are few things more important for the home garden and for the truck garden. I have written about our Arizona corn so many times that it seems as though anything that I can say must be a repetition. Perhaps, though, it is new to some, and possibly others forget and need to be reminded.

Mexican June corn has been improved until it now has reached a stage of development where it is a most desirable silage crop for the farmer and as a summer grain crop for horses, cows, pigs or poultry there is nothing in its class. For roasting ears, if there is any variety of sweet corn that is any better, the memory of it has left me. Certainly we don't raise it in Arizona. Yet Mexican June corn is not yet perfect, and there are opportunities for some who are of a more or less experimental turn to continue its development until a superior strain has been produced, similar to the choice varieties of corn that have been brought out in the Middle West. The type is not yet as uniform as it should be and the ears are grown too high on the stalk. These are the chief defects.

Pima sweet corn is a variety of corn that grows very quickly—some claim to be able to produce roasting ears in about ten weks. The stalks are short, the ears small, but the quality is splendid. This variety may be planted up until the first of September. Mexican June should be planted for a main crop from the 10th to the latter part of July. For roasting ears it can, of course, be planted later.

Beans can be planted the latter part of the month. Some recommend only the Kentucky Wonder Wax this month. Of this bean John Schalolis, gardener at the state hospital, says: "It is very early and enormously productive, the long green pods hanging in clusters on the poles. They are entirely stringless and very tender. It has long been known as a favorite as it meets with a ready sale on the early market and is considered a delicacy in the home garden."

July is the time to start the cabbage and cauliflower plants to be set out later when the weather is cool. The varieties of cabbage which are recommended are Early Winningsstdadt and selected Early Jersey Wakefield, both oblong or pointed varieties. Of the round head kinds the Danish Ball Head or, as it is sometimes called, the Holland, and the early and late varieties of Flat Dutch are good. Henderson's Early Snowball cauliflower is recommended. Careful growers are finding that it is possible to produce splendid cauliflower, and as the demand is good there is no special reason why not only the home supply, but a surplus for shipping to near-by markets should not be produced here. Seed may be sown in the latter part of July in propagating beds, but the beds must be shaded with burlap or lath. Many prefer to wait until the latter part of August, as seeds of many plants including cabbage and cauliflower are hard to make germinate during the hot weather. The advantage of having plants to set out early may make it worth while to try the early seeding on a small scale.

Casabas, the late fall melons, as well as late squash and pumpkin may be planted in July.

Places in the garden that are to be vacant until after frost may be filled with any of the varieties of grain sorghum. Corn is probably better though for the garden as it produces nearly as much grain, is not so hard on the soil and can be used for roasting ears if desired. However grain sorghum is easily grown and makes good chicken feed. Sudan grass, frequently mentioned, grows quickly, does not cost much for feed, keeps the ground in good mechanical condition, and is a splendid summer green feed for chickens.

Cow peas are not relished by many people as compared with most garden vegetables but still make a change when variety is lacking. They are easily grown and will help wonderfully in getting the soil into that near perfect condition that the good gardener likes to have. If grown merely as a cover crop they can be spaded under or plowed under whenever the ground is needed for something else.

Most crops rquire lots of water during the summer months, but less water is needed if a cultivation follows each irrigation as soon as the soil has dried out sufficiently to make it possible to work it. Weeds grow just as fast and sometimes it seems faster than the crop that we want to have grow, hence the cultivation serves two purposes, conserving water and killing weeds. There are many plants that should not be irrigated by flooding as it is better that the water does not touch the stems or stalks. For this reason most garden plants are grown by being started on the side of a furrow just above the water line. Successive cultivations are made to throw the earth towards the plant so that it stands on a ridge, the water running in furrows on either side.

# This Month in the Ornamental Garden

## Southern California

By Ernest Braunton

JULY is usually "some" warm, and for that reason no general planting should be done. Plant little and of that only what must go, for it will need extra care if results are to be good. Best pay more attention to things already growing for this is trying weather on folks and flowers. There is no other factor that helps stability of soil conditions more at present than mulches.

### Mulch Valuable

An examination of a well tilled soil recently showed the necessity for water to aid small shrubs planted last spring. A two inch mulch of fine stable manure had been placed a foot away from the base on all sides of each shrub. When this was cleared away the soil beneath was very damp and a close examination showed that the shrubs needed no water. A deep soil mulch covered the remainder of the bed but the soil needed water. The irrigations are given by flooding the entire bed, so the value of mulching is well proven.

### Use Stakes Liberally

This is also a time for staking, for the more water applied the softer the soil, the heavier the tops of plants and therefore the great need at this stage of artificial support. While providing stakes for all that need them try to have them as inconspicuous as possible, in size, color and position. Nearly all garden plants front on a path and stakes may be placed on the back or rear side of plants. Thus will you avoid that appearance of a horticultural cemetery, even though all the garden inmates are alive.

### Distribute Plant Food

Now that vegetation has made its greatest or spring output of vigor it will need reenforcement to carry on. Liquid manure is used by the best gardeners and as fast as the raw material is leached out the residue is used for mulching about the plants.

Others use chemical fertilizers, but in either case it is best to supply all food in liquid form. In no other form can the plant absorb or use it and the danger of too great concentration in spots is avoided. In liquid form the distribution certainly is most uniform.

Some will say: "Can't we sow any seeds now?" Nasturtiums and portulacas are the easiest of all to grow in hot weather. But in the writer's garden four shades of red California poppies (Eschscholtzia) are just peeping through the soil in great numbers, as are three kinds of celosia, one the common cockscomb. More care, especially in frequent and heavy water supply, is needed than at other seasons of the year. So we must again turn to care of plants growing.

**Watch Growing Plants**

Vines will be making a heavy growth and must be kept somewhat orderly by tying or "tucking in" the rampant streamers. Mildew attacks many plants in many parts during hot weather and in these cases use sulphur freely, for in hottest weather it is most effective.

## Northern California

By A. R. Gould

THE most important task this month will be to keep the garden watered as any neglect in this work will soon result in a dilapidated condition and mean poor lawns and less flowers, and restoration will be more expensive and difficult.

There are of course some cases where a real shortage of water necessitates a change or reduction in the irrigation system, but where there is an ample supply it pays to keep the flower garden watered systematically and thoroughly. Often a newly established lawn is ruined by improper watering. It is absolutely necessary to water lawns evenly and to use a fine mist spray to allow this to soak in, and during the hot, dry summer the lawn will require extra care. Many shrubs will need careful irrigation, and this should be done by making a basin around the roots, covering in afterwards. Such subjects as bamboos require considerable water. All tall growing subjects must be tied up to strong stakes but large unsightly stakes should not be used to ruin the beauty of the plants.

**Dahlias**

Some of these will soon be showing flower buds and they must be kept disbudded, leaving one terminal bud and removing the two smaller on each shoot. Mulching around the roots with manure is a good plan to help hold the moisture while it will act as a liquid stimulant.

**Roses**

The dead blooms must be kept cut off and any roses showing signs of fungus disease such as red rust must have their affected leaves removed and sprayed with Bordeaux mixture, which will hold the disease in check if the bushes are sprayed several times.

**Begonias**

It is surprising what a large number of species there are of these and they are all useful for growing in a semi-shaded place. While the fibrous

*Look for*

**LOWEST COST**

*in the next tire you buy*

You do not want the kind of low cost that eventually becomes high cost. You do not want the cheap tire that proves in the long run to be an expensive as well as annoying experiment.

The real low cost tire is one that sells at a reasonable price and then rolls off mile after mile of uninterrupted service—the tire that renders easy, comfortable riding, low operating costs and greatest mileage.

The Savage Cord is built from the inside out to give long wear and faithful service, to resist hard usage and rough roads, and to save you money—even in gas, oil and repairs to your car. We realize this is a broad statement and we do not ask you to believe it without proof. Compare the construction of our tire with others, *see the seventeen constructional features we have put into it*—then you will appreciate our claims are true.

You can buy tires that cost less to begin with, but Savage Cords pay you better by costing less in the end.

Other good makes of tires may use one or more of the seventeen constructional features we have incorporated into the Savage Cord but no other tire that we know of begins to embody them all.

**WE GUARANTEE**

that not an ounce of shoddy or adulterants is used in the building of the

### DO IT NOW

He was going to be all that a mortal should be—Tomorrow.
No one should be kinder or braver than he—Tomorrow.
A friend who was troubled and weary he knew,
Who'd be glad of a lift and who needed it, too;
On him he called to see what he could do—Tomorrow.
Each morning he stacked up the letters he'd write—Tomorrow.
And thought of the folks he would fill with delight—Tomorrow.

It was too bad, indeed, he was busy today,
And he hadn't a minute to stop on his way;
More time he would have to give others, he'd say—Tomorrow.
The greatest of workers this man would have been—Tomorrow.
The world would have known him, had he ever seen—Tomorrow.
But the fact is he died and he faded from view,
And all he left when living was through
Was a mountain of things he intended to do—Tomorrow. —Grit.

### THE SCOOP THAT FAILED

(Concluded.)

The two men rose, stepped into another room, greeting the police lieutenant in charge there, then stepped outside.

"Oh, there's one little matter," broke in Parker, as the two walked briskly along. "Another News man covered the raid on Tim Marks' nest out in Inwood tonight. I didn't have to touch it, but of course I know it should be turned in at combination time just the same. I suppose the Journal has the yarn, though. If not I can give you the main points."

"We have it," replied Preston with a start. "Thank you just the same."

"I spoke about it just for the sake of dealing squarely, you know," Parker went on. "And say, I mustn't forget to tell you about the Pentnor matter—Will Pentnor, you know, the missing treasurer of the Upshaw Mills. He vanished and was supposed to be two hundred thousand dollars short in his accounts. The police out in the Mission district were looking for him. He returned about two hours ago in care of two physicians and a nurse. It seems he had wandered off in a condition of mind that made everything a blank to him. He turned up in Brenton and it was days before the physicians who were called in to treat a sick man at a hotel there managed to find out his name and that he belonged in this town. And the missing securities were found about an hour ago in a special compartment in the Upshaw safe to which he had the only key. That small compartment had been overlooked. It makes a big and interesting story, for Pentnor now has come back into his own mind. I didn't handle the story, but I know all about it. The police haven't yet been officially notified, and probably won't be until morning. Glad I didn't forget this tip, or you'd have blamed me for holding out."

Back in the city editor's room once more Preston reported to Ellis that the Journal would have no scoop on the Inwood affair.

"Parker, the man you wanted me to hold out on told me all about it voluntarily," Preston added.

"Humph!" grunted Ellis.

"And did you hear about Will Pentnor's return under circumstances that show him to have been no absconder?"

"What's that?" cried Ellis, leaping up from his seat. Then, after Jack had repeated his scant information on the subject, Ellis exclaimed:

"It would have cost me my job here if we had failed to get that! The owner of this paper is a friend of the Pentnors, and he'll want at least a big two-column story on that. I'll rush a special man right out. Where did you hear about it?"

"Parker told me," Preston replied coldly. "It hadn't been turned in to the police yet; the tip came from the Misson district. Parker didn't have to tell me, but he did it for fear we would think he wasn't dealing squarely with us. I can tell you, it made me feel cheap to think that I had had orders to hold out from him on the Inwood affair."

But Ellis, without making any response, hastened outside to find a reporter whom he could rush out to the Pentnor home. Jack Preston walked out into the city room, where he busied himself writing out the few short items he had. He turned this matter in to Ellis, then went back to his desk. He had to remain in the office at least two hours longer, but was through unless police headquarters sent in a call over the fire alarm that should summon him.

Fifteen or twenty minutes pased. Telford had just come in when the buzzer on the phone extension to Ellis' desk was heard ringing.

"Hello!" responded Ellis, audible out in the city room, in a low voice that was quiet "Who is that? Oh—Foster! Weeks since I've heard from you. How's everything?What's that? Say, that's mighty kind of you to send me such a tip. I won't forget it. Don't let a whisper of that get out to any other newspaper, will you? The Journal will want that big yarn all to itself!"

Ellis came out into the city room with leaps and bounds.

"Telford, you're tied up with the story you're writing, aren't you?" asked the acting night city editor. "Preston, I'll have to send you out on this, but I believe you can handle it all right if you keep your head. I wanted a big scoop tonight and now I believe I have it. This also comes in from the Mission district. You've heard of the rich and prominent David Penrose, whose home is at 3162 Gracewood Avenue They came home from the mountains late tonight to find that a secret safe in the house had been looted. Nearly all the Penrose jewels were in that supposedly secret safe. It was opened, probably earlier tonight, and cleaned out. The famous diamond necklace was perhaps the heaviest loss. Mr. Penrose called in the head of a detectve agency, and has made no report to the police yet. Probably the first hint that police headquarters will have will be when it appears in the Journal in the morning. Get a taxi and pay the driver to burn gas out there and back. I'll have the night editor hold two columns for you. Rush it, boy!"

'I'll start in just a minute," replied Jack, a strange look in his eyes. He crossed the hallway to the telephone room, sat down before an instrument, gave a number and waited. Ellis, after a brief, astonished pause, followed.

"Is Parker there?" Ellis heard Preston inquire. "Yes, if you please, and on the jump!"

"What are you doing?" Ellis almost roared, but Preston spoke into the telephone, detailing briefly the tip on the Penrose robbery story.

"Say, what do you mean by that—killing my big scoop for tonight?" demanded Ellis, his face white with passion.

Having rung off, Jack Preston rose and faced him calmly:

"Mr. Ellis, that is really police news, even if the police haven't it yet. It would be most unfair to hold that out from Parker, the man who told me about the Inwood story that you didn't believe the News had. Then he also tipped me on the Pentnor story, and you admitted to me that it would undoubtedly have cost you your scalp if you'd fallen down on the Pentnor yarn."

"Take what you can get from Parker, of course," propounded Ellis, "but you had no right to throw me down on the story I had planned for our big scoop this night!"

"I'll turn in my resignation right now, sir," Preston continued, his own face white, "and you may send some one else out on the Penrose story. Or I'll cover that story and hand you my resignation along with the copy for it. Which do you prefer?"

"Get out on the story as fast as you can," stormed Ellis. "I haven't another man to send. But you'll hear from the chief tomorrow, you may feel sure of that."

"I'm going now," repled Preston. "Probably I can catch Parker and he and I can go out in the same taxi."

Out on Newspaper Row, Jack was in time to see Parker about to enter a taxi. Accustomed to driving newspaper men, the chauffeur stepped hard on the gas. He had taken them a few miles when he neared the first crossing beyond the Terminal Station. The automatically controlled crossing gates were just beginning to lower as an incoming train rolled along. Frantically the crossing tender waved his lantern to stop the taxi, but the driver, finding it nearly impossible to come to a halt in time, decided to take a chance in getting across before the farther gate fell into place to bar their progress. So quickly was the thing done that the descending gate barely grazed the top of the scudding taxi. Half a second later that gate would have blocked their way and they would have been struck by the locomotive.

"This isn't an outing of a suicide club," observed Preston coolly, in response to which the driver turned and grinned.

Out at the home on Gracewood Avenue the story was obtained with a bit of difficulty but with considerable speed. The reporters turned back to Newspaper Row.

Returning to the office, Jack reported to Ellis and received his orders. As fast as he could make his typewriter move he pounded out his story. When he turned the last page in at the night city desk he handed Ellis another sheet of paper.

"My resignation," he announced simply. Ellis tore it into several bits. "When I phoned Logan about your conduct, he appeared to find some excuse for you," explained Ellis. "He told me to nform you that you couldn't resign. He wants you to call him up."

So Jack Preston called up the home of the city editor, Mr. Logan. As soon as the editor recognized Jack's voice, he replied:

'Preston, Mr. Ellis brought his charge against you as soon as you had started for the Mission. Then I called up a minute later and asked if Telford was at the office. He came to the phone and I made him tell me the whole story about Ellis' orders and the way Parker had behaved toward you earlier in the night. He was careful about the way he worded it, but knowing Ellis, it didn't take me long to grasp the situation. I want to tell you that I appreciate what you did in the face of orders that shouldn't have been given. You're of the right stuff. Thank you, Preston, and good night."

When Jack Preston reported for duty the following morning, his first discovery was that Telford, not Ellis, sat at the desk as acting night city editor.

### SAFE METHODS OF HOME CANNING

(Continued from Page 5.)

the time of sterilization 10 per cent for each 500 feet increase in altitude. Example: If time of sterilization at sea level is 90 minutes it would at 3,000 feet altitude be 40 per cent more than 90 minutes or 90+ (40%×90)—90+36=126 minutes. At 3,000 feet, 40 per cent more time is required because this altitude is 2,000 feet above the 1,000 foot level and 10 per cent is added for each 500 feet above the 1,000 foot level. Pressure sterilizers only should be used for high altitudes for vegetables and meats.

#### How To Count Time of Sterilization

Do not count time of sterilization until the water reaches the boiling point, if a hot water sterilizer is used or until the desired pressure is reached in a pressure sterilizer. All other time is not counted. This point is of utmost importance.

# The Old Carriage Maker Had an Important Truth

"To make each part as strong as the rest," was his way of "building a wonderful, one-horse chaise that wouldn't wear out till judgment day."

This illustrates a fact that is keeping many doctors busy these days—human bodies, like chaises, break down because some part isn't as strong as the others.

Very often it's because of ill-balanced food, lacking in some important element of nutrition. This is especially true of ills developed in childhood, and carried on through life.

Grape-Nuts, that world-famous, ready-to-eat cereal, brings the plan of building each part as strong as the rest—to serve human need. Grape-Nuts contains all the nutriment of those best of the field grains, wheat and barley, including the vital mineral elements, and it is a wonderful food for building and sustaining health and strength.

The delicious flavor and crispness of Grape-Nuts make it a welcome dish whenever you're hungry.

## The Cultivator Patterns

**3957. Girls' Dress.**—Cut in 4 Sizes: 4, 6, 8 and 10 years. A 6 year size requires 1⅝ yard of 27 inch material for the guimpe, and 1½ yard of 40 inch material for the "dress." Price 10c.

**3846-3787-3946. Ladies' Sport Suit.**—Blouse 3787 and Guimpe 3846 are cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3946 cut in 6 Sizes: 25, 27, 29, 31, 33 and 35 inches waist measure. The skirt requires 3⅝ yards of 44 inch material. Its width at the foot is about 3⅝ yards. The guimpe requires 3½ yards of 27 inch material and the Blouse 2¼ yards of 36 inch material, for a medium size. Three separate patterns 10c for each pattern.

**3963. Junior's Dress.**—Cut in 3 Sizes: 12, 14, and 16 years. A 14 year size requires 3¾ yards of 27 inch material for the dress, and 1⅝ yard for the cape. Price 10c.

**3967. Ladies' Night Dress.**—Cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size requires 4½ yards of 32 inch material. Price 10c.

**3285. A Simple Set of Hat and Apron.**—Cut in 5 Sizes: 1, 2, 3, 4 and 5 years. A 4 year size will require 2⅜ yards of 27 inch material for the apron and 1 yard for the Hat. Price 10c.

**3949-3947. Ladies' Costume.**—Waist 3949 cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires 2¾ yards of 36 inch material. Skirt 3947 cut in 7 Sizes: 25, 27, 29, 31, 33, 35, and 37 inches waist measure. The width at the foot with plaits extended is about 2½ yards. A 29 inch size requires 2¾ yards of 54 inch material. Two separate patterns 10c for each pattern.

**3955. Boys' Suit.**—Cut in 4 Sizes: 2, 3, 4, and 6 years. A 3 year size requires 1¼ yards of 27 inch material for the entire suit. Price 10c.

**3968. Ladies' Apron Dress.**—Cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size requires 4 yards of 36 inch material. Price 10c.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

**CATALOGUE NOTICE**

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

Country people deserve as attractive home surroundings as do those who live in the city. It is just as easy to make them so. Besides, it pays in dollars and cents.

## HINTS FROM HOUSEKEEPERS

### Cowboy Lecturer Coming to University.

Because of the general interest in cowboy songs published in the Cultivator in recent months a reader has asked us to publish notice that "John A. Lomax, widely known as author of the 'Camp Fire and Trail' ballads and instructor of English in the University of Texas, is coming this year to the University of California Summer Session at Berkeley, to give a series of lectures on Cowboy Life and Literature. Mr. Lomax was raised in Texas, the real cowboy country. He went to Harvard, and there presented his ballads, the material for which he had gathered during his boyhood days. His lectures will cover Cowboy Songs, Cowboy Verse, and Negro Spirituals."

### Hints From a Woman Who's a "Handy Man"

My Baby's Bed.—I made a bed for my baby which gives him a great deal of protection and comfort. It is 27 by 50 inches, but the size should be decided by the width of the doors and the length in proportion. I bought rough lumber and did the planing myself, not forgetting to round all corners and edges. I bought 2 by 2 for the corner posts, 1 by 2 for the spring to rest on, and 1 by 1 for the sides. The corner posts are 36 inches high. To the centers are fastened the 1 by 2, and 1 by 1 to the top with three 1 by 1 fillers in each side and one in each end. I used screws throughout for fastening it together. One side is made separate, swings on hinges and fastens with hooks. To the bottom I tacked screen for a spring. However, it would be much better to buy a spring as a foundation of your work, or to cut a suitable one from an old one if available. To the sides I tacked, on the inside to save bumps, 18-inch screen. I also made a cover of screen, hinged to the stationary side, and to hook over. Then I fastened wheels from an old wagon to the legs, and lastly gave it all a coat of paint. When he is in his own little private car he goes wherever he is most comfortable, or happy, outdoors or in. Flies or mosquitos cannot annoy him, and if the wind is too strong it is easy to put a sheet to the windward or over the top to keep out the sun. This canvas sheet has rings sewed to the edges which slip over hooks properly placed. The bed also keeps Baby off the floor from drafts and hot stoves in the winter. My baby is now 16 months old and still sleeps in it. And all that comfort and safety can be built for five dollars or less, according to how much old material is worked over.

Covering Coolers.—Anyone who covers a cooler two or three times a year knows what a task it is and also its condition after the tacks have been put in and removed several times. I no longer do this. Instead, I have put staples about half way in every three inches where I used to put tacks. I press the burlap over these, slip a stout cord through the staples from one to the other and my cooler is covered in half an hour, and the cover is removed in a few minutes. My cooler is a screen covered wooden frame, which I give a good coat of paint before starting the season. This keeps it in good condition several years.—Mrs. L. A. Ward, Valley Home.

*Kodak on the farm*

Kodak does double duty on the farm. Pictures like the one reproduced above—that's pleasure.

A photographic record complete even to the date and title of crops, stock, buildings and equipment—that's business.

In either capacity it serves you well.

# EASY NOW TO RID YOUR PLACE OF FLIES

**Widely Known Scientist Discovers Wonderful Chemical That is Fatal to Flies. Not a Poison—Harmless to Stock.**

Flies are one of the most dangerous and annoying things with which the farmer has to contend. Now, through the discovery of E. R. Alexander, widely know scientist, you can rid your house and barns and livestock of these pests almost instantly, and with no trouble at all. This discovery is in the form of an organic chemical that is fatal to flies, and similar pests, such as chiggers, mosquitoes and moths.

This new discovery, which is called Alexander's Rid-O-Fly, is not a poison. Though it kills flies like magic, farm animals and human beings are not affected by it at all. In addition to killing these insects, Rid-O-Fly is a strong repellant. Flies will not come near stock or buildings where Rid-O-Fly has been used. Rid-O-Fly is particularly valuable for cows and horses, as it is a known fact that flies do untold harm to these animals.

So confident is Dr. Alexander that his discovery will rid your house, barns and live stock of these pests that he offers to send a $2.00 supply for only $1.00 on the guarantee that if Rid-O-Fly does not solve your fly problems it will cost you nothing. Two big Kansas City banks guarantee the reliability of this offer.

SEND NO MONEY—just your name and address to the Alexander Laboratories, 1577 Gateway Station, Kansas City, Mo., and this introductory offer will be mailed at once.

By E. J. Sturgis

## GENERAL DAIRY FEEDING

CONSIDERING that the dairyman has assembled the best herd of cows that he can afford, the next problem is to make it produce the maximum of milk at a minimum of cost and still keep in good health and retain its reproductive powers unimpaired.

As a specific example of care and feeding, let's consider that the cow has finished one lactation period and is resting in preparation for calving and the beginning of another. Cows in an ordinary herd do not need the special attention accorded the ones being groomed for attempts at high records but the general treatment is very much the same.

### Drying Up

First the cow should be given a rest of at least six weeks before calving. If she is still milking heavily at drying up time and appears to want to continue to do so, take all of her feed away and give her nothing but a small bit of barley hay and some water once a day. Milk her once a day as long as she continues to give two gallons or more. As the flow of milk lessens extend the time between milkings until she is dry. Occasionally a cow refuses to dry up completely and if you get one like this continue milking her and giving her very light feed.

### Feeding Dry Cows

As soon as she is completely dry begin feeding a ration of equal parts of ground oats, bran, corn meal, dry beet pulp and linseed oil meal. Beginning with a small quantity this can be increased up to 15 pounds a day. Two weeks before calving change the ration to equal parts of oats and bran with a handful of oil meal at each feeding. If green alfalfa is to be obtained include an equal part of dry beet pulp in the ration, but if not, feed about 18 pounds of soaked beet pulp a day. The green alfalfa or the soaked beet pulp tone up the digestive system and keep the organs loose and relaxed. At the same time feed plenty of good alfalfa.

### Care at Calving

When the cow shows signs of calving take all feed away except a small amount of wet beet pulp and bran. After calving give her a good feed of hot bran mash and plenty of warm water. For the first three days give bran and beet pulp the same as before calving.

At the end of three days the swelling in the udder should be somewhat reduced and she should begin to crave her food. Beginning slowly feed the following ration: 100 pounds bran, 100 pounds ground barley, 100 pounds ground oats, 50 pounds coconut meal, 50 pounds linseed oil meal.

Feed this grain mixture 1 pound to each 4 pounds of milk she yields. At the same time begin to feed silage in small quantities and increase the amount up to 35 pounds a day.

Every dairyman should be equipped to feed silage as it is one of the best and cheapest feeds obtainable. At the present time the cost is about $7 a ton which makes it comparatively inexpensive. If silage is not to be had feed soaked beet pulp in its place.

From 10 to 15 pounds of the soaked pulp is the most that should be fed.

It is desirable to have the grains—barley and oats—ground in a feedmill and to be what is called "three-quarter" ground.

### Cow Testing

No dairyman should attempt to do business without being a member of his local cow testing association. Very few men are equipped to weigh and test their milk on their own hook and the cow testing associations are formed to provide this service at the least cost to them. Probably not one man in a million can estimate a herd's ability in production by looking at it. The milk scales and the Babcock test furnish the only means by which an accurate estimate of a cow's production can be made. Knowing the feed cost and having the production record it is easy to determine which cows are making money for the owner and which are merely boarders.

Cow testing certificates are of great value when cows are offered for sale as they provide a record of production which is accurate to within five per cent, and most of the associations furnish them.

### Lessons From Experience

Experience has proved that high producing cows make the biggest percentage of profit for the owner. A recent investigation made by the U. S. department of agriculture shows that cows having high average production of milk and butter fat averaged high in income above feed cost regardless of breed, age, weight, date of freshening, and geographical location. The cows having an average milk production of 3,250 pounds had an average income of $32.25 over cost of feed, while the cows having an average milk production of 13,250 pounds had an average income of $218.19 over cost of feed. The average production per cow in the latter group was about four times as great and the average income over cost of feed was nearly seven times as great as in the other group.

## CALIFORNIA HOLSTEINS STAND FIRST

Some interesting facts are brought out in the annual prize list for 1921-22 of cows winning cash for high production, sent out by the Advanced Registry office of the Holstein-Friesian Association of America. The California breeders as usual have carried off a large share of the honors. The four leading states from the standpoint of the number of times they appear in the prize list are Wisconsin, New York, California and Minnesota. In the short time tests (7 and 30 days) California is second. In the 305 day test California leads all other states. Not only is California a leader in the numbers of places won on the prize list but breeders of this state hold both first and second place in the number of first places won.

Bridgford Holstein Co. of Patterson, is the leading winner of prize money and for number of first places, with 11 firsts out of the 70 divisions and classes. A. W. Morris and Sons Corporation of Woodland comes next to the Bridgford Co., with five firsts out of the 70 divisions.

California for the second time carries away first place in prizes over all states, having 11 first prizes for butter and nine for milk.

## Livestock News Notes

Guy H. Miller of Modesto, the well known Jersey breeder, represented California at the fifty-fourth annual meeting of the American Jersey Cattle Club held at Hotel Astor, in New York City, June 6. Mr. Miller also took in some of the Eastern Jersey sales and comes home with an "eye full" of Eastern Jersey type.

O. H. Marvin of Pomona, is fitting a fine string of Duroc-Jersey hogs for the fall fairs. He will show a good son of the Ace of Pathfinders and several spring pigs sired by a son of the Ace and out of Model Defender sows.

L. E. Sheets of Pomona, expects to exhibit some of his Hampshire sheep this fall. Mr. Sheets has been developing a flock of high class Hampshire sheep on his Pomona orange grove for a number of years. Sheep growing with Mr. Sheets is for the double purpose of producing top breeding sheep and furnishing fertilizer for his citrus grove. Incidentally Mr. Sheets is one of the moving spirits in the forthcoming Los Angeles County Fair to be held at Pomona this fall.

Imp. Nancy II of Les Meriennes, a Guernsey cow owned by J. A. Brown of Capitola, Santa Cruz County, has finished a year's test with 670 pounds butter fat. This is the first cow in the herd to make an A. R. record since Mr. Brown has owned it, and other records equally as good or better are on their way.

The committee on judging and classification, appointed at the 1921 national convention of the Holstein-Friesian Association of America, held an all day session Tuesday of convention week. This committee is putting over one of the most constructive pieces of work ever attempted by a national breed association. It is working out methods that will in a tangible way fix a definite Holstein type for both cows and bulls. A noted sculptor and a noted painter were secured to put on canvass and model in clay animals that embody the combined opinions of the committee and composite outstanding desirable points in the noted winners in the big shows during the past few years. The model of the cow and bull have been completed

and if accepted by the association will be supplied to colleges and breeders.

The Burr Farm sale at Los Angeles, June 1 and 2, indicated very clearly the present situation as far as tuberculin tested registered Holsteins of substantial breeding and acceptable type are concerned. With 31 buyers absorbing the offering at an average of $420 per head, the strength of the market for this class of cattle is fully apparent.

George Wendt, Madera, is planning extensive development of Wendwood herd of registered Holsteins, which now numbers about 60 head. Many of these were famous record cows in the former herd of Toyon Farm Association. Mr. Wendt is also planning to furnish milk to the retail trade in Madera. The herd includes among its younger members several splendid danghters of Sir Aaggie Mead.

George L. Stearns, well known Holstein man, formerly in charge of the great Vina Ranch herd, owned by Stanford University, is now permanently located at the head office of The Lewis Company at San Jose.

Donnybrook Ladysmith Johanna, owned by Bridgford Holstein Company, Patterson, has just completed a record of 34.00 pounds butter from 774.2 pounds milk in seven days. She is a daughter of Sir Colantha Prilly, whose sire is by Colantha Johanna Lad and out of the famous foundation cow, Changeling, and whose dam is a daughter of Joe Gelsche De Kol Burke, son of the great foundation cow, Prilly.

Report of the cow testing association of Kern County for May shows 843 cows tested with an average of 27.1 pounds butter fat from 687.5 pounds milk. 105 cows produced more than 40 pounds butter fat for the month. The high cow was a grade owned by P. G. Grundt of Wasco, who milked 1392 pounds and made 80.7 pounds fat.

The futurity classes for spring pigs at the Southern California Fair have been filled in all breeds except the Durocs.

H. G. Stibbs of the Carnation Stock Farm at Seattle has been spending some time in Southern California in the interests of the Pacific International at Portland of which he is director of publicity. He promises the greatest livestock show in its history this year as additional units of the building now under construction will provide over ten acres under one roof.

In a recent compilation of data showing the relative standing of various dairy herds in agricultural colleges, the University of California ranked a strong third amongst the colleges of the country, with Illinois and Nebraska leading. None of the other colleges show an outstanding leadership in the case of any one breed as California does in the case of Jerseys.

## PUBLIC SALES OF HOLSTEINS

The public sale season for the first half of 1922 is now over and some interesting figures are found in the records of this year's sales conducted by the California Breeders Sales and Pedigree Company, in California.

Tuberculin tested Holsteins: 20 bulls sold for $12,670, an average of $633; 228 females sold for $73,960, an average of $324.

Holsteins sold without tuberculin test: 99 bulls sold for $7,442.50, an average of $75; 245 females sold for $29,535, an average of $120.

Grand total, 248 tuberculin tested Holsteins sold for $86,630, an average of $349; 344 Holsteins sold without tuberculin test for $36,977.50, an average of $107. 20 reactor cows and heifers sold for $2,985, an average of $149.

The bare figures showing the wide spread in prices between tuberculin tested cattle and those sold without test does not reflect the actual condition, as it so happens that of the total of 612 head sold nearly 30 per cent were in one herd and sold in one sale without tuberculin test, including a very large percentage of young heifers and an abnormal number of young bulls. It may be accepted as a fact, however, that buyers are properly showing increasing preference for tuberculin tested cattle and that from now on the spread in values between those sold tested and those sold untested will be much greater than in the past. The spring sales ran higher in percentage of cash to notes than in any previous season in the experience of the company and in practically every sale prospective buyers went home without cattle. The season closed with an exceptionally strong demand that promises to carry over until the fall to a still stronger demand that promises to carry over until the fall to a still stronger demand for good cattle.

## MAKING FUTURE PUREBRED BREEDERS

At a recent meeting of the board of directors of the Holstein-Friesian Association of America, it was voted in the interests of calf club work to extend the following privileges to calf club members:

Any boy or girl owning a purebred Holstein-Friesian calf club calf duly registered under his or her name shall after completing a season of work under the club leader be given a membership in the Holstein-Friesian Calf Club Association of America. This membership shall continue until the boy or girl is 19 years of age. The benefits of this membership are as follows: membership rates of registration and transfer of all animals connected with calf club work including offspring of such animals.

In addition all junior members will receive literature of value in the raising of their calves as well as news items of interest concerning their breed.

Boys and girls become candidates for the junior organization when they join their local Holstein calf club. On receipt of their names and addresses a black and white candidate badge is mailed to them. When the club leader and Holstein official have signed the statement of faithful work the neatly engraved certificate of membership is granted. It is expected that fully 3,000 young people will soon be enrolled as candidates.

More than ever the young people are getting into calf club work. Splendid calves can now be purchased at a reasonable rate and feed is not too high. A number of states are making plans for extensive calf club drives this fall. Among these are Illinois, Indiana, North Dakota, South Dakota, Iowa and Missouri. The New England states are also looking forward to more of this good work.

## BEST COWS ARE CHEAPEST

If there is one thing to be learned from the experience of cow testing associations it is the contrast between the comparatively low cost at which the good cows produce milk and butterfat and the high cost of everything the farmer gets from the low producing cow.

Cows producing more than 8,000 pounds of milk and 400 pounds of fat a year did so at a feed cost of 17½ cents a pound.

Cows averaging 5969 pounds of milk and 300 pounds of fat did so at a feed cost of 21 cents a pound.

Cows averaging 4428 pounds of milk and 200 pounds of fat did so at a feed cost of 23.3 cents a pound.

Cows averaging 2339 pounds of milk and 100 pounds of fat, did so at a feed cost of 37.3 cents a pound.

In labor cost, interest and overhead the difference is even more striking. The 100 pound cow returns a pound of fat for every 2.60 days of care, the 200 pound cow returns a pound for every 1.48 days, the 300 pound cow for every 1.04 days, and the 400 pound cow for every 0.74 day.

## IMITATION MILK IN THE COURTS

Test cases are being brought in Oregon and Utah by manufacturers of imitation dairy products to avoid the requirements of state laws which have been adopted compelling truthful advertising methods in advertising these products. Next to truthful labeling no statute will be more effective in protecting the dairy industry from oleomargarine, filled milk and other imitations than truthful advertising laws and their honest enforcement. The dairy industry will watch the progress of these cases through the courts with much interest.

## THE HOG LOUSE

The hog louse is one of the largest of this family infesting domestic animals, adults reaching a length of one-fourth inch or more. For this reason, and because of the thinness of the hair on hogs they are conspicuous. The prevailing color is gray, and the body is broadly elliptical, while the head is decidedly pointed. These lice congregate behind the ears, along the back and inner surfaces of the thighs. As a rule when swine are seen rubbing or scratching themselves, lice are present.

Hand application of either of the following is effective: Kerosene emulsion, crude petroleum, equal parts cottonseed oil and kerosene, kerosene and lard in proportion of one-half pint kerosene to one pound lard. Any of these may be used on rubbing posts. For wallows and dips use crude petroleum, about one pint for each pig and one quart for each hog.

## HARTSOOK COW BREAKS ANOTHER WORLD'S RECORD

Rosamaines Korndyke Beauty, the remarkable heifer who made 22,750 pounds milk in 305 days as a senior yearling and who made 34.22 pounds butter in seven days at a recent freshening at three years and eight days of age, was run for a second seven day period and made 779 pounds milk, which betters the previous world's record by 22 pounds.

# Lost! 10 Million Dollars A Year

## By American Butter-Fat Producers

It has been estimated by the Department of Agriculture that ten million dollars a year are being lost through the production of low score butter. With high quality cream your creamery can make higher score butter, which not only commands a higher price but is in greater demand; therefore they can afford to pay you more.

One of the greatest aids in producing high quality cream is a clean separator. The De Laval is exceptionally easy to keep in a clean condition, and in addition it will

—skim cleaner for many more years than any other;
—skim milk clean at lower temperature than any other;
—deliver a higher testing cream, which is more acceptable to the creamery and easier and less costly to ship;
—and deliver a cream which will make better butter.

A De Laval also lasts longer and turns easier than any other. Built in a variety of sizes, with hand, power or motor drives. See your De Laval Agent now about getting a new De Laval. It will soon pay for itself. Sold on easy terms.

**De Laval Pacific Company**
**61 Beale Street San Francisco**

The De Laval bowl is as simple and easy to clean as a teacup. It is completely unassembled in cleaning, and every part is smooth, visible and easily reached. The whole bowl is thoroughly washed in a few minutes.

The bowl shell is a single piece and the combined bowl bottom and central feed shaft is a single piece. The discs are very quickly cleaned and easily handled with a simple transfer device. This device, which permits of washing and rinsing the discs as a single piece, is a very great convenience and its use is restricted to De Laval machines.

How to Stop
**Calf Scours**

You can do it in a quick simple reliable way—costs little. One good calf saved will repay the expense of protecting your whole herd for a long time against this infectious disease.

Leading breeders and dairymen throughout the country say there is nothing like B-K. It contains no poison or acid—It is clear as water and safe to keep anywhere.

B-K acts as an anti acid and sweetner in stomach and also quickly kills the germs that cause scours or diarrhoea. It heals the inflamed membranes, relieves irritation and restores healthy action.

*SAVE EVERY CALF*

It's so simple to keep your barns sanitary and your animals in a healthy condition. B-K also prevents such germ diseases as Abortion, Retained Afterbirth, Barrenness, Calf Pneumonia, and you have this wonderful help all in one bottle—always ready.

Keep a supply of B-K handy for all the "little ills" of the barn—cuts, scratches, anything where infection can do harm.

## SIDELIGHTS ON THE L. A. UNION STOCKYARDS

(Continued from Page 3.)

ment. Another is the man who in directly enabled and advised those cattle, sheep and land loans and bond issues that saved the hides of a few hundred livestock producers in the last two years. Several were heavy subscribers to the first fifty millions lent two years ago to cattlemen, and later helped secure the war finance loan plan. Some of these men indirectly helped pour money into this Southwest that through some large banks saved many country banks and thereby lessened a hardship upon many communities.

The industrial development that will be established does not interest the livestock producers beyond the better facilities afforded through them, but actual savings are possible owing to it. One thing is promised, and that is terminal rates direct to the stockyards and no switching charges. A readjustment of rates is certain upon feeders and cattle in transit through Los Angeles stockyards, that will greatly benefit our great feeding districts like Imperial Valey. All cattle will be sold on a fill. There is every assurance that the saving to producers on switching, the $2 per head cattle buying expense of packers, new rates and sale on fill instead of shrunk, will more than compensate for yardage feed and commission charges. Whether at present packer or producer pays all or part of expense now is irrelevant as granting a fair intention on the part of any killer; beef price to producer is figured upon carcass meat selling prices, offal and hide and its expense total

The yardage charges will run approximately 30 to 35 cents on cattle, 10 cents on sheep and 12 cents on calves and hogs. The feed charges will be based upon actual hay and grain cost. The commission charges are low but associations can completely abolish them through cooperative brokerage if so desired, so they are not pertinent.

That in trading there will be no effort to limit or monopolize privileges among a few is the direct assurance of McNaughton, beyond the limits of character of traders. There will be required a standard of dealing and ethical conduct as protection of producers against men of crooked intention.

Most stockyards have an exchange Cattle are sold through the commission members of the exchange. The new federal laws require filing in the proper government department list of fees, name and license for all brokers in stockyards.

McNaughton says he will protect producers to his power limit and see that no crooks infest the yards, and I believe he means it. One of the little points in this stockyards deal that I shied at was the possibility of livestock sale manipulation where dealers were required first to have a federal license, and next an exchange right, and that was the control or limit to a few or a few dozen chosen buying and selling brokers of the trading right. This monopoly might be accomplished through curtailed space through an exorbitant exchange membership fee or a dozen other methods where such an intention existed, and for the producer it would avail little if his selling came through a bunch of brokers who could not give proper protection service. I am satisfied that McNaughton plays a straight clean game and will give in due course proper guarantees and assurances relative to many of these small points when stockyards operation is imminent. We want a yards but we want it right to start with, as it will save much trouble later.

In general one of the main objects aimed at is a swine increase for California and improvement in the cattle of this Southwest. The last winter showed most of us that we had a long way to go in breeding up before we equalled the North or Middle West in cattle quality, and that we were not making the best of our California and Southwest facilities to produce the best cattle.

How the swine increase will come with the Middle West growing hogs on 50 cent corn and the West on $1.50 barley remains to be seen. Alfalfa feeding with ground milo topping may do it, or a further advance in our methods when a definite market is assured. Grape residue can be secured in parts of the country, and mast and natural range will carry the hogs part of the year in other districts.

There is always an economy in feeding cost where an immediate sale is certain when hogs are fat, and it is quite certain farmers will be able to get the money to buy hogs if they have the feed. It will promote a keen and expert interest in the source of the money, in vaccination and proper methods for good feeding. If the farmer loses money he won't repeat and if swine production is to be built up he will have to repeat and increase, which is only possible through a profit on the deal. Personally I believe we are going to see the fairest market in this U. S. A. right here and a new cooperation between packers and producers, for these packers realize shortage in cattle, sheep and swine is a menacing possibility that will make it bad business to raid the market price.

If we can raise the meat in this Southwest instead of shipping it in the entire district of our market will prosper, and it can't be raised without a living profit. Everywhere in the Middle West a great bulk production is achieved through the multitude of small men instead of a few large producers. The small man here could not afford to bother with a few cattle, sheep or swine that took cash to buy and brought a gambler's result, with the odds in favor of a loss. The ordinary man couldn't figure to use even waste feed for a bunch of steers that he might have to hold over three months for an uncertain sale. Livestock should be the mortgage lifters on the ordinary farm, but the way things have been the small man was subjected to the will of local butchers peddlers, and commission killers, and they were mortgage makers instead

## MEETING OF SOUTHERN CALIFORNIA PUREBRED LIVESTOCK ASSOCIATION

On Saturday, June 24, the members of the Southern California Purebred Livestock Association were the guests of Mr. and Mrs. Dave Maxwell at Maxwell Farms. After inspecting the stock and buildings at this great Holstein plant the members were seated under the walnut trees adjoining the dairy plant and served with a most excellent barbecue lunch. After luncheon the regular monthly meeting was held in the walnut grove. H. Michel, president of the association, presided, and after disposing of the routine business called on several speakers who discussed subjects interesting to the livestock breeders. Dr. E. M. Keef of the veterinary department of the state department of agriculture, explained the federal accredited herd system as it applies to California. Dr. Keef stated that the California department of agriculture was now prepared to receive applications under the federal accredited herd plan and asked the cooperation of the dairymen in building up this branch of the tuberculosis eradication work.

This was referred to the legislative committee of the association with instructions to report at the next regular meeting.

J. A. McNaughton gave a very interesting talk on the plans for the Union Stockyards to be built in Los Angeles this summer. All those present expressed themselves as heartily favoring the plan. H. A. Miller, livestock expert of the Los Angeles chamber of commerce, followed Mr. McNaughton with an endorsement of the stockyards and outlining a plan for advancing the livestock business in the Southwest. Mr. Miller also announced that the directors of the chamber of commerce had indorsed the Southern California Fair at Riverside and asked that breeders in Los Angeles County support this fair.

G. E. Gordon gave an instructive talk on selecting and fitting animals for exhibition.

R. A. Condee, who was the California delegate to the National Holstein-Friesian Association at Kansas City, gave a talk on the livestock conditions in the corn belt.

Secretary W. W. Van Pelt announced that the next meeting would be held at the Clark Hotel, Los Angeles, July 22.

## HOG AUCTION DATES

Hog auction sales will be held at Wasco, July 1; Modesto, 5; Chowchilla, 6; Fresno, 7; Tulare, 11; Visalia, 12; Hanford, 13; Corcoran, 14; Bakersfield, 15; Merced, 18; Turlock, 19; Madera, 20; Fresno, 21; Tulare, 25; Visalia, 26; Hanford, 27; McFarland, 28.

## NEWS ITEMS

G. T. Drinkwater of Lakeside has assembled a fine herd of pure bred Guernseys on his San Diego County farm. Mr. Drinkwater plans to sell his fine herd of grade Holsteins and specialize on Guernseys.

Johnson Brothers of San Diego who recently turned from dairying to hog raising, have gotten together a fine bunch of Polands with Liberator Boy at its head. They have a fine futurity litter sired by Fred Gatewood's Navy Boy who was grand champion everywhere last year. Johnson Brothers plan to show considerably this fall.

W. H. Rough of Arlington, a well known Poland China and Jersey breeder, was burned so severely by an exploding gasoline torch that he died on June 22.

W. H. Dupee is planning a model milking barn and creamery on his Rosemoor Farm at Riverside. Recent purchases of Guernseys at public and private sale in the Middle West bring Mr. Dupee's herd up to over 25 females of the highest type and production.

## ANIMAL GLANDS

Within the last 15 years there has grown up in this country a highly diversified industry in the manufacture of products from the various glands of domestic animals that are slaughtered in the large meat packing plants. According to the bureau of chemistry of the United States department of agriculture rennet and pepsin were the first substances of this nature produced under commercial conditions. Shortly after the introduction of these first products came the manufacture of pancreatin and later extract of the thyroid gland.

Pharmaceutical houses making these and other preparations get the raw glands from the packers, but a number of the latter are now making the finished products in their own plants.

Stable flies are the cause of much discomfort and annoyance to livestock and of financial loss to the owner. Keep the stables, poultry houses pig pens, etc. clean and avoid the accumulation of manure or filth. Provide screens for doors and windows. Spray the animals lightly each morning with a mixture of the following proportion: Five gallons kerosene, one pint either oil of mirbane, oil of tar or cresylic acid.

That "an ounce of prevention is worth a pound of cure" is exemplified in cases where common and notorious pests of domestic animals are permitted to thrive unmolested when a few cents expended for deterrents or repellents, would reduce their activities.

# Calciphile and Calcifuge Vegetation

By R. R. Snowden

THESE terms have been misused in most cases of their application, for nearly all the experimental work done with lime, so far as I can learn, has had the one object in view of neutralizing soil acidity, and for this purpose simply any antacid not otherwise inhibited would do just as well. But, since all but a few low plant forms cannot develop without calcium, this element becomes in addition a true fertilizer where it happens to be deficient in the soil. On this account the true calcifuge (lime-fleeing) plants are few in number.

The following list of plants from a Rhode Island bulletin, showing their response to liming, has reference to the result of correcting the soil acidity. Those crops which were benefited most are marked by figure "3", and those benefited in lesser degree by figures "2" and "1" respectively. A large number of crops tolerate a moderate degree of acidity; these are marked by the figure "O." A few thrive much better without the addition of lime and these are marked by "(-1)."

Miscellaneous Crops: 3 Asparagus. 2 Australian Salt Bush. 3 Barley. 0 Beans. 3 Beets. 2 Broccoli. 1 Brussels Sprouts. 1 Buckwheat. 2 Cabbage. 1 Carrots. 2 Cauliflower. 3 Celery. 2 Chard. 0 Chicory. 1 Collards. 0 Corn. 0 Cotton. 0 Cowpea. 0 Cress. 1 Cucumber. 1 Dandelion. 2 Egg Plant. 1 Endive. 2 Emmer. 0 Flax. (-1) Furze. 3 Gumba. 2 Hemp. 2 Horse Radish. 1 Kale. 1 Kohl Rabi. 3 Leek. 1 Lentils. 3 Lettuce. 0 Lupines. 2 Martynia. 0 Millet. 2 Muskmelon. 2 Mustard. 1 Oats. 3 Onions. 0 Parsley. 3 Parsnip. (-1) Peanut. 1 Peas. 3 Pepper. 0 Potato. 1 Pumpkin. 0 Radish. 2 Rape. 1 Rhubarb. 3 Rowen. 0 Rye. 1 Sainfoin. 3 Salisify. (-1) Scotch Broom. (-1) Serradella. 2 Sorghum. (-1) Sorrel. 3 Spinach. 1 Spurry. 1 Squash. 1 Sunflower. 1 Tares. 3 Tobacco. 0 Tomato. 0 Turnip. 0 Vetch. (-0) Watermelon. 1 Wheat.

The lists following show my own classification as to benefit, derived from their detail report:

### Trees

Apple, Baldwin, very slight; Golden Sweet, very slight. Birch, American White, none. Cherry, Black Tartarian, very slight; Early Richmond, very slight. Elm, American White, very slight. Linden, American, very slight. Maple, Sugar, doubtful. Peach, Early Crawford, slight. Pear, Bartlett, injured. Plum, Burbank Japanese, very slight. Quince, Orange, moderate. Spruce, Norway, injured.

### Small Fruits

Blackberry, Snyder, doubtful. Cranberry, American Bell, injured. Currant, Prolific, much; White Dutch, much. Gooseberry, Smith's Improved, somewhat. Grape, Concord, somewhat. Delaware, decided. Raspberry, Blackcap, injured; Cuthbert (red), decided. Strawberry, somewhat.

### Grasses

Awnless Brome (Bromus inermis), decided. Kentucky Blue (Poa pratensis), decided. Meadow Fox-tail (Alopecurus pratensis), decided. Meadow Oat (Avena elatior), somewhat. Meadow Soft (Holcus lanatus), decided Orchard (Dactylis glomerata), decided. Redtop (Agrostis vulgaris), doubtful. Rhode Island Bent, (Agrostis canina), doubtful, Sheep's Fescue (Festuca ovina), somewhat. Sweet Vernal (Anthroxanthum od. puelli), Doubtful. Tall Fescue (Festuca elatior), decided. Timothy (Phleum pratense), decided.

### Clovers

Alfalfa (Medicago sativa), decided Alsike (Trifolium hybridum), positive. Berseem, Egyptian (Trifolium Alexandrinum), decided. Bokhara, Sweet (Melilotus alba), decided. Chinese, Milk Vetch (Astragalus sinicus), positive. Crimson (Trifolium incarnatum), decided. Hungarian (Trifolium Pannonicum), positive. Japanese (Lespedeza striata), positive. Red, Mammoth (Trifolium medium), positive; Medium (Trifolium pratense), positive; Illinois, positive; Ufa Russia grown in Oregon, decided; Orel Russia, decided. Red Berne, Switzerland, decided. White (Trifolium repens), decided. Yellow Suckling (Trifolium filiforme), decided, Yellow Trefoil, Black or Hop Medick, (Medicago lupulina), decided.

In considering lime from the standpoint of its functions in the plant, the real data necessary are the amounts of lime contained in the plant. The following list is the average lime content of the various materials shown. Without considering the soil reaction at all, these figures fairly represent the relative need of lime by various plants mentioned, the figures in each case being per cent of lime (dry basis). Following is list of plants tested, character of material analyzed, per cent lime found:

### Legumes

Alfalfa, (Medicago sativa). Plant in bloom. 3.00.

Clover, sweet, (Melilotus alba). Hay. 1.94.

Clover red, (Trifolium pratense). Plant in bloom. 2.40.

Clover, mammoth (Trifolium medium). Plant in bloom. 2.09.

Clover, alsike, (Trifolium hybridum). Plant in bloom. 1.62.

Clover, crimson, (Trifolium incarnatum. Plant in bloom. 1.92.

Clover, white, (Trifolium repens). Plant in bloom. 2.21.

Clover, Japanese, (Lespedeza striata). Plant in bloom. 1.28.

Beans, (Phaseolus vulgaris). Vines 1.32.

Cowpeas, (Vigna unguiculata). Hay, 2.70.

Lupine, blue, (Lupinus hirsitus). Hay. 1.05.

Peas, garden, (Pisum sativum). Vines. 3.12.

Peanuts, (Arachis hypogaea). Vines. 2.08.

Soy bean, (Glycerine hispida). Hay. 2.76.

Serradella, (Ornithopus sativus). Plant in bloom. 2.19.

Vetch common, (Vicia sativa, Green plant. 1.96.

### Non-Legumes

CEREALS

Barley, (Hordeum sativum). Before bloom. 0.95.

Buckwheat, (Fagopyrum esculentum). In bloom. 3.33.

Corn, (Zea mays). In bloom. 0.83.

Oats, (Avena sativa). Before bloom. 0.53.

Rice, (Oryza sativa). Entire plant. 0.23.

Rye, (Secale cereale). Before bloom. 0.51.

Wheat, winter, (Triticum vulgare). Before bloom. 0.48.

HAY AND PASTURE GRASSES

Italian rye-grass, (Lolium Italicum). Hay stage. 1.07.

Johnson-grass, (Sorghum halepense). Hay stage. 0.62.

Kentucky blue-grass, (Poa pratensis). Hay stage. 0.42.

Meadow Fescue, (Festuca pratensis). Hay stage. 0.57.

Millet, (species not stated). Hay stage. 0.46.

Orchard-grass, (Dactylis glomerata). Hay stage. 0.46.

Perennial ry-grass, (Lolium perenna). Hay stage. 0.64.

Redtop, (Agrostis vulgaris). Hay stage. 0.57.

Timothy, (Phleum pratense). Hay stage. 0.71.

FIBER CROPS

Cotton, (Gossypium hirsutum). Entire plant. 0.75.

Flax, (Linum usitatissimum). Entire plant. 0.75.

Hemp, (Cannibis sativa). Entire plant. 0.76.

MISCELLANEOUS CROPS

Hops, (Humulus lupulus). Entire plant. 2.30.

Potato, common, (Solanum tuberosum). Vines, 2.80; Tubers. 0.10.

Potato, sweet. (Ipomoea batatas). Vines. 1.70.

Rape, (Brassica napus). In bloom. 1.78.

Sugar beet, (Beta vulgaris). Leaves. 3.00; Roots. 0.23.

Sorghum, (Sorghum vulgare, saccharatum). Entire plant. 0.26.

Sugar cane, (Saccharum officinarum). Entire plant. 0.19.

Tobacco, (Nicotiana tabacum). Entire plant. 3.40.

Turnip, (Brassica rapa). Leaves. 3.83; Roots. 0.85.

GARDEN CROPS

Cabbage, (Brassica oleracea, capitata). Leaves. 5.93; Heart. 1.17.

Carrot, (Daucus carota). Leaves. 4.45; Root. 0.62.

Cauliflower, (Brassica oleracea, botrytis). Leaves and stalk. 2.04.

Cranberry, (Vaccinium macrocarpon). Leaves. 0.40; Fruit. 0.03.

Celery (Apium graveoleus). Young shoots. 1.88.

Grape( Vitis). Leaves. 2.55.

Kohl-rabi, (Brassica oleracea, caulorapa). Leaves. 4.64.

Lettuce, (Lactuca sativa). Head lettuce. 2.65.

**Victory Tree Spray**

April 25th, 1922.

Victory Tree Spray Co.
Pomona, California.

Attention, Mr. Pinckney.

Gentlemen:—

In reply to your inquiry regarding the spraying you did for us last season, will say that Mr. J. Bolser, the Deputy Horticultural Commissioner for this district, has just finished inspecting my grove, and reported to me that the grove is very clean, and says that I got at least a 95% kill, without doing any noticeable damage to the tree.

Yours Truly,
ALBERT H. MORGAN,
Secretary.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Silage Corn

What is the best variety of Indian corn to plant for silage in the Sacramento Valley?—H. T. B., Sacramento.

Mexican June will stand the hot dry unirrigated uplands better than any yet tested. Under normal conditions throughout the state Eureka Ensilage and Orange County Prolific have both made prodigious growths with irrigation. In parts of the valley hot winds adversely affect corn, and the earlier varieties are nearly beyond the "injury" season (early July) when these winds come. Other early varieties for general purposes are: Early Tuscarora, Gehu, and Red Dent.

### June Drop

What makes lemons and oranges drop when they are the size of peas and hazel nuts? What time should they be watered? What do you do for mildew?

There are a number of causes for the dropping of oranges and lemons at this particular stage and without seeing the condition of the trees it is rather difficult to say what causes it in your particular case. In the first place there is a natural thinning of all citrus fruits when they are about this size as the tree nearly always sets more fruit than it can mature and the weaker fruits drop off. Under normal conditions there are always plenty of fruit left on the tree but if it is not in a healthy condition all or nearly all of the fruit may drop. A lack of water or extreme hot weather may cause an excessive dropping of the fruit. There are also scale and fungus conditions that have the same effect. Allowing the trees to get a little too dry before irrigating will oftentimes cause nearly all of the fruit to drop.

Local weather conditions determine the time for watering citrus trees, provided of course that the trees have received proper cultivation. Where vegetation is allowed to grow around the trees it is necessary to begin irrigation earlier in the spring and apply it more often. Do not allow the surface of the ground to become dry and bake around the trees during blooming time. After irrigating the soil should be thoroughly cultivated or hoed so as to form a fine soil mulch four to six inches in depth.

We know of nothing better than dry sulphur for mildew. Apply it early in the morning while the dew is still on the plants.—W. R. W.

### Feeding Heifer

We have a seven months' old heifer that has up to the present time been kept in a pasture and fed on milk twice a day. Now the pasture is getting poor and the milk supply is decreasing. I would like to get your advice as to how to feed her economically. Would you give her nothing but hay, or would you advise a ration of both hay and grain? What kind of hay and grain would you use? How much of each?—Subscriber, Santa Cruz.

Your letter contains a point of argument in the word "economically." Long experience in the dairy business has taught us that stinting a calf is the poorest kind of economy and that a calf well raised—grade or pure bred—will return all you spend on it many times over when she comes into milk. In this case we would prepare a mixture of 100 pounds ground oats, 100 pounds bran, 100 pounds dry beet pulp, 50 pounds linseed meal and 3½ pounds coarse salt. Feed ½ pound of the grain mixture morning and night for each 100 pounds she weighs. At the same time give as much oat hay as she will clean up. At noon a small feed of good alfalfa will not be amiss. Continue the milk and pasture as long as they hold out as a supplement to the grain ration. After she is a year old, if well grown, pasture or hay will be all she needs until near calving time.

### Blight or Tip-burn

The leaf stems on my potatoes die or are eaten off next to the main stalk. I can find nothing that indicates they are eaten as the stem remains fast to the stalk.—Subscriber, Cohasset.

Without more detailed information we can but surmise the cause of your trouble. If the weather has been cool, especially if cloudy or damp, the cause may have been blight, and the remedy, Bordeaux mixture. If there had recently been two or three very hot days, it is perhaps a case of tip-burn for which there is no remedy, the trouble being entirely due to weather conditions and not unusual in June.

### Too Much Water

I am enclosing two peach leaves from a strong growing young tree planted in 1921. All the leaves are turning yellow like the enclosed and dropping fast and I fear all will go. The tree is large for its age, was given a spray of Bordeaux and lime-sulphur when dormant and has no leaf curl. The trouble started with the leaves about first of June. Have I given tree too much water?—Subscriber, Orange.

If you have watered heavily that is no doubt the cause of trouble, especially if you have also fertilized the tree. Relief could be afforded so small a tree by digging a hole at one side, but directed under the tree, at a depth sufficient to get below roots. Spading the surface deeply and leaving soil rough will also aid in drying out.

### Thorns on Palms

I would like to know what good the thorns are on date palms?—Subscriber, Indio.

Date palms are native to desert countries where at times there is no other green succulent vegetation. If plants had no thorns few would escape being eaten. As it is young plants have the tips of leaves chewed off, for the thorns occur only at base of leaves. Young cactus are tender and palatable and even when heavily spined are eaten by hungry animals. Spines are always nature's protectors. In the American tropics one palm, the spinyest (Acanthorhiza), has no spines on plant except on base of trunk, where they are thick, very long, and all point downward. No animal could climb one, and it is evidently a natural provision to protect the seeds from monkeys and other animals.

### Drainage Needed

What will sweeten soil that water stands on until May? It is soft in spots nearly the year round although these spots are higher than and but a few feet away from the drainage ditch. The water does not seem to seep through. Would tiling help these spots?—Subscriber, Lakeport.

Certainly tiling will help, and may be necessary, but one must determine if the use of the soil will warrant the expense—the crop may not be worth tiling. As you speak of "sweetening the soil" it is presumed it is sour or acid. If this be so plow deeply and apply lime when dry on top and then plow deeply again. If soil is not acid, but alkaline, use gypsum instead of lime.

### Sow Bugs or Damp Lice

Our garden is full of sow bugs and no plants do well. Soil is adobe. Do the bugs have anything to do with condition of soil?—Subscriber, Los Angeles.

The sow bugs have nothing to do with condition of soil but prefer acid soil and damp places where decaying vegetable matter is present. Apply 100 pounds or more of air slaked or hydrated lime to the soil. Scatter lime on top and rake well to mix with soil. It will not then cake when wet as it will if not first mixed with soil. This will "liven" your soil, make it easier to work, set free locked-up or unavailable plant food and much discourage multiplication of the insects.

### Weeds in Reservoir

How can I get rid of moss in a reservoir without rendering the water unfit for irrigation?—Subscriber, Shafter.

Copper sulphate is the best agent, and Dr. Wilson, bacteriologist for the Los Angeles water department, says about one and one-fourth pounds to 100,000 gallons should be about right, though the effectiveness of the dosage varies with the kind of plants in the water (all moss and scum is plant life). He further says stock are not injured by the water in which dosage necessary to kill plants is used. In the case of the city's drinking water, in the large reservoirs, two and seven-

or Mr. James Stewart, La Habra, California.

tenths pounds of copper sulphate to each acre-foot is used once a month.

### Dividing Rhubarb

What is the proper method to use in dividing roots of rhubarb to get new roots for planting?—Subscriber, Paradise.

It is only necessary to divide rhubarb into strong pieces. A leading rhubarb specialist lately visited pointed out rows of strong growing plants, saying "That new and rare stock I cut up to single eyes." It was vigorous.

### Cane Borers

How may I successfully combat the cane borer which attacks young shoots of loganberry in the spring? Have tried culling them back but that causes them to put out laterals. Will they bear as well on the short canes as on the long ones?—Subscriber, Paradise.

Culling out and burning canes is good, and with hand picking is the only means of control, generally found sufficient. Better send specimens of the borers to State Insectary, Sacramento, for determination; there are many kinds of borers and some may be reached by other methods. Good crops are sometimes grown on short canes by pinching the ends of the numerous laterals when they are about a foot long.

### Feeding Bees

How and what should be fed hives of bees which did not succeed in gathering sufficient stores for winter supply?

This query was referred to Henry Perkins who answers:

"The best and safest feed for bees at all times is sugar syrup. This may be made by mixing sugar and water, equal parts by measurements. It may be mixed cool and fed at once. An inside feeder should be used when feeding for winter stores. There are several different kinds on the market. A homemade feeder may be utilized from empty fruit cans or other vessels that will go inside an empty super placed on the hive. A whiff of excelsior or similar material should be placed in the vessel to prevent the bees from drowning."

### Strawberries Dying

Strawberry growers in the Eel Rock section of Humboldt County report that ten per cent of the plants died last year and probably 30 per cent this year. They appear all right one day and wilt and die the next. Can you advise us how this can be prevented?—Subscriber, Eel Rock.

County Agent J. W. Logan at Eureka writes: "I have had no inquiries regarding this matter and have not been in the Eel Rock section this year. I am unable to advise you relative to the condition or control. If the parties concerned would send some specimens and history of the plants to your office or to this office I am sure we could give them some assistance and if conditions warrant I would be very glad to make a personal visit to this section in order to assist them in their troubles."

County Agent C. S. Myszka at Ukiah, Mendocino County, writes: "In the Ukiah district where strawberries are grown on wet, heavy bottom soils the growers experience considerable loss in their plants. The trouble here is the result of a root rot caused by fungus. Fusarium wilt and rhizoctonia take hold in water logged soils, attacking the root and bark, thus hastening decay. The roots in many cases turn black, extending to the surface of the soil. The upper portion of the root system remains healthy and of good color, the lower portion blackened, gradually decaying and breaking off. We find that plants grown on soils of a porous texture are not affected. We imagine from what you say that possibly the Humboldt growers may be experiencing the same trouble found in this territory."

### CLASSIFIES ALFALFA ACREAGE

The agronomist for the Hairy Peruvian Alfalfa Association, J. W. Longstreth, has completed classification of alfalfa fields in the Yuma and Bard Valleys. The total acreage of alfalfa in the two valleys is approximately 22,194 divided as follows: Hairy Peruvian 16,875; Smooth Peruvian 1,839; common 2,315; mixed and unclassified 1,383.

This work has been in progress for the past three months and requires considerable experience. Mr. Longstreth has been identified with classification and certification of Hairy Peruvian alfalfa from the time when he first came to the Yuma Valley as county agricultural agent some years ago. Much credit is due him for the thorough manner in which he inspected and mapped the fields. Each one, large and small, is shown in its exact location together with its classification.

### STAKING CHRYSANTHEMUMS

Not many home gardeners stake 'mums and probably none closely approach the sufficient system adopted by the professional grower. This is what he does:

Insert a stout post at each end of the row and thoroughly brace. Between these posts and along the row of plants stretch strong light wires; the first, one foot above the ground, and others to the number of four, one foot apart above the first, At every five feet between the end posts drive a one by two inch by six foot stake and staple the wires to it at the point they cross. This wire and wood framework should be five feet high; the end posts seven feet long, with two feet buried in the ground to sustain the tension of the wire. With the intermediate posts one foot in the ground is sufficient. As the plants grow during the season, carefully tie them with raffia to the wires.

### WATERING CHRYSANTHEMUMS

Water is really the key to success in growing large 'mums If the plants are allowed to dry at the root the stems become hardened and no amount of water thereafter can soften the tissue. Good care subsequently will bring good flowers but they will never attain the size that is possible with soft succulent stems with large free sap channels or continuous cells. Professional growers usually flood beds or plants by the basin system. In warm weather vigorous plants can hardly receive too much water.

### CONTROLLING APRICOT BROWN ROT

Apricots in 1921 made up approximately 13½ per cent of all fruit canned in California. Because of loss due to brown rot growers should find the results of recent experiments carried on by the University of California college of agriculture exceedingly timely and helpful in maintaining a high rank of this California fruit. To control brown rot, spray the trees in the spring when about 1-5 of the blooms are open, using Bordeaux mixture in the proportion of 7½ pounds copper sulphate (blue stone), 8 pounds lime to 50 gallons of water. If the orchard is badly diseased a second spraying should follow a little later. As far as possible remove and burn all diseased branches and mummied fruit. Keep the center of the trees open to facilitate spraying, and admit sunlight to all the twigs and spurs.

### THIN THEIR SOUP

Dr. Hopkins says in "Soil Fertility and Permanent Agriculture": "Any treatment which hastens the normal growth of the plant usually helps the plant to resist or overcome the attack of insects or disease; and it is apparently true that imperfect or abnormal plants are more likely to suffer from such attacks than normal, healthy plants. It has been suggested that sucking insects prefer the concentrated sap of weak or somewhat withered plants to that of vigorous succulent plants. Doctor Forbes has suggested that the very dilute juice of a rapidly growing plant may constitute a starvation diet for healthy insects; in other words, that the capacity of the insect for such juice is not sufficient to furnish it with the amount of nutrition necessary for maintenance and reproduction."

### BIG FLOWER SHOW

Flower lovers living in the vicinity of Los Angeles are advised to visit Exposition Park to see the latest and best in all lines of herbaceous flowering plants. The entire seven acres are given over to local nurserymen and florists for displaying their special lines of flowering plants and all in Southern California are in friendly competition. One man has been occupied for nearly a score of years in hybridizing and selecting California poppies (Eschscholtzia) and has 24 shades now in bloom, from white to deepest orange, to crimson to lavender. The display is free to all who come.

The total number of tractors in Greece is about 500, of which about half are of American make. Walking plows and disk plows, cultivators and planters were called for most. The farmers also purchased hay mowers and presses, threshers and tractors, as well as a large number of farm wagons. American goods were sold exclusively.

THE evidence still piles up to support our statements concerning the remarkable service quality of the Fisk Red-Top where the demands on the tire are greatest. Read this letter from Arizona:

COCHISE MOTOR COMPANY

Bisbee, Arizona March 14th, 1922

The Fisk Tire Co., Inc., Chicopee Falls, Mass.

Gentlemen: This morning a man of this district came in from his lease over Tombstone way, in a very rough section of the mountains, and purchased two more Red-Tops for his Ford. He remarked when he was leaving that the Red-Top tire was positively the only tire that was giving satisfaction in the mountains up over the Continental Divide.

Very truly yours, E. SIMMONS

*There's a Fisk Tire of extra value, in every size for car, truck or speed wagon.*

FISK RED-TOP CLINCHER TIRE

*Extra Ply of Fabric* *Extra Heavy Tread*

**Corn Harvester** cuts and piles on harvester or winrows. Man and horse cuts and shocks equal Corn Binder. Sold in every state. Only $25 with fodder tieing attachment. Testimonials and catalog FREE showing picture of Harvester. Process Harvester Co., Salina, Kansas.

## GOATS

**800 Angora Goats** priced for quick sale. C. E. Bryant, Three Rivers, California.

## PRINTED STATIONERY

**Printed Stationery**—200 Sheets Note Paper 6x7 inches; 100 envelopes 3⅝x6½ inches, with your name and address neatly printed in blue ink. Sent postpaid for $1.25. Regal Stationery Co., Box 1342 Station C, Los Angeles.

## FARMERS NEED RADIO SERVICE

At the Radio Telephone Conference recently held at Washington W. A. Wheeler of the U. S. department of agriculture said: "There is no single use of radio, except for marine and aerial purposes, that should take precedence over its utilization for the benefit of agriculture. There are more than 32,000,000 people on farms, comprising nearly one-third the total population of the United States. The radio is the only means of getting to them quickly at small cost the economic information necessary in the proper conduct of their business."

Mr. Wheeler outlined the department's method of broadcasting weather, crop and market reports from radio telegraphy and radiophone stations of the post office department. Daily market reports on the livestock, grain, cotton, hay, feed, fruit and vegetable markets are broadcast over virtually the entire United States, and farmers located almost anywhere can receive them either direct or with the assistance of amateur operators. A number of state bureaus of markets and agricultural colleges are also broadcasting both local and national market and crop reports by radio telegraphy and radiophone.

"When thousands of tons of food products are threatened with destruction by impending storms or floods ordinary methods of communicating warnings are too slow," Mr. Wheeler said. "Market news to be of greatest value should be received the same day. The prompt receipt of reports on the condition of crops is also of great importance. The radio is the only means of quickly communicating these various kinds of information to the farmer."

A rapid movement in the formation of "Farm Rad Clubs" composed of farm boys and girls interested in radio is taking place throughout the country. Armstrong Perry of the Boy Scouts of America stated that the members of the Scouts organization were ready to lend every assistance in the dissemination of government news.

### THIS MONTH IN THE ORNAMENTAL GARDEN IN NORTHERN CALIFORNIA

(Continued from Page 9.)

rooted are very pretty the tuberous types are now to be secured in a vast number of beautiful shades in pink, orange, salmon, scarlet, yellow and white. The large singles are very attractive but the camellia shaped doubles and the frilled which have been recently developed are well worth a place in every garden. For balcony boxes and hanging baskets the pendulous types are most valuable. They must be planted in good leaf soil, and a little peat and a little well rotted manure will help them to produce their best blooms. They last in flower practically until cut down by frost. Hence they are well worth any extra attention.

#### Seeds to Sow for Winter Flowers

Primulas of late are being used considerably for winter and spring flowering, and among the best are Primula Kewensis, a fine yellow; Primula malacoides in lavender shades, very free flowering; P. obconica in pink, red and white; and, of course, the Primula veris and polyanthus types in various shades even to blue. Seeds of these should be sown at once in boxes of fine soil in a warm situation. Towards the end of the month sow viola, pansy, myosotis, wallflower, calendula, antirrhinum, English daisy, arabis, aubretia, alyssum saxatile and cineraria which may be grown in blue or pink shades, dwarf or tall mixed.

#### Chrysanthemums

These will need rich soil or frequent applications of liquid manure, and where the clumps have become too large they must be subdivided and replanted as they are really our best fall flower, especially the single and pom-pom types which make the hardy flower border attractive if grouped in the separate colors. The groups should be planted informally and the plants placed 10 to 12 inches apart. The young plants must be carefully watched for aphis and if attacked spray with black leaf 40.

---

One hundred sixty varieties of iris were shown at the iris society show in St. Paul June 1 and 2.

### CALCIPHILE AND CALCIFUGE VEGETATION

(Continued from Page 15.)

Onion, (Allium capa). Leaves. 3.63; Bulb. 1.21.

Rhubarb, (Rheum rhaponticum). Leaves. 0.32; Stalks. 1.45.

Radish, (Raplanus sativus). Leaves. 4.30; Root. 1.38.

Spinach, (Spinacia oleracea). Top. 1.96.

Strawberry, (Fragaria chiloensis). Vines. 1.22; Fruit. 0.07.

WEEDS

Sheep sorrel. (Rumex acetosella). Whole plant. 1.63.

TREES

Chestnut Leaves. 2.25.
Mulberry. Leaves. 5.14.
Oak. Leaves. 0.91.
Pine. Needles. 0.52.

---

### SAN DIEGO HAS NEW COMMISSIONER

R. R. McLean has been appointed horticultural commissioner of San Diego County, taking up the work of the office, July 1. Mr. McLean is well known to Cultivator readers through his articles dealing with San Diego County's agriculture. He has been for sometime in charge of the farm service department of the First National Bank of San Diego and in that position has had opportunity to thoroughly acquaint himself with farming conditions.

---

### SAVE THE YUCCAS

He who filches a flowering yucca stalk takes that which not enriches him and makes the landscape poorer. If left until it matures the stalk provides an object of beauty that may gladden many hearts, and as the parent dies through this supreme sacrifice, several young plants are thrust out from the mother plant ere her vigor begins to wane, and thus is vegetative reproduction assured. Aside from this a small per cent of the seeds will germinate, yielding an additional crop of young plants. We have not yet learned of anyone who has observed the subsequent behavior of a denuded plant; does it die without reproduction? The shock is great, for the floral effort results from the accumulated vigor of years and the daily flow of sap into the flower stalk is heavy.

---

### WILD FLOWERS IN SEQUOIA

A trip to Giant Forest in the Sequoia national park means an unusual opportunity to widen one's acquaintance with the wild flowers of California. Along this road wild flowers in full bloom make a riot of gorgeous coloring. Many of the flowers are unfamiliar to the average Californian. The predominating species which may be observed now are: Blue lupine, white lupine, Indian pink, bleeding heart, yucca, bladder-nut, syringa, Fremontia, dogwood, bush poppy, wall flower, monkey flower, yerba santa, mountain lilac, sulphur flower, satin bell, twining brodiaea, morning glory, yellow violet, buckeye, godetia, Mariposa lily.

Some of these are noted for their vast territorial and altitudinal range, while others are limited to a very small area not extending beyond the boundaries of California. Visitors should inquire at ranger stations about regulations governing flower picking. In general the regulations limit picking to three specimens of the more common varieties for each visitor, and these must not be taken in the immediate vicinity of Giant Forest, campsites, roads or trails. Wholesale or careless picking of flowers or damage to shrubs and trees will be prosecuted.

---

### CALIFORNIA COOPERATIVE CANNERIES IN SAN FRANCISCO

Publicity Manager R. C. Spencer of the California Cooperative Canneries writes that headquarters have been moved from San Jose to 503 Market Street, San Francisco. The association has canneries at San Jose, Modesto, Visalia and Tulare.

### HOW TO FIGHT ARMYWORMS

Armyworms are reported from Tuolumne, El Dorado, Fresno, Amador and San Luis Obispo Counties. The armyworms are largely hatching on uncultivated areas or on orchards in which weeds have been allowed to grow, says T. D. Urbahns, entomologist. The armyworms travel rapidly and destroy cultivated crops and young trees in their path. Investigation of outbreaks and specimens sent to the state insectary show that several species are involved in this destructive work.

The bureau of pest control of the state department of agriculture is recommending several control methods. The particular control methods selected for any locality must be chosen to meet the requirements for local conditions. Spraying the crops with arsenate of lead solution, spreading poison bran mash prepared according to the formula recommended for grasshopper control, dragging the soil where armyworms are traveling with specially prepared brush drags, and plowing furows in which the worms may collect and in which they may be destroyed by dragging a log through the furrow at the proper intervals are methods that may be used to good advantage. Armyworms are comparatively easily destroyed when the outbreaks first occur but if the worms are allowed to spread over the fields the damage may result in the very severe destruction of crops and trees.

# Lice Kill Chickens in Warm Weather

**Summer Months Most Dangerous, Says Poultry Authority—To Prevent Losses Add Minerals to the Fowls' Drinking Water**

If your chickens are sickly, won't lay and are dying off in hot weather, lice and mites are probably the cause. Dr. B. F. Kaupp, famous poultry authority, says: "Lice are most common in July and August. During these months conditions are more favorable for their propagation." To easily get rid of these pests and prevent losses, add minerals to the fowls' drinking water. This does away with greasing, dusting, spraying and dipping. Soon after the fowls drink the mineralized water all lice and mites leave them.

The necessary minerals can now be obtained in convenient tablets, known as Paratabs. They are scientifically prepared, perfectly safe, and dissolve readily. The tablets also act as a tonic conditioner and are warranted to impart no odor or flavor to eggs or meat. They are equally beneficial to young chicks and grown fowls. The health of the fowls improves, they grow faster, stand hot weather better, and the egg yield frequently is doubled. Mrs. M. N., Pulaski, Ky., says: "I am giving Paratab water to my chickens and am having better luck this year than ever before."

Any reader of this paper may try Paratabs without risk. They cost only a trifle and are sold under an absolute guarantee. Furthermore, the laboratories producing Paratabs are so confident of good results that to introduce them, they offer two big $1 packages for only $1. Send no money, just your name and address to the Paratab Laboratories, Dept. 959, 1100 Coca Cola Bldg., Kansas City, Mo., and the two $1 packages, enough for 100 gallons of water, will be mailed. On delivery pay the postman only $1 and postage. If not delighted with the results in 10 days, notify the laboratories and your money will be refunded in full. Don't hesitate to accept this test offer, as it is fully guaranteed.

## Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. Careful attention to every order, large or small. Send today for prices.

# Napa Delegates Enjoy Poultry Tour

By Melvin W. Buster, Assistant County Agent, Sonoma County

APPROXIMATELY 160 people from Napa County enjoyed poultry tour arranged by the Sonoma County farm bureau. The first stop was made at the Petaluma packing plant of the Poultry Producers of Central California, where they were addressed by Farm Adviser Weinland; D. B. Walls and H. W. Kerrigan and C. E. House gave talks.

The delegation was then divided into three groups and visited the Sales Hatchery, Pioneer Hatchery, and the plant of the Must Hatch Incubator Company, where they were told something of the problems and advantages of commercial hatching.

They next visited the Avian Pathology Laboratory at Petaluma, conducted by the University of California, where they were told something of the work the university is doing to control poultry diseases, by Dr. J. C. Corl, who is in charge of the laboratory.

They were then taken to the Sonoma County Farm Bureau Egg Laying Contest where F. P. Eckland, the contest manager, spoke on the "Establishment and Growth of the Contest and Its Value to the Poultry Industry."

The next stop was made at the poultry ranch of George E. Burlingame near Sebastopol. Here the delegates were given the results of brooding projects conducted by Mr. Burlingame to test out three different methods of feeding baby chicks. They were also given the results of pullet selection tests made by the agricultural extension service cooperating with Mr. Burlingame, and the results of the entire county projects of pullet selection were also explained, as well as the records on hen culling tests made on five poultry farms.

The next stop was made at the Analy union high school, where the delegation was given a lunch by the Sebastopol chamber of commerce and the Cunningham farm center.

The next place visited was the poultry breeding plant of Ernest Williams of Sebastopol. Here D. B. Walls gave a very interesting discussion on the projects of the poultry department of the farm bureau which are being conducted to improve the quality of the stock in Sonoma County. The projects mentioned were: The egg laying contest, the pure bred pedigreed Cockerel auction sale, the accredited hatchery plan, and the poultry registry association. Mr. Williams also spoke to the delegates on the factors involved in establishing and conducting a poultry breeding plant.

The last stop was at the commercial poultry plant of T. D. Taylor, about four miles northwest of Sebastopol. Mr. Taylor, since starting in the poultry business two years ago has had very good success as the careful records which he has kept on his flocks indicated. In 1920-21 he made a net profit of $1.52 per hen above all costs of feed, labor, depreciation on stock and buildings, interest on capital invested, etc. Also for the past eight months he has already made a net profit of $1.11 per hen. Mr. Taylor has the university type poultry laying house and feeds the ration that is being fed at the Sonoma County egg laying contest, which includes the use of dry mash only. These records were also made without the use of electric lights. The average production made from the 200 hen flock the first year was 188 eggs per hen and the eight month record on the flock which he has this year which numbers 800, already averages 124 eggs per hen. The delegates were very much interested in the figures on this plant and asked a great many questions of Mr. Taylor.

# Poultry Queries

Conducted by Jean A. Koethen

### Hoganizing

In some of my three months old pullets the space between the pelvic bones is only half a finger and between the pelvic and the breast bone, two fingers. Should these pullets be sold or will they develop into layers? I have Reds and Whites mixed in breeding; has that anything to do with their build? I have read Hogan's book and did not learn much from it. Is there any way of learning sure and reliable culling, a course of instruction or a book?—Subscriber, Los Angeles.

The value of Walter Hogan's book is in the principle it enunciates rather than in the rules it lays down. There was a time when many expert poultrymen felt they could depend on distance from pelvic bone to keel as a sure and reliable indication of the value of the pullet, but experience has proved they were mistaken. The trapnest is the only certain way of finding out whether a hen is a good layer or not. I have no confidence in these tests as applied to pullets. Vigor is the only test for them. For hens that have laid a year or more the condition of the pelvic bones and abdomen, appearance of comb, color of shanks and earlobes are a very fair guide to her value for another year's laying. The distance apart of the pelvic bones shows little more than whether she is laying or not at the time of examination. These bones are always close together in a hen that is not laying, and in the spring when every hen ought to be laying their position is a pretty sure test of her productiveness. During the molting season and before laying begins not much dependence can be placed on them. The best way to learn how to cull is to cull. Attend some of the culling demonstrations which are being given in the various centers by extension poultrymen and get the principles of culling firmly fixed in your mind. Then go home and cull your own flock, putting the culled out hens in a pen by themselves and feeding them as you do the rest. You can tell in a week or so how sucessful your work has been. Crossing breeds as unlike as R. I. Reds and White Leghorns can certainly do no good and destroys the results of years of breeding. Better stick to pure breds. (We hope this inquirer noticed announcement of poultry culling demonstrations in Los Angeles County last week. Schedule was given on page 697 of the Cultivator.)

### Weeks House

I am just starting the chicken game and am building Charles Weeks houses with dirt floors. Which is best to cover the ground with, beach sand or pit sand? I can get the beach sand cheaper.—Subscriber, Gardena

Those who use these houses use the coarsest sand obtainable, or fine gravel when it is to be had. I do not know that there is any objection to beach sand, but coarser material is better for the hens' digestion and makes a more substantial floor covering.

### Rhodes Grass

What is the best season for planting Rhodes grass, and what is its value as greens for chickens?—Subscriber, Artesia.

Rhodes grass is planted in April and May. I have not heard of its use as chicken greens. Will some one who has tried it tell us how it compares with kale and other substitutes for alfalfa?

### Intestinal Disturbance

Some of my ten weeks old R. I. Red pullets lie on the ground with outstretched legs as if dead, all very dopy and unable to stand. I give castor oil and put them in a box alone. After a little they jump up and flap around as if in convulsions, crying like a young turkey. In 24 hours one had apparently recovered; the rest have been sick only a few hours. I feed Surelay with 50 per cent bran added, greens and commercial scratch.—Subscriber, Fresno.

The symptoms are those of severe intestinal disturbance, probably from poisoning. As you say the pullets are on range, they may have gotten hold of a dead gopher or some spray or other poison used on trees or vines. I have seen chickens act that way when they had eaten meat doped with strychnine for stray cats, only they did not recover. Sometimes intestinal worms produce paralysis in young birds, but the poison theory seems more probable. Castor oil, when you do not know the cause of such sudden illness, is the best treatment. If you knew just how they had been poisoned the proper antidote should be administered. Better shut up the flock for a few days till you find out where the trouble is.

### Culling

Can you tell me what charge is generally made for culling chickens in a flock of 600? When is the best time for this, and is there any one you can recommend?—Subscriber, Tejunga.

I referred this question to your county farm adviser, and he says that while there have been men who were brave enough to cull other flocks than their own the results of their work have not been satisfactory. The best time for culling is from now on. Cull out every hen that stops laying before July 1, for whatever reason. Band the hens that go broody in July and August, and if they go broody more than once put them with the culls. Cull out also every hen that starts molting before September and every hen that is out of condition. Do not dispose of these culls immediately but try them out for a time and see what they do. The molting test is the most certain of all, for there seems no question that late molters are the best layers. What we want is "long distance" layers, that is, layers that will lay a year or more without stopping. Leghorns that go broody more than once and heavy hens that go broody frequently lose too much time to be

### POULTRYMAN'S CALENDAR—JULY, STOCK TAKING TIME

The merchant does his culling in June, gets rid of goods that are not worth carrying over and on the first of July takes account of stock to find out just where he stands. If the merchant does this, is it less important for the poultryman? Young stock is nearly grown, pullets almost ready for the laying house, cockerels marketed, or, if they are late, nearly ready for caponizing. Old hens are being culled out as fast as they begin molting, and those which were obviously unprofitable have been eliminated. Now is the time for the poultryman to sit down and think over what he is going to do next year. Has he all the pullets he needs? If not, he may wish to plan for September hatching. Has he more than he can house properly? Now is the time to find a buyer for them? Now is also a good time for a general housecleaning. Laying houses should be perfectly clean for the incoming pullets; brooders cleaned and put away; fences repaired; yards spaded; houses and fences painted. The new year's work begins in August. Now is the time to close up the old year's accounts.

profitable. If possible attend one of the culling demonstrations given by the extension poultrymen and get the principles by which he culls firmly fixed in your mind, but I believe you will find the molting test the most reliable of all. (See also answer to "Hoganizing". We have mailed both inquirers schedule of culling demonstrations in this week's Cultivator.)

### Laying-Brooder House

I would like plans of a good open front house that can be used for brooding young chicks with reliable hover.—Subscriber, Willows.

Any good laying house may be used for a brooder house. If the front is entirely open, cover it with muslin or tarred paper, preferably muslin because it lets in light and air. If the front is boarded up two-thirds of the way and open only the upper one-third a curtain over the upper one-third is all that is needed. If the house is built with nests and hoppers along the front you have only to cover the openings, wherever they are, so that the heat will not escape. Small doors may be made to let the chicks out into the sun and temporary runways built of fine wire. The best way is to build the kind of laying house you like best and then make it do for a brooder house. Heat, fresh air and exercise are the three essentials in chick raising, and these can be provided in any kind of house. An article describing such a house appeared with illustrations in the Cultivator of April 1. Copy has been mailed to this inquirer.

## CALIFORNIA FARM BUREAU EGG LAYING CONTEST

For the eighth month (May) of the California Farm Bureau Egg Laying contest at Santa Cruz the average production of the 620 contesting hens was 65.8 per cent, or an average egg production from each hen of 20.4 eggs in the 31 day period.

The feed consumption this month amounted to 3.42 pounds grain costing 6.49 cents @ $1.90 per 100 and 4.2 pounds mash, costing $10.92 cents @ $2.60 per 100 pounds. The total cost per hen for the grain and mash eaten in May was 17.41 cents. The consumption of mash increased somewhat over the 50 per cent mark due to increased production. The same was true in April.

# Bulk Handling of Grain a Success

By W. W. Mackie, Agronomy Division, University of California

FOR many years preceding the war bulk handling of grain was practiced. The Sperry Flour Company has elevators at Vallejo equipped to handle 6000 bushels of wheat. At its Stockton mills wheat and other cereals are handled in bulk at a great saving in cost, time and grain. All flour mills which handle imported wheat must handle it in bulk for it is in this condition that the hard wheats of Kansas and other Eastern points are imported into California to be mixed with our softer wheats at the mill. Not only are grain elevators now established at the mills, but scattered over California are several elevators which were in successful operation even before the terminal elevators were erected. Successful experiences with elevators in Hamilton City, Glenn County; Athlone, Merced County; Corcoran, Kings County; Murrietta, Riverside County, and Wasco, Kern County, indicate how widespread is the movement for bulk handling in California.

Under the impulse given bulk handling by the renting of the large and efficient grain elevator by the California Farm Bureau the whole system of bulk handling of grain in California has been placed on a permanent basis.

### Objections to Bulk Handling

The objections to changing from the old method of sack handling to the bulk handling may be almost wholly included under the head of "cost in making the change." The farmer objects to the change because he must add a bin to his combined harvester and must prepare a bin or bed on wagon to haul away the grain as fast as it is threshed. When the loose grain is hauled from the field it must be loaded directly into cars or into a temporary small farm bin made of metal, concrete or wood. These bins may, of course, be readily equipped with grain pits and small engine elevators which fill them automatically. If the bins are situated on the railroad the grain may be loaded directly into cars as the grain is delivered from the field. The cost of this equipment is not great and those who have used these methods agree that it is usually saved by the economy of bulk handling over sack handling in one or two seasons. One of the greatest difficulties encountered is the renter who cannot afford to make costly changes or place equipment on a farm which he does not own. To meet this condition a fair solution would be for the ranch owner to furnish the permanent warehouse or bin equipment while the tenant, if he furnish the harvesting machine should provide the harvester bins and wagons for bulk hauling.

### Substantial Savings

The experiences of several practical farmers who have tried both sack and bulk handling with combined harvesters all agree that 25 to 35 per cent of the cost of the sack method is saved by the bulk method of handling grain, with greater ease in operation both to the men employed and to the manager of the ranch. The harvester with self binders does not give the saving, but here too a saving of 20 to 35 per cent is shown by bulk handling. The headed grain likewise gives a similar saving. The latter methods must prevail in certain portions of the state where fogs prevent the use of combine or where irrigated areas are cut into small fields and where weeds in harvested grain require drying before the straw is threshed. The greatest savings are made in the expense for sacks, the waste in leakage and spillage entailed by the use of sacks, and the saving in the number of men required by the old sack method.

### The Present Day Method

The present acreage of wheat, barley and oats (3,000,000 acres) will not be greatly reduced and will provide not less than 45,000,000 bushels of grain annually. All of the wheat will go to the flour mills within the state where it may be handled in bulk. Of the barley crop about 22,000,000 bushels or more will be exported annually and would therefore be handled to advantage in bulk. To this quantity of grain to be handled by elevators may be added 50 per cent of the wheat consumed in the state as flour. This quantity of grain should offer a substantial basis for establishing a permanent system of elevators for bulk handling of grain in California.

Shipping grain in box cars in bulk is common practice in other states, and most cars are provided with doors for bulk shipments. If the shipper must for any reason provide the boarding inside the door, he may be reimbursed for this expense according to a decision of the railroad commission.

Water transportation, which was once adverse to bulk handling, now offers no objections, for all modern freighters are provided with bulk heads to prevent the shifting of the cargo.

There appears no insurmountable difficulty to prevent California from joining the rest of the United States in handling grains in bulk.

## PROTECT LEATHER GOODS

Preparations to prevent the growth of mildew on leather are not usually to be recommended, says the bureau of chemistry of the United States department of agriculture, because only highly poisonous materials are effective, and they are dangerous. Leather articles such as harness, shoes, suitcases, and bookbindings, are almost certain to mildew if kept in a warm, damp and dark place. This means that particular care should be taken of leather articles during the spring and summer. Mold will not seriously damage leather unless it remains too long, but it will change the color and in that way do considerable damage to some articles.

The simplest way to keep leather from mildewing is to keep it in a well-ventilated, dry, well lighted place, preferably one exposed to sunlight, a cheap and effective disinfectant. Molds make little growth in sunshine.

When mildew has developed it should be wiped off with a damp cloth or washed off with soap and warm water, and the leather oiled lightly with castor or neat's foot oil and well dried afterwards. These simple methods for preventing and removing mold are satisfactory and safe.

## TRACTOR TIPS

If you would be safe rather than sorry, don't overload.

To run a straight furrow you must look a long way ahead.

Read, study and commit to memory the book of instructions.

Carelessness and abuse are at the bottom of most tractor troubles.

Don't play with your tractor. Be serious. Make power farming a business.

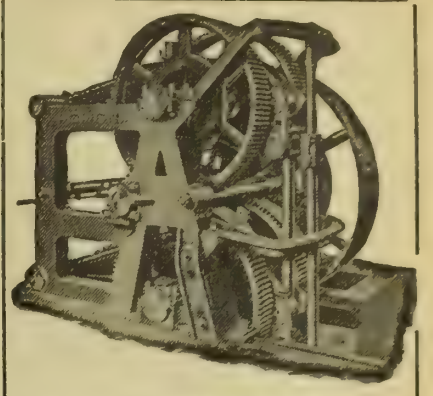
Planning your work so that it can be done with the least possible effort is not laziness but good planning.

Cantaloupe production in Southern California, Florida, and Texas has a prospect of 16,862 cars of 350 crates each in the forecast made by the department of agriculture, and this is a gain of 39 per cent over the harvest of 12,090 cars in 1921. Nearly all of these cantaloupes are produced in Southern California where the forecast crop is 16,241 cars, leaving 357 cars to Texas and 264 cars to Florida. Production, expressed in carlots, usually exceeds the carlot movement.

## "SURE THING INVESTMENTS"

Dockets of the federal courts throughout the country are swamped with fake stock swindling cases in which more than $140,000,000 has been taken from incautious investors. Most of the schemes offer fake oil stock. R. J. Bischoff, recently brought to time in Chicago courts, has stolen more than $7,000,000 from credulous "investors" in his fake schemes. All this within two years.

Says Sam: Some fellows can see more on a Sunday afternoon tramp through the woods than others can see on a tour of Europe.



THE POMONA

Duplex Plunger Deep Well Pumps

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

### LIVESTOCK

Los Angeles, June 27.—Weighed and delivered off cars without food or water.

Hogs (hard grain fed), 125 to 175 lbs., 10.75; 175 to 225 lbs., 11.00.

Cattle (on foot, gross weights): Steers, good, 5.00; bulls and stags, 9.25; calves, 125 to 150 lbs., 10.25; 150 to 225 lbs., 8.50.

Sheep: Ewes, 5.00@6.00; lambs, 11.00@12.00.

### POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, June 27, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Movement slow, market steady. Idahos, Russets, 3.00@3.50; bakers, 4.50 cwt. Stocktons: Ordinary, 200@2.50. New Stock: Best, locals, 70@80 per lug; small, 60@65.

Sweet Potatoes: Movement light, market steady. Arkansas: Nancy Halls, per bu., mostly 1.50@1.75.

Onions: Demand moderate, market steady. Quality fair. Coachella and Imperial Valleys, crates, No. 1, Whites, 1.75; yellow, 1.50. Stocktons: Reds, 1.60@1.65; yellows, 1.75@1.85.

### VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, June 27, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Asparagus: Per lb.: Northern, 10@12.

Beans: Market dull. San Pedro Wax, 5@6; Ky. Wonder, 4@6.

Bunched Vegetables: Per doz. bunches: Turnips, 40@45; beets, 35@40; carrots, 40; radishes, parsley and spinach, 15.

Cabbage: Market steady, quality ordinary. Field cr., best mostly 2.25@2.50.

Cucumbers: Local, 60@65 per cr. 28-36's; lug, 1.15@1.25.

Celery: Movement moderate, market steady. Wide range in quality and prices; quality, generally ordinary. Locals, best, 6.50@6.75; poorer, 6.00@6.25.

Corn: Green, Imp., best, 35@50.

Eggplant: 16@20 lb. Coachella.

Lettuce: Market steady. Locals: 1.00@1.15 per cr.

Okra: Lb., best, small, 8@9; poorer, large, 5@6.

Peas: Best Northern, lb., mostly 6@7½.

Peppers: Demand moderate, market firm. Bell, local, 22@25; chili, 14@15.

1.00; mostly, 75@85.

Rhubarb: Local, best, Crimson, 75@mer, lugs, 75; Italian, lugs, 90@1.00.

Squash: Market steady. Locals: Summer, lugs, 75@90. Italian, lugs, 90@1.00;

Tomatoes: 4-basket crates, Imperial Valley, mostly 1.60@1.75; Coachella Valley, mostly 1.85@2.00; San Pedro, lugs, 3.50@3.75; Texas, crates, 2.35.

### FRESH FRUIT

These are actual prices obtained June 27 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc., as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apples: New Astrachan, per lb., 10.

Apricots: Lb., Northern Tilton, best, large, 7; Royal, small, 3@5.

Blackberries: Cr., 2.50@2.75.

Cantaloupes: Imperial Valley: Standards, best, 1.75@2.00; poorer, 1.25@1.50; ponys, 1.50@1.65; flats, 65@85.

Cherries: Per lb. Black Tartarians, best, 13@15; soft, 10@12; Bings, 16@20; few 22. Black Republicans, 14@15; Royal Annes, 12@14; few, 16.

Currants: Cr., 2.50@3.00.

Figs: Northern, 27@32 lb.

Loganberries: 2.25@2.50 per cr.

Grapes: Coachella Valley. Thompson Seedless, 18@20 lb.

Peaches: Few fy., 11@12 lb.; mostly, 6@8.

Plums: Market oversupplied. Beautys mostly 3@5; overripe, no demand.

Raspberries: No. 1, 3.25@3.50.

Strawberries: No. 1, 4.50@4.75; No. 2, 3.50@4.00.

Watermelons: Imperials, Chilean, 2 per lb.; Klondike, 2½.

### CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock June 27 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 3.50@4.00; market pack, 3.00@3.50; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Locals: Loose boxes, best, 2.50@2.75; poorer, 2.25; special brands, fancy, 6.75@7.50; choice, 5.50@5.75.

Oranges: Demand moderate, market steady. Navels, culls, 1.50 per field box; Valencias, special brands, 7.75@8.75, according to size.

### HONEY

Beekeepers report that the orange flow is over, but that bees are still gathering sage honey. The yield of orange honey is reported as fair to good, that of sage and buckwheat as good. Both orange and sage new crop are said to be of fine quality. Few sales are reported in carlots F.O.B. Usual terms from California points of extracted: White orange blossom and sage at 9½@10; fancy high as 10½ per lb. Light amber alfalfa, no sales reported, but shippers quoting 6@6½ per lb.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 20.00@26.00 |
| Barley | 18.00@22.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@22.00 |
| No. 1 Alfalfa | 15.00@17.00 |
| Standard Alfalfa | 12.00@14.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 20.00 |
| No. 1 Dairy | 15.00 |
| No. 1 Alfalfa | 12.00 |

Beans: Ky. Wonder, 5@7 lb.; wax, 5@6; Italian, 12@13.

Beets: Sack, 1.00@2.00.

Bunched Vegetables: Carrots, 60@70 per dozen; turnips, 55@60 per dozen; beets, 50@60 dozen; parsley, 30; radishes, 30 per dozen bunches.

Cabbage: River, 2 per lb.

Cauliflower: Half-moon Bay, doz., 75@1.00.

Carrots: 1.50@2.50 sack.

Celery: So. Cal. 8.00.

Corn: New, doz., 25@75.

Cucumbers: Arizona and local, small, 25@50 per dozen or 1.25@1.50 per small crate; English, 1.75@2.00; Texas, box of 5 doz., 1.25@1.50.

Eggplant: Southern, 15@22 per lb.

Lettuce: Local, 75@1.00 cr.; iced, 1.25.

Parsnips: 3.00@3.25 per sack.

Peas: Bay, 1½@3 lb.; Half-moon, 3½.

Peppers: Florida and Mexico, Bells, 25@30; Chilis, 10@15.

Rhubarb: Box, 1.50@2.00.

Spinach: Lb., 3@4.

Squash: Summer, lug, 75@1.25; Italian, cr., 50@1.00.

Tomatoes: Imperial, best, 1.50@2.00 crate; Mississippi, 1.75@2.25 crate; Merced, 3.00 lug; 1.25@1.75 crate.

Turnips: 1.25@1.50 per sack.

### FRESH FRUIT

Apricots: Lb., 6@10; cr., 1.50@1.75.

Avocados: 10.00@15.00 per doz.

Apples: New crop, green, lug, 1.00@2.00; fancy, box, 1.75@2.00.

Bananas: Hawaiian and eastern, 7½@8 per lb.

Blackberries: Dr., 50@60.

Cantaloupes: Imperial Valley, best, standard crates, 2.25@2.75; Pony crates, 1.75@2.25; Flats, 85@1.00; few higher; Honey Dew, flats, 2.50.

Cherries: Black, 1.25@1.50 per box; bulk, black, 6@10 per lb.; white, 8@10; Royal Anne, 10@12½; Bings, 12@16.

Currants: Dr., 90@1.10.

Figs: Small box, 1.50@1.75.

Gooseberries: 10@15 lb.

Loganberries: Dr., 35@40.

Pineapples: 5.00@6.00 per doz.

Peaches: Basket, 1.25@1.50; cr., 1.25@1.75.

Cal. Pear Growers prices to canners ton: No. 1 Bartlett, 75; No. 2, $40.

Plums: 1.25@1.75 per cr.

Raspberries: 85@1.00 dr.

Strawberries: Watsonville and Salinas, cr., 1.20@1.60; local, 50@85 dr.

Watermelons: Florida and Imp., 2½@3.

### CITRUS

Grapefruit: Southern Cal., fancy, spec. pack, 4.50@5.50; choice, 3.00@4.00.

Lemons: Spec. pack, 6.00@6.75; choice, 5.00@5.50; Lemonettes, 2.00@3.50.

Oranges: Valencias, fancy boxes, 126s, 9.50; 150s, 8.50; 176s, 8.00; 200s and smaller, 6.00@7.50; choice, 5.50@8.50; Culls, 3.50@5.00.

California Rice Growers Assoc. report: No. 1 Paddy, 2.77.

### HAY AND FEEDSTUFF

A. W. Scott Co. reports under date June 24.

Receipts past week 1022 tons as compared with 554 previous week. The local market has been lower during the week. Strictly first class hay is in light supply and moving readily. Export and shipping have been more active. Country trading has been very light as every one is busy harvesting and the crop is not in condition to market as a general average. Alfalfa has been more quiet than for sometime. Many of the producers are still holding for prices higher than consumers are willing to pay. Some little talk of grasshopper scare through the Sacramento Valley has been noted but of no serious consequence as yet. Crops in the river and Bay sections are reported in A-1 condition.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling epxenses must be added according to conditions).

| | Ton |
|---|---|
| Wheat Hay, No. 1 | 16.00@18.00 |

An Attractive Section of California's Good Roads

## CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, June 26, 1922.

Chicago market last week showed slight decrease in receipts and increase of approximately 15 cents per hundred.

San Francisco market rather quiet. Additional sales have been reported at 6¾c to 7c f. o. b. ranch for prime steers, with approximately ¼c to ½c less for poorer grades; cows, 5½c f. o. b. ranch. Handy weight steers are bringing considerable premium over heavy weight, 1000 to 1100 pound steers preferred.

Los Angeles market shows slight improvement. Los Angeles buyers have paid 7c for steers and 5¾c for cows bought in San Benito County during the past week. Sales in Santa Barbara County are reported for ¼c less on both steers and cows. Sales have been reported from the Imperial Valley at 6¾c f. o. b. ranch for 8 cars of Arizona steers going to El Paso. Sales have also been made in the Imperial Valley and in Madera County for cattle going to Reno, Nevada, bringing 6½c f. o. b. ranch for steers which were rough and not prime.

The past week has probably marked the peak of shipments of early grass fat cattle to market and accounts for the large supply of cattle on hand in yards of packing plants, and for the large amount of dressed beef in coolers. This is the condition which normally exists about a month earlier, but is late this year because of late grass. It should not cause alarm on the part of the cattlemen, but on the other hand sales should not be pressed for the coming two weeks, after which time it can confidently be expected that a better market will exist.

General situation much improved over year ago. Last year at this time, California markets were being flooded with cattle from Oregon, Nevada, Utah, Arizona and Texas. During this month, California has shipped cattle to all of these points. While buyers are decreasing actual purchases during the past few days, they are showing considerable activity in locating cattle for future delivery. With numerous outside buyers in California, and no surplus of really fat cattle, we should confidently expect a good market in July and early August before the fall supply of fat cattle is ready.

Only half-fat cattle will break the market. Sell only prime, fat beef. Sell only f. o. b. ranch or shipping point. Report sales to your secretary.—R. M. Hagen, 814 Santa Fe Bldg.

## CHRISTIERSON RESIGNS

S. V. Christierson, standardization inspector of the state department of agriculture has resigned, effective July 1. Mr. Christierson has been with the department since its organization and among other duties has been in complete charge of all the apple inspection work during the last two years. He expects to enter the fruit and vegetable business, operating principally in apples, with headquarters at Watsonville.

## SALT TOLERANCE OF CITRUS

The response of citrus seedlings in water cultures to various salts, especially the more alkaline, has been the subject of much study of late. A series of experiments was carried out, mainly at Riverside, in connection with other investigations relating to the causes of the malnutrition of citrus plants. Lemon, grapefruit and several varieties of orange seedlings were grown in water cultures to which were added solutions of various salts or organic matter. Seedlings of various citrus stocks showed no characteristic differences in response to water cultures or in resistance to toxic solutions.

Very dilute extracts of organic matter from upland peat (10 parts per million or more) produced a marked stimulative effect on the root growth of citrus seedlings. Corresponding concentrations of sodium nitrate or potassium chloride did not stimulate the root development. Calcium carbonate stimulated the root growth and exerted a pronounced antagonistic action to toxic solutions of nitrates and ammonium sulphate. Peat extracts in very dilute concentration (20 parts per million), and calcium carbonate both protected citrus seedlings to a marked degree against the toxins of distilled water.

The tolerance of citrus seedlings to alkaline salts is relatively high. The toxic limit for calcium hydrate was 100 to 120 parts per million, for sodium hydrate 250 to 300 parts per million, and for sodium carbonate 550 to 600 parts per million. When soluble organic matter (which is acid in reaction and stimulating to citrus seedlings) in concentrations of 1000 parts per million or more, is added to a sodium carbonate solution of 400 parts per million, which in itself is toxic, a highly toxic solution is formed which kills the root tips of citrus seedlings. This reaction appears to be of practical importance in connection with the toxicity of soils containing small amounts of sodium carbonate.

## CITRUS CANKER

Citrus canker was so called because the genus citrus yields the most important commercial crop of any group in the great order of rutaceous plants. Citrus is only one genius in 20 or more that experiments have proven susceptible to the disease. It is suspected that other plants, not closely related, may be successfully inoculated, especially in Meliacea, the family to which the umbrella or China berry tree belongs.

Inoculation tests with Pseudomonas citri, the agent of citrus canker, carried out at Lamao and at Los Banos, Philippine Islands, as well as at Washington, D. C., upon 24 species representing 20 genera of the family Rutaceae, showed that 19 of these species were susceptible to citrus canker in a greater or less degree. It thus appears that this disease is not strictly limited to the genus citrus but has a wide range of hosts among the Rutaceae.

Fortunella Hindsii, a kumquat, occurs naturally in South China, very much isolated from sources of citrus canker infection. The abundance of cankers found on such trees gives rise to the theory that this species may have been an original wild host from which citrus canker spread to cultivated species.

## THE RIGHT WAY TO MIX BORDEAUX

Bordeaux mixture for diseases and insect enemies of potatoes, as recommended by the United States department of agriculture, is made up of 5 pounds of copper sulphate (blue vitriol) and 5 pounds of freshly burned lime in 50 gallons of water. The copper sulphate is dissolved and the lime slaked separately and then the two are mixed. Putting the two materials together in concentrated form at once materially affects the physical properties of the spraying mixture. Improper mixing also causes difficulties in spraying.

Copper sulphate dissolves best if put into a bag and suspended in water. In making the lime milk a little hot water should be poured on first until the lime becomes active and then cold water is added slowly as the lime slakes until a fairly thin white liquid results. In mixing the lime milk and the copper sulphate solution at least one of them should be fairly dilute. In making up the final mixture in small amounts the solution of copper sulphate should be poured into the lime milk. If the process is reversed a thick, heavy sediment is formed which will not pass readily through the spraying machine nozzle.

## SONORA DATES

According to Consul Bartley F. Yost, at Guaymas, Sonora, Mexico, the production of dates in Lower California is about 1,540,000 pounds, practically all of which is consumed in Sonora and Sinaloa, practically none of them reaching the United States. They are not shipped to the American market owing to the fact that they are not packed attractively and are hauled for many miles in bags made from hides or goat skins.

## COMING EVENTS

(Corrections and Additions Requested.)

**Coachella Valley Grape Day,** Narbonne Ranch, July 11.
**Citrus Institute,** Pomona, July 14-15.
**California Rodeo,** Salinas, July 24-29.
**California Rodeo,** Salinas, July 26-30.
**Yuba County Fair,** Arboga, August 18-20.
**Sonoma County Fair,** Santa Rosa, August 23-27.
**San Joaquin Valley Fair,** Stockton, August 24-30.
**California's Pageant of Progress and Industrial Exposition,** Los Angeles, August 26-September 9.
**Walnut Growers Field Day,** Santa Barbara, September 1-2.
**State Fair,** Sacramento, September 2-10.
**Grape Day,** Escondido, September 9.
**Tehama County Fair,** Red Bluff, September 11-17.
**Tulare County Fair,** Visalia, September 12-19.
**Colusa County Fair,** Colusa, September 14-17.
**Glenn County Fair,** Orland, September 18-23.
**Kings County Fair,** Hanford, September 19-23.
**Fresno County Fair,** Fresno, September 25-30.
**Shasta County Fair,** Anderson, September 28-30.

**Pacific International Livestock Show,** Portland, November 5-12.

## SOUTHERN GOOSEBERRIES

E. C. Hall formerly a gooseberry specialist in the northern part of state now living in Monrovia, writes that by growing the Oregon Champion in lath house and in shade of trees he gets just as good crop of gooseberries as will grow elsewhere in the state.

### Infertile Eggs (Correction)

On page 696 of the Cultivator of June 24, in answer to query as to infertile eggs keeping better than fertile, a typographical error was made, reversing sense of statement made. The second sentence in answer should read: "All market eggs should be infertile." By error the "in" was omitted.

## FOR SALE

One Phord car with a piston ring,
Two rear wheels, one front spring,
Has no fenders, seat made of plank,
Burns lots of gas; hard to crank.
Carburetor busted half way through,
Engine missing, hits on two.
Three years old, four in the spring;
Has shock absorbers 'n' everything.
Ten spokes missing, front axle bent,
All tires punctured, torn and rent.
Got lots of speed, runs like the deuce,
Burns either oil or tobacco juice.
Present owner swears like sin, but—
It's a durn good car for the shape it's in.
—Macon, Ga.

Says Sam: Nobody knows the joy of loafing like the man who works for it.

# Nitrate of Lime

Contains 13% Nitrogen Equal to 15.8 Ammonia

## FORCE YOUR CROP

Use NITRATE OF LIME as top-dressing to obtain the best results. Can be applied under all weather conditions.

C. HENRY SMITH, INC.
311 California Street, San Francisco
(Sole Agents for the Pacific Coast and the Hawaiian Islands)

# Motorcycle "Express" to Town

WHEN you've got to get to the railroad station or post office in a hurry—when you want a sack of feed or some groceries from the store—when you have to get to the far end of the farm or to your neighbor's and back before dark—you can't beat a Harley-Davidson.

You can't beat this sturdy motorcycle for economy and all 'round dependability. Rides comfortably—easy to handle—even on roads that would stall an automobile. The roomy side car carries a surprising amount of luggage. Thousands of farmers have their Harley-Davidsons in use almost every day of the year—paying big dividends in time and money saved.

*50 miles for a dollar—gas, oil and tires—is the Harley-Davidson's average performance. That's REAL economy. Ask your dealer for FREE demonstration, or write us for illustrated literature. No obligation to you.*

*Attractive dealer proposition for unassigned territories. Address Desk A-2.*

HARLEY-DAVIDSON MOTOR CO.
MILWAUKEE, WISCONSIN

**Harley-Davidson**
*World's Champion Motorcycle*

YOUR WANTS FULFILLED AT THE STORE OF RICH BUDELIER, 2531 SOUTH MAIN STREET, LOS ANGELES

We have the Harley-Davidson motorcycle, both new and used; many riders trade in their machines for the new model, but the older models are as good as new—we guarantee them as the factory does the new ones—they will give you the best of service.

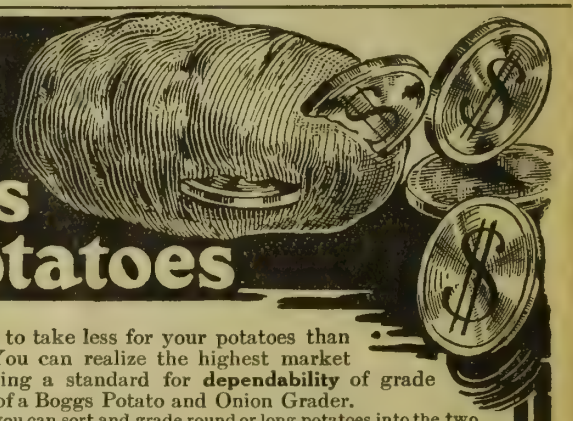
# Get Top Prices For Potatoes



Don't be content to take less for your potatoes than they are worth. You can realize the highest market prices by establishing a standard for **dependability** of grade with the assistance of a Boggs Potato and Onion Grader.

With this machine you can sort and grade round or long potatoes into the two Government sizes and eliminate culls and dirt—all in one operation.

## Boggs Potato Grader

*The Standard Grader*

quickly pays for itself by saving labor and making it possible to obtain 25c to 50c a bag more for potatoes. The Boggs Grader will equal the manual labor of from three to five men.

No experience necessary to operate. It cannot bruise or injure potatoes. Can be installed in field, warehouse, cellar or car. Occupies little space. Is operated by hand, motor or engine. Lasts a life-time.

Made in sizes to handle from 75 to 700 bushels per hour. Six models, $40.00 and up. *Booklet sent on request.*

BOGGS MANUFACTURING CORPORATION
34 Main St., Atlanta, Steuben Co., New York
Factories: Atlanta, New York—Detroit, Minnesota

# THE BOGGS POTATO GRADER

is the Standard Grader adopted by all middle western and eastern potato growing sections. Write or call for prices, booklet or other information.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

This week's cover shows interior of a modern walnut packing plant of the California Walnut Growers Association, and gives an idea of the care taken in hand culling and grading to produce a perfect pack. The lower picture is of the chain driven wooden belts over which walnuts slowly pass where they are hand culled by women after the nuts containing shrivelled or light weight kernels are removed by patented suction machines in the background. In this plant alone over 10,000 bags of walnuts were removed by the suction machine from the 1920 crop, the nuts so removed being of no commercial value. In all foreign countries these worthless nuts are included in the regular pack.

## AFIELD

President Wilbur of Stanford has said that chlorophyll is the foundation of all agriculture. Certain it is that everyone depending on the production of the farm dreads nothing more than the appearance of chlorosis. Be it peach grower, orange grower or the grower of beans or potatoes he realizes the approach of riches when he looks over orchards or fields clothed in the rich dark green of June.

And no grower of things has greater terror than the peach grower when he notes the first tinge of peach "yellows." I saw an orchard the other day which had been wonderful in its production but now, in June time, turning to the sickly yellow which indicates its productive days are over. An independence is gone, even bread and butter, for some growers.

### In Ohio

I never saw such a richness in green as is shown today in Northern Ohio. Abundant rains of last fall and this spring, together with a good growing season, have given magnificent coloring to the woods that border the streams.

The woods are not, however, entirely confined to stream banks, for many a farmer today is engaged in reforesting Northern Ohio. I was on one of this section's biggest and finest farms yesterday and found that a real woodlot is maintained. It covers a hundred acres. It is protected by stock tight fence and all pasturing is forbidden. Some of the trees are only six or eight feet high and stock would soon mean the death of such youngsters Some trees are old, but nearly all were new growth. There were soft maples, buckeyes (horse chestnuts) tulip trees (whitewood) rock elm and many of lesser value but also many of walnut, hard maple, hickory, red oak, trees of high value—to the next generation.

### Different in California

It is different in California. One plants a eucalyptus today and tomorrow—or maybe 15 years from tomorrow—the planter harvests his crop, part of it at least. The eucalyptus craze of a few years ago was not an economic movement on the part of upbuilders but—in many cases at least—a wild effort to fleece the other fellow. It worked, and the fleecing was done proper. We should understand real forestry and when right conditions obtain there should be more general planting of timber trees.

A few of California's water sheds are now being replanted, but this has been done with little consideration of timber value and large consideration of water conservation. "What tree will persist and preserve?" rather than "which will prove of greatest timber worth?" are the questions asked. For all time to come California farmers will want timber to use for lumber, posts, implement repair, steering wheels for autos, masts for radio antennae, corduroy roads, stoneboats, airplane propellors, matches and one thousand and one other things.

What trees are best? What trees will be best adapted to our uses a dozen or score of years from now? Those, with numerous other questions, might well be studied more thoroughly in California, not only studied but freely experimented with until we find our best adapted tree. Here in Ohio walnut and sugar maple are favorites.

### Speaking of Corduroy Roads

In the past 13 days I have ridden on the highways of Utah, Missouri, Illinois and Ohio. I'm going to ride on those of some other states. I'm hoping for a different experience, but as yet my ride has resulted in about the following procedure: At the end of the ride I alight, stand erect, raise my hands to high heaven, look upward and devoutly say—like unto a shout—"Oh! You California Roads!"

I wish those who would secure political advantage by trying to discredit California highways would take a real ride—not over the theoretical engineer's specifications, but over "them roads, as is."

### By Gosh!

For instance: Yesterday I wanted to see the old homestead where I was born. I was told that the old house built of walnut with whitewood siding, and expected to last forever, is in ruins. Nevertheless I wished to see. Brother said: "I don't think the light rain of this morning will prevent. I 'guess' we can make it." The inflection he put on that "guess" made my heart sink.

We started. The first leg was over a road of cinders spread on yellow clay. Pretty good! Then the brick paved street through New London—named from New London, Connecticut, whose citizens settled on 500,000 acres of fire lands which were deeded to the settlers because of losses from Indian depredations. Homes in Connecticut had been burned, livestock driven off and many people killed by Indians. So from New London, Connecticut, to the wilds of "Out West—'way beyond the Allegheny Mountains" came the "Fire Sufferers," blazing trails through the beeches, maples and oaks. And New London, Ohio, was and is.

The corduroy which served the first settlers has been succeeded by diversified other forms of roads. Going toward Buck Creek the road is of brick 4x4x8 on a base of an inch or two of sand. Some are built on a concrete base and stand up better.

Noting that the speedometer hovered close to 15 miles, I suggested to Brother that I though "Ohio laws are much more strictly enforced than those of California, because in California they so often exceed our 35 mile legal limit and people are killed daily."

No reply.

The width of pavement created a rather embarrassing situation once or twice. Fortunately we met few, and after suffcient honking it becomes easy to pass horse drawn vehicles going in same direction. Along either edge of the 12 foot pavement there is a row of cobblestones or sometimes a sort of cement curb. This curb extends upward some five or six inches. Outside the curb thin air extends downward anywhere from one to eight inches.

Why the absence of an "apron" and the use of this curb I couldn't see till I was told "winters heaving frost" was responsible and that the curbing prevented quite such serious damage.

I suggested to the driver that this form of pavement was much safer than in California for there the pavement is so wide that unthinking drivers attempt to go four abreast which makes for complications occasionally. After a space of time about as long as it takes to dodge four holes filled to unknown depth with yellow mud he said:

"Uh—huh."

Meantime we reached Fiddlers Green where the old log blacksmith shop used to be and where the Town Line Road turns west. This road was blazed through the forest about the time the California missions were established. The corduroy has all disappeared but the yellow clay remains.

The job of paving also remains for the next generation. In spite of occasional puddles of water the yellow mud of the newly repaired road proved deceiving and we turned off the pavement. We proceeded west about a hundred feet when the driver made the fatal mistake of getting slightly off the crest of the rounding road and we oozed noiselessly and painlessly into the ditch alongside the road.

My kangaroos still retained some of their California shine, but I boldly jumped into the yellow sea and saved the women and children from the back seat and carried them to a safe piece of sward in a fence corner. I secured as good footing as possible, grappled the rear fender and shouted to Brother: "Step on her." He did. A stream of yellow slimy mud shot 40 feet to the rear. Part of the stream stopped on my new Palm Beach pants.

We never reached Buck Creek nor the old homestead. We're going tomorrow, but not by auto. The rains are continuing and clay roads are getting no better fast. Two fine old drafters are to be hitched to the hay wagon and we'll all take a hay ride.

Pardon the foolishness, but, honest to goodness, folks, we Californians need something to jar us into a realization of our many blessings. Count them every day!

### Sawmills

The old time, established sawmills, with building and complete equipment, have disappeared entirely from this, a diversified farming section. In their place has come the "portable"—an old time steam tractor with belt connection with a big circular saw. These mills move from section to section and work up elm, oak and other timbers mostly for shipping out. Any operation whatever on the part of these mills is made possible by the care and conservation on the part of farmers I believe limited lumbering possibilities will remain permanently because of these "wood lots" maintained in Northern Ohio.

### Manufactures

Even the small quantity of walnut and maple hereabouts has been the cause of the installation of a sizable manufactory here. It makes only automobile steering wheels.

### More About Clay

I have held up to contempt Ohio clay as a road surface. In some later letter I'm planning to show wherein it proves one of the world's greatest wealth makers when molded and burned into drain tile.

## CALIFORNIA OLIVE GROWERS

On another page appears a short article giving the reasons for the organization of the California Olive Growers and the work they hope to accomplish. If the organization is carried on in the manner outlined it will go a long way toward getting the olive industry on its feet once more, and every olive grower should assist by signing up at once.

The most interesting feature in their plans, and to our mind a matter of vital importance in the work of all cooperative organizations, is the statement that the association hopes to reduce the price of the product to the consumer and at the same time pay the grower a price that will remunerate him for his crop. There is too much difference between what the consumer pays and what the producer gets, and when cooperative organizations succeed in reducing this difference to a reasonable amount, it will not only increase the consumption of our farm product, but will be the means of helping to hold the organizations together.

We believe in California. The greatest loss to our highways comes from overloading and then speeding the overloaded truck. There should be a new campaign for a lessening of the abuse of public highways in order that contractors may make larger profits.

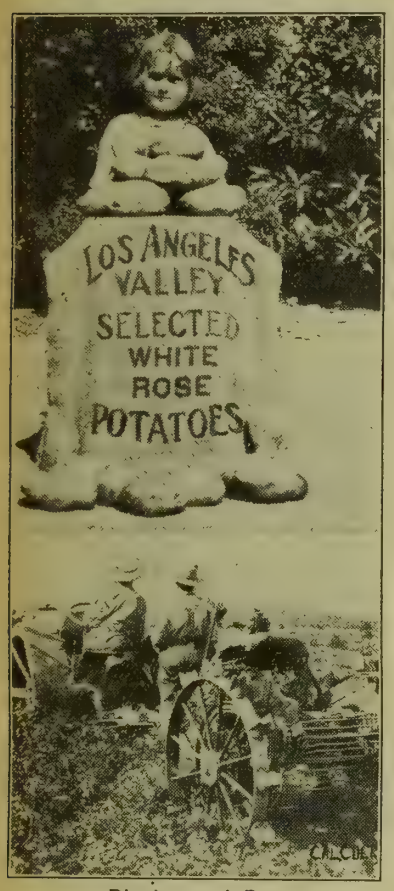
# Potato Field Day

By Ernest Braunton

WEATHER conditions this spring and summer have been unusually bad for the potato growers of Los Angeles County, yet the yield in many well cared for fields will be heavy. But in seasons of bad weather the fields given little care are in a hopeless state so far as yield is concerned. The diseases and pests have also been unusually bad. Records of tuber moth damage from May 10-15 are the earliest ever known in this section.

The potato growers department of the Los Angeles County farm bureau met in the Van Nuys high school auditorium at 10 a. m., June 27, to hear committee reports and papers on progress of phases of potato culture under special observation. The meeting was presided over by E. D. McSweeney, chairman of the department, and a report of the past year's accomplishments was read by him.



Digging and Dug

Below, tractor hauling digger. Above, San Fernando Valley's standard sack and grade No. 1 potatoes from W. V. Stahl ranch.

One of the principal recommendations read as follows: "The potato industry has reached sufficient proportions in Southern California that the question of marketing is of paramount importance. Solutions to the marketing problem have been suggested by various members and by outside agencies. While we may not agree on the final one, I think we can all agree that some sort of organization is necessary, and I for one am of the feeling that the local pooling asociation, although it does fall short of accomplishing all which many growers desire, is a distinct step in the right direction. While ideally it would be desirable for the potato producers to control every stage in their marketing from the grading of the product and its delivery to its sale to the purchaser, in a practical way we cannot accomplish this for many years and the local pooling association provides an opportunity for its members to grade and standardize their product, to establish a local plant and to have some direction over the sales, and is certainly an improvement over the old system. It may be that the industry has reached the point where it can afford to set up its own sales agency, and if this is the case it will be most gratifying. I am inclined to believe, however, that the slower, safer, evolutionary process of developing the local pooling association may prove to be the best solution in the long run."

Next came L. C. Holmes of the farm advisor's staff, formerly for many years a soil specialist for the United States department of agriculture, in a talk on the educational work of the department. He was followed by Mark Grimes of Van Nuys, vice president of the county farm bureau, in a plea for greater membership for the bureau. The speaker said that out of 15,000 farmers in the county but 2,000 belonged to the bureau.

### The Nematode Menace

Farm Advisor Hodgson then took the floor to explain why Prof. E. O. Essig was not present to tell of nematodes, their work and means and methods of control. Mr. Hodgson said the nematode menace was developing rapidly in all parts of the state and presented two serious problems—the one educational, the other regulatory. The state officials are making a special study of the menace and have plots for the purpose in many counties, two in Orange County and two in Los Angeles County. He quoted Dr. N. A. Cobb of the federal service as saying that more life exists below the ground than above and that we have 400,000 kinds of nematodes, only one of which, however, is a serious menace to agriculture. In the top acre-foot some soils contain a small matter of three billion nematodes. In ten acres these insects, though microscopic, would, if placed end to end, make a girdle around the globe. But 80 per cent of them are in the upper six inches of soil and so easily reached if one can find what best to reach them with. Drying out the top six inches of soil will kill many. The nematode is a small worm with a spear in his head with which she punctures the epidermis or skin of plants and then sucks the sap, doing serious injury. The excretions of the insects produce root galls which shut off from the plant part of its water and food supply.

### Control Measures

No eradication measures are applicable to the field. In greenhouses the soil may be steamed, baked or drenched, but such practice is not practicable in acreage. Unfortunately few crops are immune. Crop rotation is the most effective control, planting resistant crops for a period of years and then back to a more profitable crop which the relatively small number of nematodes remaining cannot seriously injure for one to three years. It is a life-long fight, however, for nematodes have been known to survive inactive for 25 years and then revive. The apricot root is nearly immune while the peach root is a favorite host. Potatoes are the most common spreaders of the nematodes.

Dr. G. K. K. Link, pathologist, United States department of agriculture, told of the great losses in transit of perishable foodstuffs, due largely to diseases and insect pests. He stated that when D. G. Milbrath (now with the state department of agriculture) was sent from Washington, D. C., to Southern California several years ago, his first report read: "The most serious problem here is the nematode, but the people do not seem to realize it." Dr. Link said virus diseases were among the most serious, though this is not generally known. A disease known as leaf roll has destroyed 30 per cent of the crop the first year.

In Potato Fields

Top, Assistant Farm Advisor Holmes speaks through the megaphone. Middle, examining fertilizer test plats. Lower, the long potato row.

### Resolutions

Six resolutions were passed unanimously and with but little discussion, the one following without a word except unanimously "aye."

"Whereas, the farmers of California quite generally recognize the menace to the agriculture of the state consisting in the gradual increase in the percentage of land operated by Japanese, and at the last session of the state legislature the alien land act was passed, the purpose of which was to curb and destroy this menace, and the purpose and intent of the act is being daily violated, not only permitting the menace to continue, but setting an extremely bad example, be it resolved, that the Potato Growers of Southern California register a vigorous protest against the daily violation of the spirit and intent of the alien land act."

One thanked the Van Nuys high school for use of building and the Van Nuys chamber of commerce for arrangements for lunch. Another declared endorsement and support of the work of regulatory and educational agencies regarding the nematode menace. One deplored the use by dealers of new names for old varieties and suggested that dealers use the standard varietal classification published in Gilbert's Potato Book. One resolution commended the state agricultural college for establishing a "Division of Olericulture" for the study of vegetables and truck crops. The "meat" of the last one was: "That the potato growers department of the Los Angeles County farm bureau does respectfully request the secretary of agriculture that in the budget for the coming year special provision be made whereby a field investigator may be detailed for at least part time, working with the potato growers of Southern California in the study of problems confronting the industry, and particularly with respect to seed potato production and seed curing."

### Field Inspection

Under direction of L. C. Holmes, field crop specialist, the visitors spent the afternoon in inspection of field plats where various fertilizers had been used and various cultural care bestowed. Mr. Holmes announced that seed curing experiments now being carried out were six in number, as follows: spring crop in cold storage; fall crop in cold storage; greening and sprouting; sweating or curing under straw; whole tuber seed and cut tuber seed.

Various members present were asked to present their views. E. D. McSweeny prefaced his remarks with the statement that the fall crop often gives an unsatisfactory stand and yet this is the crop California growers should raise rather than the spring crop. He said good results were reported from cold storage of spring

(Continued on Page 43)

# Agricultural News Notes of the Pacific Coast

## Northern California

San Quentin grain bags are now selling at 9½ cents.

Humboldt County reports weather cool and corn maturing slowly.

Hot weather in the Sacramento Valley is causing excellent growth of rice and tomatoes.

Codora farm center is raising funds for its exhibit at the Glenn County fair at Orland.

Canneries in the Winters district of Yolo County are taking 80 per cent of of the apricots.

The Sutter Basin Company is cutting a 1,000 acre alfalfa field which was planted last fall.

The Lotus district of El Dorado County is becoming known as a mountain Bartlett pear section.

Thirty-five and 40 sacks of barley to the acre are reported on Sutter Basin farms, wheat running 30 sacks.

The women of Butte County are asking the supervisors for the appointment of a home demonstration agent.

The farm home department of the Alameda County farm bureau held its annual picnic at Hayward Memorial Park, June 14.

Fruit shippers are disappointed at loss of the July 4th fruit trade in eastern markets because of the late maturing this season.

Glenn County farm bureau meetings: Codora, July 10; Orland, 11; Jacinto, 14; Capay, 19; Plaza, 21; Grapevine, 26; Glenn, 28.

The Eden Township Farm Products Show Association has been organized, electing L. R. Rosenberg, president; M. A. W. Lee, secretary-treasurer.

The rest room at the farm bureau office at Oroville, Butte County, is well patronized by women who come in from their farm homes for the day's shopping.

A movement has been started at Yuba City to erect a marble shaft over the unmarked grave of J. D. Phillips of Sutter County who originated the Phillips Cling peach.

Prof. Ralph E. Smith, plant pathologist of the state university, has been inspecting orchards in Placer County to determine cause of the disease affecting pears, plums and peaches.

Placer County farm bureau has adopted the following wage schedule: Unskilled labor, 35 cents; packing cherries 20 cents per box, plums 7, peaches 3, pears 8, grapes 5 cents cleaned.

The Colusa section of Colusa County reports busy days in the harvest field. There was some disappointment because of the north winds and lack of rain while filling which somewhat cut down the yield.

Lassen County has been declared by the state department of agriculture free from tuberculosis in cattle. Under the department's ruling no tuberculous cattle may now be permitted to enter the county.

The Glenn County unit of the Federation of American Farmers has asked the supervisors to redistrict judicial townships, reducing from eight to three. The smaller number the farmers say is amply sufficient to handle business and the reduction will save several thousand to tax payers.

## Central California

Fresno County's Pork Day will be held October 20.

Clavicle, Tulare County, reports fruit prospects much above the average.

Turlock will celebrate Pork Day October 11. 496 entries have already been made.

Canneries at Yakima, Washington, started on Royal Ann cherries June 20. The crop is light.

W. T. Kirkman, Jr., of Fresno, has been reelected president of the Nurserymen's Bud Selection Association.

The estimates of the grain yield on the west side will be far exceeded as indicated by present harvesting operations.

President Giffen of the Sun-Maid Raisin Growers announces that no change in prices will be made until about August 1.

Headquarters of the California Olive Growers Association has been established at 1321 J Street, Fresno. Contracts are now being received.

Harrison Hopkins of Fresno has been appointed superintendent of the cattle and horse department of the Fresno district fair to be held September 25-30.

The daily press announces that a chemist at the University of California has isolated the botulinus germ that has made so much trouble for the ripe olive packers.

Kern County orchardists are bringing fruit to the chamber of commerce at Bakersfield to be processed and kept for display at the county fair to be held September 12-19.

Study of vine diseases will be taken up at a laboratory established by the United States department of agriculture at Fresno. W. S. Ballard is in charge and began his work July 1.

Nurserymen at Springville, Tulare County, report great benefit from the rain and cloudy weather. Young tomato and sweet potato plants have also been kept in splendid condition.

A preliminary survey for flood control has been authorized by the state highway commission, the Merced irrigation district, Merced County and City. $10,000 has been set aside for the work.

Farm home department meetings will be held in Kern County at Shafter, July 11; McFarland, 12; Arvin, 13; Weed Patch, 18; Inyo-Kern, 21; Edison-Fairfax, 25; Kern-Delta, 26; Wasco, 27.

The Sun-Maid Raisin Growers has just made sale of two and one-half million pounds of raisins to an English firm at Liverpool. This practically cleans up the association on soda and sulphur bleached Thompsons.

President Harry Crowe of the Oakdale irrigation district says that more sand is being washed down by the Salinas River than ever before in the history of the district. This has made necessary frequent cleaning of the ditches.

Pouring of cement on the Woodlake-Naranjo-Lemon Cove section of the Tulare County highway is progressing rapidly, an average of 500 feet a day being completed. It is expected the cement work will be completed in about a month.

## Southern California

The first annual Coachella Valley Grape Day at Oasis July 11.

The old Rowan ranch northeast of Perris has been sold to E. W. Pasco of Los Angeles.

The first carload shipment of grapes from the Imperial Valley was sent June 28 direct to New York.

The Alfalfa Growers Exchange has built a warehouse at Brawley with storage capacity of 2,000 tons.

A number of cotton growers from Palo Verde Valley attended the cotton quarantine hearing at Riverside, June 27.

Riverside, San Bernardino and Orange Counties are planning to combine their exhibits at the state fair this fall.

B. H. Stanley, bee inspector of San Bernardino County, says that the crop of wild sage honey this season will be the largest in 20 years.

Four fines of $50 each were last week imposed on Japanese cantaloupe shippers at Brawley for violation of the standardization laws.

Estimates of citrus shipments from the Riverside district for the season are 3100 carloads. Returns will be larger than last season in spite of the frost.

Work on the state highway from Oxnard to Santa Monica is being pushed with a crew of over 80 men blasting and clearing near Point Magu.

Ventura County farm bureau held a well attended picnic at Foster Park last Saturday. Vice-president Peters of the state federation was the principal speaker.

The Beaumont Fruit Growers Association has just shipped consignment of Bing cherries to London by the steamer Cardingshire sailing from San Pedro.

Apricot growers in the Ventura and Ojai districts met at Mill school house Monday of last week to talk over the new contracts of the Prune and Apricot Growers.

Manager O'Neill of the Brawley branch of the Imperial Valley Vegetable Association says they are having an exceptionally fine watermelon year, prices holding up well.

Foresters have been busy in the Santa Barbara national forest controlling brush fires which started near Gibraltar Lake from which the city of Santa Barbara draws its water.

Cantaloupe growers met at Brawley June 28 to discuss regulation of cantaloupe shipments until the market recovers from the heavy daily shipments which have run up to over 560 cars.

Blythe is to have a state plant quarantine inspector. It is estimated that over 4,000 automobiles from cotton boll weevil or alfalfa weevil infested sections have crossed on the Blythe ferry since its opening in January.

The Riverside Press says that a Japanese melon grower at Calexico sentenced to pay $75 or serve 25 days in jail for trying to ship unripe cantaloupes asked the court to put his five year old boy in jail as he didn't wish to pay the fine and was too busy picking cantaloupes to go to jail himself.

## The Coast and General

Arizona alfalfa growers report third crop commencing to bloom.

Lovelock Valley, Nevada, will have an exceptionally heavy crop of alfalfa.

Apple growers of the Wenatchee district of Washington are busy thinning fruit.

The Nevada state fair will be held at Fallon during the first week in September.

Tennessee and Mississippi are making heavy shipments of tomatoes to Eastern markets.

Churchill County, Nevada, Cantaloupe Growers Association has 430 acres in cantaloupes.

The Washington Growers Asociation has withdrawn 1922 prunes from the market as they are practically all sold.

The Arizona state fair management is offering $500 in special premiums for exhibits from boys' and girls' clubs.

County farm bureaus of Greenlee, Cochise and Pima Counties of Arizona have purchased moving picture machines.

The Washington Berry Growers Association is building a new refrigerating plant at its shipping station at Sumner.

The mid-year meeting of the Arizona Cattle Growers' and Wool Growers' Associations will be held at Prescott, July 6-8.

The Northern Pacific Railway has put on two special daily berry trains to carry Yakima and Puyallup fruit to Eastern markets.

Manager Robinson of the Washington-Idaho Wheat Growers Association says that practically all of the 1921 crop of wheat has been shipped.

The section about Flagstaff, Arizona, received two inches of rain last week. The summer rains have begun about two weeks earlier than usual.

The tent caterpillar is doing considerable damage to fruit trees in western Washington. They are also said to be attacking gooseberries and currants.

Nelson B. Rue, secretary of the Virginia Farm Bureau Federation, reports that Virginia farmers are joining the farm bureau at the rate of 1,000 a month.

Hot weather in the watermelon and cantaloupe fields of Arizona has ripened the melons faster than growers would like as they fear the flavor will be injured.

More than 36,000 pocket gophers were killed by boys of Maricopa County, Arizona, in a contest conducted by the United States biological survey and the state university.

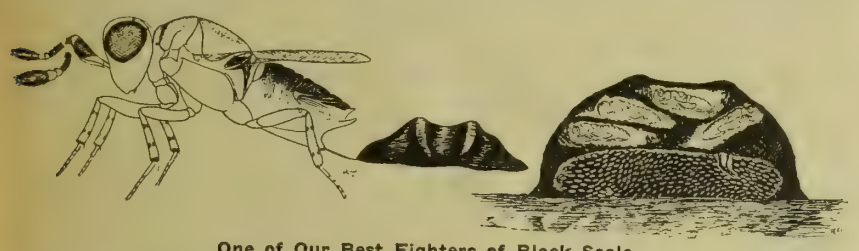
Since June 19 Station WEAO at the Ohio state university, Columbus, has been broadcasting at 1:30 every afternoon complete weather, crop and market reports for all who want to tune in at 485 meters and listen.

Skagit County, Washington, Berry Growers Association has agreed upon price for picking uniform with that paid by Puyallup and Fidelgo Island growers: Strawberries, 30 cents per crate; raspberries, 40 cents per crate with ten cent bonus on two years old or over; 50 cents per crate with ten cent bonus for one year old vines; bonus paid to pickers who stay until end of the season.

# The Black Scale Problem

By Harold Compere, Assistant Entomologist, State Department of Agriculture

THE first step in bringing about the biological control of an insect pest is to establish in the local fauna its most effective natural enemies. This statement presupposes that the pest against which the work is directed is an introduced species which in some locality is held in check by the activities of various other insects which prey upon it. The black scale (Saissetia oleae Bern) is a pest which meets this fundamental requirement. It was accidentally introduced into California, and it is a pest which is held in check by the influence of parasites in the Cape Town districts of South Africa. After successfully establishing in the local fauna the complement of natural enemies which controls the black scale in South Africa the second step will be to make these parasites control the pest in California just as effectively as they do in their native home. At first glance it appears that when these effective South African parasites are established in this state a complete control will follow. In the uneven hatch areas of California where the environment is comparable to that of the Cape Town district such a control will undoubtedly follow, in fact, such control is now well under way in these areas, being brought about by the activities of Aphycus lounsburyi. Whether or not this will be interrupted by the activities of the pernicious secondary parasites, Quaylea whittieri and Eusemion sp. remains to be determined.



One of Our Best Fighters of Black Scale

Photo at left shows the Aphycus lounsburyi female in the act of laying an egg. The parasite is really smaller than the scale which it attacks. This drawing does not show the relative size of the parasite and host. Photo at right gives sectional view of black scale showing pupae of Aphycus lounsburyi with cast meconia embedded in the pupal cells. All drawings of insects greatly enlarged.

### Source of Black Scale Parasites

The most important black scale parasites which we have imported came from the Cape Peninsula of South Africa and from Sydney, New South Wales. The fauna of the Cape Peninsula is rich in parasites of the black scale which are thought to have originated there. There are quite a number of black scale parasites present in Sydney and the adjacent territory. In this latter district the black scale is under natural control, but this control is primarily due to parasites which originated in South Africa and were both intentionally and accidentally introduced into Sydney or its environs. Besides the effective introduced forms there are a few parasites supposedly indigenous in the Australian fauna. It has generally been assumed that a pest is a native to the locality where nature maintains it in balance. Basing our judgment on this supposition we point to the Cape Peninsula as being the native home of the black scale. The ancestral home of Aphycus lounsburyi is undoubtedly South Africa, but the parent stock which gave issue to the California parasites was collected at Epping, near Sydney, by E. J. Vosler in 1918.

### Climate of Cape Peninsula and Sydney

A glance at the map will show the proximity of the Cape Peninsula and Sydney to large bodies of water. This has a tendency to insure uniform temperatures subject to little daily and seasonal change. E. W. Rust reports that the climate of the Cape Peninsula is quite similar to that of the coastal area of southern California and that the climate of Sydney is more humid and tropical. Representative mean annual temperatures for these districts are: Cape Town, 63 degrees; Sydney, 63.1 degrees; Los Angeles, 60.3 degrees. Such climates as these favor the growth of the black scales. The pests complete at least several generations each year so that at any time of the season one hatch is succeeding another.

### Significance of Climate

The manner in which the seasonal development of the scales is influenced by the climate has a direct practical bearing on natural control. It is difficult to say whether the behavior of the scales is influenced so much directly by the climate, or indirectly through effect on the host plant. We find that on certain types of host plants the uneven hatch is the rule regardless of whether the plantings are in the coastal area or in the interior valleys where the climatic conditions are more harsh. On the citrus, namely, oranges and lemons, and excepting the very young trees and sucker growth, the scales develop as even hatch or uneven hatch depending on locality. In the coastal area the scales on the great majority of plants have at least two annual generations and develop very unevenly so that the pest is in all of its various stages of development at any time of the year. On the other hand, the scales which inhabit the citrus located in the interior valleys and mesas develop only one annual generation, and their growth is more or less uniform. This varied type of seasonal development is attributed to the influence of climate. Bordering the coast of southern California a more uniform temperature prevails and the weather is always cool. Toward the interior valleys where the west winds lose their tempering effect the temperatures have a much greater range, and often the summer days become quite hot. The black scale infestations in the interior districts are just as severe as those along the coast, so that in general it may be stated that the climate of practically the entire citrus area of southern California favors the development of the black scales. However, if judgment may be based upon the records of pioneer entomologists, this was not always the case. An examination of the old records and reports indicates that in the days of the pioneers the black scale was only considered a pest in the coastal area which is now characterized by the uneven hatch. This despite the fact that citrus plantings occurred in the interior and that the pest was established there. From this we assume that the black scale in the interior has become acclimatized or has gradually adapted itself so as to flourish under conditions which differ from those found in its native home and that the even hatch with the one annual brood is the result. The black scale parasites we find suited to prey upon and accomplish effective work against the scales of uneven hatch type.

### Aphycus Lounsburyi

The establishment of Aphycus lounsburyi in California was but one important step in the effort to bring about a complete and satisfactory natural control of the black scale in California. It is extremely doubtful if there is any other parasite which can give such a good account of itself in the uneven hatch areas as this species has done. In South Africa there are several unnamed parasites which give promise of being more effective in the even hatch areas. At the present time the state department of agriculture is endeavoring to establish these new parasites in California, as well as to develop a means of increasing the efficiency of Aphycus lounsburyi.

Biological studies corroborated by field experiments resulted in the conclusion that it is very improbable that Aphycus lounsburyi could of its own accord bring about a natural control in the even hatch areas comparable to that gained in the uneven hatch areas where satisfactory work has been accomplished. The work with Aphycus should only proceed with a due regard for this limitation, otherwise insects which might profitably be liberated in favored localities where it is likely they will gain a control will be sacrificed by being placed in orchards where the chances for them to bring about a commercial control are almost nil.

The bulk of the parasites liberated by the state department of agriculture have been placed in the uneven hatch areas where it is very likely they will do excellent work and in time bring about a satisfactory natural control. Roughly defined these areas include the southern section of Santa Barbara County, the southwestern half of Ventura County, limited sections in the southwestern portion of Los Angeles County, the north central sections and western edge of Orange County, and the western border of San Diego County, notably the Chula Vista district. There are a few other districts not included in these defined areas where scale conditions have proven favorable for a natural control and where heavy liberations have been made.

Uneven Hatch

Map showing the "uneven hatch" areas in the southern coastal counties of California. There are a few other rather limited areas that are not shown where a temporary "uneven hatch" prevails at the present time. The shaded areas, with the possible exception of the Potrero and Montebello districts, are supposed to indicate sections where the "uneven hatch" is the rule, in this respect proving an environment for the parasites similar to that found in their native home.

Aphycus lounsburyi passes through four stages during its development, egg, larva, pupa, and adult. In the first three the parasite inhabits the body of the black scale. The immature larva possesses an air line which serves it with a direct supply of air from the outer world. It is likely that larvae which are deriving their air direct from outside will succumb to fumigation as readily as do the scales. The mature larvae are not served by such an air line and are probably not as susceptible to the poisonous fumigation gases. The pupae which are not actively breathing and are enclosed in the body cavity of the scales are thought to be practically immune from fumigations which are directed against the scales. Upon completion of the larval growth the liquid contents of the scale have been consumed leaving only a dry shell in which the transformation or pupation occurs. When the transformation has been completed the insect is ready to issue into the outer world and take up the duties of reproduction. Prior to emergence the adult discards the enclosing pupal skin, cuts out a small circular hole in the scale with its sharp mandibles, and forces itself into the open. Thus it is seen that the destruction of the scale is brought about by the feeding larva. The adult confines its activities to mating, egg laying, and feeding on the honey dew secreted by the scales. The adult life is not known to be in excess of six weeks under artificial conditions when oviposition is prevented. It is well known that in most if not all insects the prevention of oviposition has a tendency to prolong the adult life.

So far as can be determined the adults have no hibernating periods enabling them to survive the seasons of famine when their hosts are not of a size suitable to serve as food. During

the colder seasons of the year the life cycle of the parasite is greatly prolonged. At such seasons the development of the pupa is greatly retarded. The retarded pupal development and the prolonged life cycle does not increase the efficiency of the species in any apparent way whatever. Under favorable conditions when the temperature is high, as in the insectaries, the parasites complete the cycle from the laying of the egg to the emergence of the adult in about 25 days. The other extreme is reached when the insect develops out of doors during the winter months when this same cycle requires about three months. During the season of 1921, adults issued on April 26, from eggs deposited February 3.

### Parasite of the Third Stage Scales

The Aphycus is essentially a parasite of the third stage black scales, the usual run of the more immature forms not containing enough nourishment to enable the larva of Aphycus lounsburyi to complete its development. The selection of certain sized hosts in which to oviposit is a fixed habit with a great many parasites. Female Aphycus show a marked predilection for third stage scales containing an abundance of ovarian eggs. They also readily parasitize smaller individuals of the third stage, commencing soon after the scale has moulted for the second time. Experiments conducted with females isolated in vials showed that the minimum sized scales which were parasitized measured 1.16 millimeter in length, or roughly, one-half inch. A linear measurement such as this cannot accurately define the exact size of the hosts. It is more the content of a scale depending upon the plumpness and convexity which must be considered in defining the size. It must be remembered that scales of the third stage show a very wide variation in size, depending on their age, while the scales of the first and second stage are uniformly small.

In the interior or areas of even hatch, where there is only one annual brood of the black scales and the hatch is comparatively even, the first and second stage scales which are not favored by the Aphycus are found in greatest abundance during the fall and winter or from August to February. Some individuals may be more advanced or retarded than their companions, which will serve to carry a few parasites over the lean periods. However, the great majority of Aphycus which were present in the interior districts during the past year maintained themselves on the limited amount of uneven hatch material which is to be found scattered about throughout the entire district of southern California. The great majority of the scales comprising the annual brood become vulnerable to the attack of Aphycus during the latter part of February or by the middle of March. At this time some of the parasites which overwinter on the uneven hatch or out of season scales shift their activities to the scales of the annual brood. As the temperature rises in the spring and summer insect activity is accelerated. In the late summer of 1921, in the Alhambra district, it was found that 95 per cent of the annual brood in some localities bore evidence of parasitism by Aphycus lounsburyi. Yet a degree of control which would permit a grower to forego a fumigation was not attained. Here the peak of parasitism occurred during June and July after the scales had deposited the greatest part of their quota of eggs, thus providing for a new infestation the following year. It must be considered that this partial control took place only a short time before these scales were doomed to death by old age. All during their growing period throughout the fall and winter they are copiously sprinkling the foliage and fruit with honey dew, providing the medium for the growth of the soot fungus. In a case like this, it is the same as Professor Quayle states in regard to Scutellista cyanea. "The real test of what the parasite is accomplishing must be measured by the ability of the parasite to prevent the emergence of the young scales."

When passing on the condition of the scales it must be remembered that those of the even hatch show a variation of two months in their ages. This is primarily due to the fact that a parent scale lays eggs for a period extending over two months. At certain times of the year there is liable to be a disparity in the sizes of the even hatch scales owing to the difference in their ages. This is particularly true at the season when some of the scales have been in the third stages for two months and those that hatched last are just completing their last moult and passing into the adult stage. If there is a period of warm weather the third stage scales will increase in size very rajidly, while the younger forms will only be completing the stage where the increase in size is very slight. At the time when the scales of the annual brood show a great discrepancy in their relative sizes the orchardist may at times conclude that they are of the uneven hatch type when in reality they are not.

### Aphycus Not Prolific

As parasites go this species is not very prolific, if judgment may be passed on the basis of laboratory experiments. It possesses a very large egg, eighteen of them when fully developed almost filling the ovaries. Life history studies indicate that after the females commence to oviposit the new eggs develop at the rate of six a day. This was found to be the average number deposited for each day of the parasite's life. All of the eggs are not deposited so as to accomplish the most good, nearly always more than one egg is laid in each victim which is selected. The average number deposited in a scale by each female was found to be three. In the very small scales sometimes only one egg is found, while the larger gravid forms will contain as many as 15. In the experimental work the parasites lived an average span of 18 days, depositing a total of about 108 eggs. On the basis of these figures it is found that the progeny of one female will destroy an average of 36 scales. Thus it is seen that a single female cannot accomplish the destruction of any great number. Then consider the fact that the scales of the even brood are only suitable to be effectively destroyed during the months of spring, and this at a time when the life cycle of the parasites is prolonged as a result of the lower temperatures.

There can be a lean period of from four to six weeks duration when none of the scales are of a size suitable to serve as food and the adult parasites will survive this period. They cannot, however, persist in the dearth of third stage scales which lasts over a period of many months duration. In the even hatch areas the adults do not survive the famine seasons in any great numbers but are regularly reduced to the comparatively few which locate the limited amount of uneven hatch or out of season scales. In the uneven hatch areas the parasites are found not faced by the seasons of famine, but are permitted to propagate without being continually starved to insignificant numbers during the greater part of each year.

### Conclusion

It may be stated that much good will at least result, and very likely a commercial control will follow the colonization of Aphycus lounsburyi in the uneven hatch areas, while in the even hatch areas it is very improbable that the colonization of these parasites will result in a commercial control such as would enable a grower to discontinue his fumigation practice. The state department of agriculture is endeavoring to devise a practical method of artifically manipulating these and various other parasites in a manner which will bring about a satisfactory natural control in the even hatch areas.

# Regulations Governing Fumigation of Citrus Orchards

HORTICULTURAL commissioners of Los Angeles, Orange, Riverside and San Bernardino Counties met at Pomona June 20 to draw up uniform rules and regulations governing the work of fumigators operating in citrus orchards for the control of scale pests during the 1922-23 season. H. J. Ryan of Los Angeles, A. A. Brock of Orange, J. P. Coy, of San Bernardino and A. E. Bottel of Riverside were the commissioners who met with R. S. Woglum, entomologist of the California Fruit Growers Exchange, and Inspector K. L. Wolff of Los Angeles.

Some $2,000,000 is annually expended by citrus growers in Southern California in the poison gas warfare against scale pests of orchard trees. During the height of the season, which begins in the fall after the young scale have hatched out, an army of nearly a thousand men is employed by commercial fumigating contractors and growers' associations throughout the southland, covering orchard trees with canvas and applying the charges of deadly hydrocyanic acid gas.

During the winter season of 1921-22 over 28,000 acres of citrus trees were fumigated in Los Angeles County alone, and over $800,000 was paid out by growers for this work. Orange County estimates her expense at $500,000 per year.

Practically all of the work is done at night when the city dwellers are usually far away, but during the winter months on dry nights the automobilist driving through the citrus districts is sure to see the long rows of tented trees in the orchards, and wonder at them.

It is possible that less fumigation will be carried on this coming season than last year because of the frost injury to orchards in some districts. Fumigation is expensive and the grower who failed to realize on a crop last year will be inclined to take a chance this year.

In spite of the fact that in many defoliated groves the scale is less abundant than last year because of the consequent exposure of the insects to the elements, it behooves the grower to beware of future troubles, and, if possible, do his fumigating just the same, for he may be sure that the new tender growth coming out so brightly on the injured trees will furnish such ideal and abundant food for the coming generation of scale, that a very low natural mortality will occur, and an unusually heavy infestation of scale will probably result.

The black scale, which is the variety of most common occurrence here, has the guinea pig, the Belgian hare and the pedigreed White Leghorn hen all standing at the foot of the class when it comes to multiplication. One adult scale will lay from 1000 to 2000 eggs and usually hatch them all. Fortunately for Mr. Citrus Grower, all but 10 per cent or so of these young bugs die before they reach maturity, but when conditions are right for them, a much larger percentage may live and then comes more trouble.

Several inspectors are kept busy all year checking up for the growers on orchard conditions and fumigation results, and others during the fumigating season make nightly trips through the orchard districts keeping watch on the fumigating crews to see that trees are properly covered and measured, and that a high standard of workmanship is maintained.

Requirements and recommendations adopted for the coming season are as follows:

### Requirements

1. All fumigating tents shall be marked in accordance with the Morrill system.
2. The foreman of each fumigating

Solves your insect problem
A NICO-DUST FOR EVERY PEST
this machine priced at ~ $17.50
will dust efficiently and economically anything from truck gardens to trees 25 ft high
One man can cover from 5 to 6 acres per day
WALNUT GROWERS SPRAY MFG. CO.

crew shall be equipped with a thermometer properly tested within the range of 28 degrees to 100 degrees Fahrenheit.

3. All equipment used by fumigators shall be kept in good repair when in use.

4. No pump for liquid gas applications shall be operated having more than three per cent variation from correct measurement.

5. Each tent shall be placed so that one line of numerals runs over center of top of tree.

6. Tents shall be kicked in to hang perpendicularly from outer limbs of tree to ground, and shall touch the ground on all sides.

7. Work must not be carried on when wind is strong enough to cause any appreciable movement of tent walls.

8. Each tree requiring more than a four unit charge shall be taped and correct dosage as called for upon chart given.

9. Trees shall be given not less than 45 minutes exposure regardless of dosage, and work of tent pullers shall be regulated accordingly.

10. Trees shall not be fumigated with pots or cyanofumer when temperature is below 37 degrees Fahrenheit.

11. Trees shall not be fumigated with liquid gas when temperature is below 50 degrees Fahrenheit.

12. Work shall be discontinued when tents begin to become damp.

13. Deviation except by the grower's consent from any of the foregoing requirements will be considered sufficient ground for the revocation of crew foreman's license or contractor's license and certificate to operate.

14. Each fumigator shall submit on the first of each month a report to the county horticultural commissioner showing for each piece of work performed during the previous month: Date, grower's name, location of orchard, number of orange or lemon trees, kind of material used and strength.

15. Fumigator shall keep on file and furnish upon request of horticultural commissioner statement of material used on any piece of work.

16. A chart of each orchard shall be made and kept on file for one year, showing the dosage given each tree and the temperature and time at the bginning of each set. A copy of this chart shall be furnished the grower or county horticultural commissioner upon request.

17. Carelessness in application of materials or other evidence of abuse of privilege to do business under license or certificate shall at all times constitute grounds for revocation of same.

**Recommendations**

1. A written contract between grower and fumigator is recommended. Any deviation from the above requirements authorized by the grower should be mentioned therein.

2. There is considerable danger of tree injury at high temperatures. The danger point is reached in coastal districts, near 75 degrees to 80 degrees, and in interior districts, near 80 degrees to 85 degrees.

3. Daylight fumigation is not recommended at any time except as generally practiced, beginning late in afternoon under most favorable cloudy conditions.

4. Care should be taken not to allow containers of liquid gas to become heated. Keep them in a shady place and keep covered with wet sacks.

5. Leakage from liquid gas containers is extremely harmful to tree roots and care should be taken to keep containers far enough from trees to insure safety.

6. Residue from pots or cyanofumer should be dumped far enough from trees to prevent damage.

7. Operators must bear in mind that many people are not aware of the dangerous properties of the materials used in fumigation and every possible precaution should be taken to guard against accidents. Containers of cyanide or acid in any form should be locked or covered in such a way that the contents cannot be released by children or irresponsible persons.

8. The U. S. bureau of standards, Washington, D. C., and the department of meteorology of the Los Angeles chamber of commerce, 800 Central Bldg., are properly equipped to test thermometers. The seal and certificate of either of these offices will be accepted. A nominal fee is charged for this service.

9. All tents should be numbered serially on at least two sides with black numerals not less than four inches in height.

## NURSERYMEN MAKE PROGRESS IN BUD SELECTION

In his annual report of the activities of the Nurserymen's Bud Selection Association Manager Weeks states that much help is being given by orcharists and others interested in the fruit industry of the state, and that he is well organized to follow up the third season's record taking on California's leading orchards. A membership consisting of more than a dozen of California's leading nurserymen, used three and one-half million buds last summer, which were taken from bearing parent trees which had been selected after two seasons' observation.

F. W. Anderson, promologist for the association, has artificially pollenized some 10 fruits of the leading commercial varieties, the seed of which will be planted by the association and carried on and brought into bearing in an endeavor to find varieties more satisfactory than some of those being used at present.

Frank Dixon appointed by the Canners' League of California to locate desirable strains of canning fruits, reports that much may be expected of consistent and diligent effort to improve the quality of fruits used by the canneries.

William T. Kirkman, Jr., of Fresno, has been reelected president of the Nurserymen's Bud Selection Association; J. E. Bergtholdt, vice president; Max J. Crow, secretary-treasurer; Charles B. Weeks, field manager. The board of directors for the coming year will consist of J. S. Armstrong, Ontario; J. E. Bergtholdt, Newcastle; Max J. Crow, Gilroy; J. H. Elmer, San Jose; H. A. Hyde, Watsonville; W. T. Kirkman, Jr., Fresno; Ruehl Wheeler, San Jose.

California's vegetable crop in 1921 exceeded in value any of her fruit crops with the exception of oranges and grapes. California ranks foremost among the states in acreage, production and value of vegetables other than potatoes or sweet potatoes.

## OLIVE GROWERS SHOULD HAVE AN ORGANIZATION

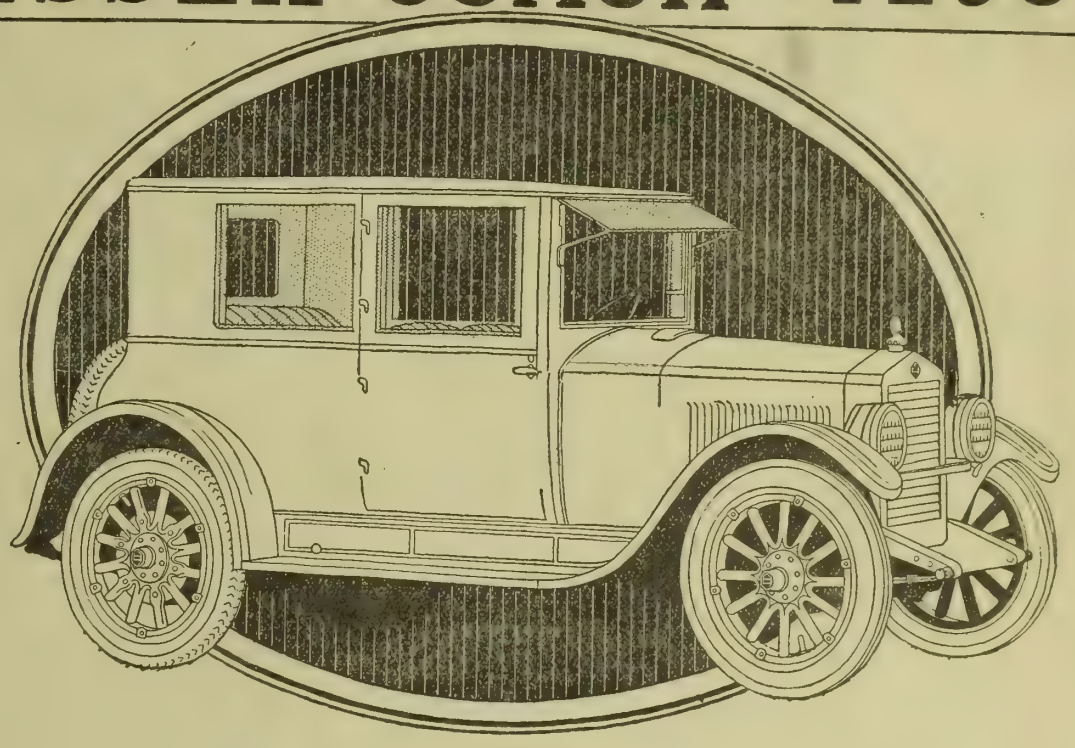
The Kern County Farmers Weekly says: "Prosperity for the olive growers is as certain as the prosperity that is now being enjoyed by the peach and raisin growers, but dependent entirely on organization. Unless the olive growers organize they can never hope to secure even a fair price for their crops. The peach and raisin growers did not gain a living price for their product until they banded together. Follow in the path of progress and prosperity which has been so clearly defined by the peach and raisin growers."

Offices of the California Olive Growers are opened at 1321 J Street, Fresno.

Oil globules are the best ball bearings. Lubrication lengthens the life of farm machinery more than any other single thing.

"The sluggard will not plow by reason of the cold; therefore shall he beg in harvest, and have nothing."—Prov. XX-4.

# ESSEX COACH $1295



## All Year Comfort and Dependable Service

With all the noted qualities of the Essex chassis, the Coach combines closed car utility, comfort and distinction, at an unrivalled price.

Note how little more it costs than the open car. That is made possible by great production. More Essex Coaches are now built than any other fine closed car.

You must see, examine and drive it to realize what is offered at this price.

### Built to Endure Hard Service

The type of body construction is the newest. It gives a durable, comfortable type, of appealing distinction. But, perhaps more important, is the far quieter car that results. The Essex Coach construction absorbs and annulls practically all "drumming" noises of the closed compartment.

And the Coach is a product that will endure in good, useful service for years. Come see, and drive it before you buy any car.

### What Owners Say The Real Proof

There is a simple way to get the real truth about any car. Why buy blindly?

You have the all-important advantage of being able to ask owners. Make use of it. Find out how any car you think of buying has served others. What mileage does it give on gasoline and tires? What are upkeep costs? Is the second or third 10,000 miles just as satisfactory as the first? What is the future expectancy of good service after twenty or thirty thousand miles?

Just ask owners of the Coach how solid and quiet and free from rattles the body stays. How comfortable and easy it rides and handles. The satisfaction of owners is the best proof of all. We want you to know what Coach owners think because we believe their enthusiasm will win you, too.

Touring, $1095 Cabriolet, $1195 Coach, $1295 Freight and Tax Extra

ESSEX MOTORS, DETROIT, MICHIGAN

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Gum, Mildew and Gophers

What is the best remedy for gum that is discharging from limbs and trunks of young prune trees? What spray would you advise for mildew on roses? What is the best poison for gophers?—Subscriber, Cupertino.

Prunes and plums "gum" more than any other deciduous fruit trees, sometimes with but slight provocation. Of course it indicates trouble. When discharge is general, as in this case, it is probably from rot. It may be bacteriosis. The former is fungous, the latter bacterial, but effective treatment is largely the same. The best time for treatment is just at time blossoms are opening and a second dose when blossoms are well opened. But sprays are good at all times. Cut out worst affected limbs, if possible, and spray with a strong Bordeaux, seven and a half pounds copper sulphate and eight pounds lime to 50 gallons water. As stated, the best time to apply is in spring. Sulphur is still the best remedy for mildew, either dry or in a liquid form, the latter a commercial mixture. The best gopher poison is made as follows: Sweet potatoes, parsnips, or carrots, eight quarts; flour paste, half pint; strychnine alkaloid, powdered, one-fourth ounce; saccharine, one-sixteenth ounce. Chop vegetables into one-half inch cubes; make thin flour paste by boiling few minutes; stir strychnine and saccharine into paste and pour all over vegetables, stirring latter until all are coated.

THE WORLD'S BEST KNOWN TREAD

The average motorist today, in almost any country, can identify the Goodyear All-Weather Tread at a glance.

But not every man who recognizes this famous tread realizes how scientifically it is designed to its work.

Examine the All-Weather Tread and you will see that it is made up of large blocks which overlap circumferentially, presenting a continuous ground contact, which lessens vibration and strain.

Being sharp-edged and keen, these blocks have no tendency to slide over slippery surfaces; on the contrary they cut deep and grip tight.

In snow and mud, in climbing out of car tracks, in starting and stopping, the All-Weather Tread digs in and clings, giving positive traction on almost every surface.

The diamond-shaped blocks always present a right angle to the direction of side-slip; against skidding they hold firm and true.

If you have the All-Weather Tread under you, you can motor in confidence, and with pronounced economy as well.

It is one of the important reasons why more people ride on Goodyear Tires than on any other kind.

GOODYEAR

*Study your wheat at threshing time.*

OF course, you are very busy then but it will pay you to take time to find out not only the yield but the real quality.

Is the weight per struck bushel up to the standard ?

Does it grade high enough to bring the top price in your market ?

Is the weed seed box free from light chaffy wheat grains ?

Has the clover and grass made a good set in the stubble ?

If not, why not ?

Six years of Potash starvation has had its effect on wheat lands. Enough German Potash has now come forward, so that those who wish can buy wheat fertilizer with 4 to 6 per cent. of Potash. Potash prices are now much lower.

Tell your dealer now what you want and insist on having it.

*Potash Pays*

SOIL AND CROP SERVICE, POTASH SYNDICATE, H. A. HUSTON, Mgr.
42 Broadway New York

### Many Garden Troubles

What can one do now for wooly aphis? I sprayed with lime-sulphur when dormant and twice later with "black-leaf 40" but some aphis remains. Some apples have pink spots on them. How can I get rid of wire worms? What shall I do for nematodes in blackberries? What ails my asparagus? The plants bush out and go to seed, stand is very thin, should it be replanted?—Subscriber, Bellflower.

The only thing one can do now is to keep wooly aphis from coming out of the soil. Make a basin close about the tree and fill with the old fashioned kerosene emulsion. When trees are dormant spray carefully, especially at ends of twigs, with any miscible oil spray; that will penetrate cracks and crevices where lime-sulphur will not. Pink spots on apples are due to San Jose scale. Lime-sulphur—one to ten—will eradicate them, but treatment for all these sprays may be found in the "Pest Number" of the Cultivator, September 24, 1921. If you have not kept one, we will send it on request. Nothing can be done for control of nematodes except to plant crops they do not feed upon. You do not state age of asparagus bed; if old, it would be better replanted, but asparagus is a gross feeder and soil should be rich with stable manure. Thin asparagus usually indicates starvation.

### Strawberries for Imperial

What varieties of strawberries are best for Imperial Valley? Would plants propagated there be as good as those from outside? It is my idea that it would be best to secure plants from a higher altitude and cooler climate?—Subscriber, Nuevo.

The varieties most grown in the south end of state are Banner, Brandywine, Carolina and Klondike. One large grower in the hottest section about Los Angeles grows Klondike and Banner. We would do just the contrary to your proposal as regards plant supply. Procure plants from the hottest, driest locality possible. If none are available in Imperial Valley we would suggest that stock grown in Salt River Valley, Arizona, shoud be better than stock from coastal districts.

### Drying Pears

Can Bartlett pears be successfully dried in sun? Should they first be sulphured same as apricots?—Subscriber, Simi.

Answer to both questions—Yes. While sulphuring is not necessary, the color, flavor, and keeping qualities of fruits are better when sulphured.

### Coleus

My coleus plants do not leaf out on one side on some plants, on others the leaf seems to unjoint from the stem. Do coleus need water every day or should they be kept dry?—Subscriber, Selma.

We cannot think of any cause for the coleus trouble unless the plants are infested with mealy bugs, as nearly all coleus are. The insects could cause the trouble. Coleus require shade and moist soil, never dry, but should not need water every day. A light, free soil is best, whether plants are in pot or garden.

### Slugs on Trees

Can you give me a remedy for slugs on cherry trees? Will they finally destroy the trees?—Subscriber, Lodi.

Slugs cannot destroy trees except by eating all the leaves, then the trees would starve. A spray of Bordeaux mixture is effective, either in dust or liquid form, especially if the blue vitriol content is strong. Some place poisoned lettuce at foot of trees, and this has been found very effective in gardens. It is used in the proportion of one pound calcium arsenate to 16 pounds chopped lettuce. Cabbage, kale, alfalfa or clover may be used if lettuce is not available.

### Moles?

Moles are very bad in my garden. I have tried to poison them, but they will take no poison. Have tried trapping, with no success. They have eaten jujube seed and all my beans and peas.—Subscriber, Burbank.

Moles do not eat vegetation, but live on insects. They may occasionally eat off a plant that lies in their way, but will avoid it if possible. Neither are moles ever numerous. It may be that field mice or other small animals use the mole runs and eat the seeds and plants; the moles do not. If you are sure moles are present, trapping is the only way to get rid of them, and the "scissors" type of trap is better than the "harpoon" type. The plants eaten would indicate presence of mice or else you have gophers instead of moles.

### Wire Worms

I planted melilotus in fall and plowed under in June, then planted Lima beans, but had to replant later and got a good crop. Since then wire worms are so bad I can raise no crop of any kind. Would plowing cover crop earlier or at any other season tend to prevent wire worms? Does melilotus encourage wire worms?—Subscriber, Huntington Beach.

Plowing in January or February will kill many of the wire worms, the earlier in the year the better the effect. Nothing about melilotus has a peculiar attraction for wire worms. Ventura County Lima bean sections have succeeded in raising beans on lands so seriously infested with wire worms that seed has been destroyed before plant became established. Their procedure has been to use pieces of potatoes buried in the soil near to the seed just planted. The field is inspected daily, a man going rapidly from bait to bait, which has been marked with stake and bright colored marker. The bait is carefully lifted from its hiding place in the soil and is often found to be covered with many of the wire worms. Shake the worms from the bait into a bucket containing small quality of oil. The bait is replaced in the soil, the inspector passes to the next, and so on. One grower says two sacks to the acre of agricultural lime will clear soil of wire worms.

### Red Spider

Enclosed find leaves of Kelsey Japan plum tree three years old. Can you tell me why leaves have fallen and the remedy? A week before leaves began to fall the tree was freely dusted with dry sulphur.—Subscriber, Fresno.

Under the microscope leaves show heavy deposit of red spider eggs along edges; no insects found. The leaves also show excoriations by insects, and doubtless they have also worked

aobut stem of leaves, on twigs. The sulphur dust applied a week before leaves fell would not remedy injury done weeks before. Now that eggs are laid the insects are doubtless dead and gone and no present remedy is necessary. An article on spider appeared in issue of July 1.

### Bermuda Grass

Enclosed is a specimen of grass growing in alfalfa field. Please give name and let me know if it wouldn't be advisable to use it for a lawn on a ranch where one has no time to run a lawn mower. Where can I get the seed?—Subscriber, Oakland.

This is Bermuda grass, a serious pest in many sections and with many crops. It is extensively used as a lawn grass in the Southern states but is not welcomed in California. We do not know of a seedsman who carries the seeds and if you have it and desire to make a lawn, you may save your own seeds or sow the chopped up roots and keep well watered for ten days; you will get all the stock of it you wish very quickly. It is injured but not killed by hard frosts and makes the toughest and most serviceable of lawns but is by all considered a serious pest.

### Sweet Potatoes

Where can I get the Porto Rico sweet potato and who grows them in California? How does it compare with the Nancy Hall?—Subscriber, Baldwin Park.

We find the Porto Rico listed in the catalogs of firms advertising in the Cultivator. It is not such a favorite in your section as Nancy Hall or Yellow Jersey. The first is the earlier but the Jersey is the better keeper.

### Cucumber and Cabbage Pests

A yellowish green bug with black spots is eating on the cucumbers, melons, beans and tomatoes, eating holes in the leaves. What is it and what shall I do to kill it? Green worms are eating the cabbages just as they are heading; please prescribe.—Subscriber, Chowchilla.

The bugs are diabrotica, or cucumber beetle, having 12 black spots. Relief must be prompt and thorough, so we have answered at once by mail. Two sprays have been found effective, use either. Mix six to ten pounds of arsenate of lead to 100 galons of water, or add six pounds of arsenate of lead to 100 gallons of Bordeaux mixture. The same sprays will do for cabbage worms when plants are young but not after heads are half grown. Spraying with white hellebore is safest and kills the worms without endangering the consumer. It may be used dry, as purchased, or mixed with two or three times its weight or bulk with lime, flour, or any fine powdery material. If used as spray soak one ounce in a quart of boiling water and when ready to use add a quart of cold water.

### Vine Disease

I have a disease in my vineyard. Last year the leaves all turned red and fell off before the grapes were ripe. The grapes ripened but were sour. Can you tell me what to do for them? So far this year I have found one or two vines with it, starting to turn red in the little veins of the leaves.—Subscriber, Hopland.

From the specimens of leaves and symptoms described it appears that your vines are suffering from Spanish measles, red leaf, or California vine disease, all names for a trouble which is quite prevalent in all grape districts and regarding which there is little if any information available. The United States department of agriculture is establishing a laboratory in Fresno for the study of this and other plant diseases. It is probable that it will take several years to determine the cause and remedy. In the meantime use the best methods of cultivation and care in your vineyard.—F. K. H.

### Walnut Tree Diseased

We have a grove of Placentia walnuts, all looking healthy but one. Its leaves, instead of maturing like the others, seem to be at a standstill and the nuts are less than half the size on the other trees. We thought perhaps you might be able to suggest something to do.—A Subscriber.

The symptoms you have described are similar to those in a number of walnut troubles. One of the most common is the walnut foot rot. This is characterized by a decay in the roots. It is first apparent in the top with the leaves coming out small in the spring or, if it shows up later in the season, with sudden wilting of the leaves. It used to be called "heart failure" of walnuts because it produced a sudden death of the tree. The reason why the tops respond in this way is because the circulation is cut off between the roots and the top by the decaying of the bark in the roots. Usually the disease is beyond treatment when it becomes so severe that the top is affected, but if it is found before it has progressed far into the roots it can be stopped and the tree saved by cutting out the bark back to healthy tissues. It usually occurs where the soil has been kept damp around the trunk and where the soil is above the graft union. This disease occurs most commonly on Southern California black walnut stock. It is not found on the Northern California stock nor on the English walnut stock. There are other diseases, however, which can cause a similar effect on the top. If the tree is entirely girdled by crown gall the circulation also becomes cut off and the top starved. Crown gall should be cut out before it has progressed sufficiently to effect girdling. Too much water and also drouth will cause a similar condition.—V. F. B.

### Tokays and Emperors in Imperial

Answering query as to Tokay and Emperor grapes in Imperial Valley:

We believe it has been the experience of grape growers in the Imperial Valley that the Emperor grape does not color as well as it does in other districts. This would probably hold true with the Tokay grape, although the writer does not know of this variety having been planted experimentally in the valley. It is possible that other methods of culture may be de-

# A Tough Battery for Rough Trips

Long, hard runs—rough roads—extremes of hot and cold. That's the everyday life of the battery, and the reason why the lowest cost battery to have is the *toughest*, most *powerful* and *durable* battery you can buy.

Hundreds of thousands of owners have found this to be the Willard Threaded Rubber Battery. They find the best possible assurance of long battery life and low battery cost in the *tough* Threaded Rubber Insulation between the *tough* Willard plates.

vised which would promote better coloring of grapes, but at the present time we do not know of any such methods.—F. K. H.

### Suckering Corn

How often should sweet corn be suckered and how high up the stalk should suckers be broken off without danger of breaking out coming ears?

One suckering is enough if done at the proper time. The proper time is just as the tassels begin to show. The suckers to remove are the ones that come from the ground or those coming from the first joints above the roots. The corn should be hilled enough to cover any roots that show. —D. F. R.

### Orange Budwood

I would like to get from 200 to 300 orange budwood. Can you direct me to some party where I can obtain them? They must come from good bearing trees.—Subscriber, Newman.

The Fruit Growers Supply Co., Consolidated Realty Building, Los Angeles, has a bud selection department furnishing citrus budwood from record bearing trees of all the commercial varieties. This company is a subsidiary of the California Fruit Growers Exchange and the purpose of the bud selection department is to assist citrus growers in obtaining more uniform types of fruit and larger yields.

### Budding Back to Peach

I have some 200 eight year old apricot trees that are budded on peach root. They are not producing as they ought to. Would like to know if it would be good policy to bud them to peach again? Could I bud them this coming August, or should I wait until spring and graft them?—Subscriber,

The question of whether or not it would be advisable for you to bud 200 apricot trees that are now growing on peach roots to peaches is a difficult one to answer. Under some conditions such budding might be entirely successful, for instance, if you could in some manner encourage the growth of suckers from the peach roots and bud those suckers while they are yet young, gradually removing apricot tops, it is probable that some time in crop production could be saved, however, there is an element of risk and it is doubtful whether you would be able to get a uniform orchard by this method. We would suggest that before you attempt this or before you decide to remove the apricots it would be a good plan to try different methods of cultivation or pruning which would tend to promote fruitfulness. It may be that you have pruned too severely or perhaps the variety of cots you are growing are not good self-pollinators, and that the grafting or budding of an occasional limb to another variety would solve your problem. If this will not remedy your condition then we believe it would be more profitable for you to remove the trees and start again with new trees. Be sure, of course, that the new trees are free from disease and have a record back of them which would eliminate the possibility of poor bearing qualities.—F. K. H.

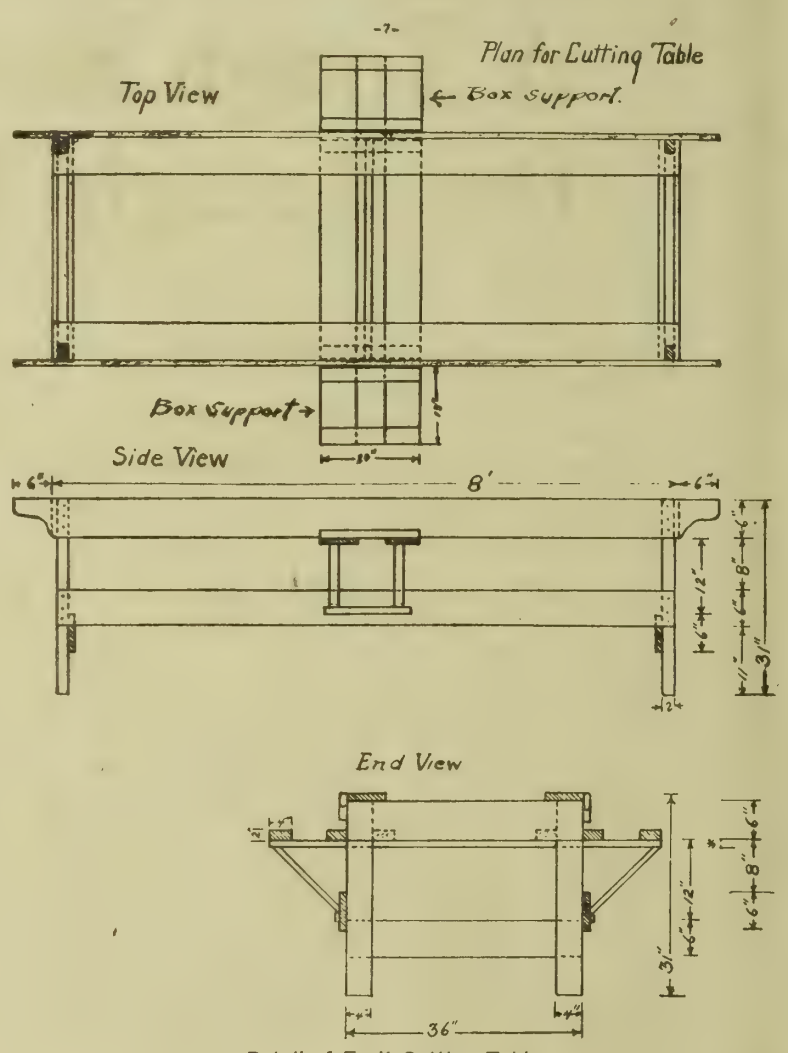
### Rabbits Have Sore Feet

One of my rabbits developed sores on each of its front toes, small abscesses. Also had milky discharge from eyes at same time. It died. Another is now affected in the same way, young of the one that died. The old one was 2 years old, the young one 1 year.

The sores on feet are from bruises on feet affected by dampness and dirt. These should be treated as boils. Can paint them with glycerine and iodine half and half, putting animal in dry hutch on straw. After sores have begun to dry up and heal use any good salve, wiping off any excess so animal will not lick too much of it. You will notice that it is hereditary, so would suggest getting rid of that stock. Many unbred and those bred from infected stock are often thus afflicted. Keep none but strong healthy stock.—W. D. W.

# Plans for Practical Cutting Table

By L. C. Barnard, Division of Pomology University of California



Detail of Fruit Cutting Table

This cutting table was designed and built by the writer in the University's experimental dry yard at Davis and has proven to be very practical. The first table was made from scrap 1x6 inch material, which had been used as forms for a concrte sulphur house, and took only the short space of an hour to build.

The cutting table shown on the drawing will handle one 3x8 ft. tray, one 3x7 ft. tray, one 3x6 ft. tray, two 3x6 ft. trays, two 3x4 ft. trays, three 3x3 ft. trays, or four 2x3 ft. trays, and can therefore be adapted to any size of tray the grower may have on hand. As can be seen in the photograph, four cutters can be conveniently placed around the cutting table, or it makes an ideal table for family groups of six if necessary.

The table can be made of any scrap material on hand, however 1x6 inch material makes a very substantial cutting table. As indicated in the photograph and drawings, the top is not solid, thereby eliminating unnecessary use of lumber and excess weight. In fact, the table is merely a frame built to accommodate any and all sizes of trays.

Following are the dimensions and a photograph of the table.

### FIG PROSPECTS

By I. J. Condit, Horticulturist, California Peach and Fig Growers

The crop prospects for figs are good in some sections while in others the trees have been somewhat injured by last year's frost. There are four varieties of figs grown commercially in California, namely: the Adriatic, the Calimyrna, the Mission, and the Kadota. The White Adriatic is the leader as far as tonnage is concerned. The Adriatic border trees and orchards have been more seriously affected by extreme conditions last season than orchards of other varieties. In most cases, however, the new growth is appearing more vigorously than was at first expected and the crop will probably not be reduced greatly. This frost damage has been noted throughout the Sacramento and San Joaquin Valleys and undoubtedly is the result of conditions which have been coming on for several seasons.

The Calimyrna trees are in most cases in excellent condition and the large crop of caprifigs has made it possible for growers to meet the caprification in most districts. The Mission fig trees have suffered somewhat from frost in certain sections, and the first crop in many cases is very much reduced or almost negligible. The main crop, however, will probably be as large as ever.

Kadota figs have been planted during the past two or three years in widely separated sections such as Fresno, Planada, Empire-Waterford section of Stanislaus County, Stockton and Orland. Most of these developments are too new to show what success can be obtained with the Kadota figs as a commercial crop. The prospects are, however, that the Kadota will stand unusual weather conditions better than the other varieties.

The crop of caprifigs in the Fresno section has been exceptionally good, although the supply has been none too great. The season is about 10 days later than last year but this will delay the ripening of the crop in August only a few days. The association has planted 50 acres of caprifigs in East Orosi, which is expected to assist growers to get a bountiful supply of figs at a reasonable price.

First crop Mission and Kadota figs are ripening rapidly on account of the warm weather in the San Joaquin Valley and these figs are appearing in increasing quantities on local markets. The picking gangs organized by the association will be put in the Kadota orchards to pick the first crop for canning. The second crop Kadota figs will ripen beginning the last of July and continue during August and September.

The dried figs in bulk will be put in standard boxes and cartons for distribution at all grocery stores. The new product known as Fig Meat, is made from the best quality of dried figs. The fruit is carefully selected, washed and sterilized and then put through the grinding machine. The same product pressed into sweetmeats and wrapped in paper is being put out in wholesale lots for distribution in grocery and confectionery stores.

**Victory Tree Spray**

April 25th, 1922.

Victory Tree Spray Co.
Pomona, California.

Attention, Mr. Pinckney.

Gentlemen:—

In reply to your inquiry regarding the spraying you did for us last season, will say that Mr. J. Bolser, the Deputy Horticultural Commissioner for this district, has just finished inspecting my grove, and reported to me that the grove is very clean, and says that I got at least a 95% kill, without doing any noticeable damage to the tree.

Yours Truly,
ALBERT H. MORGAN,
(Copy) Secretary.

PACKERS OF AIR LINE HONEY

# National Fruit Selling Agency

THE American Farm Bureau Federation announces that the Federated Fruit Growers, Inc., established at the recommendation of its Fruit Growers Marketing Committee of 21, has now completed arrangements for the establishment of a nation-wide sales and distribution service for its members. A contract has been signed with the North American Fruit Exchange whereby the force and effectiveness of the two organizations are brought together under the name of the Federated Fruit Growers, Inc., effective January 1, 1923.

The North American Fruit Exchange has been operating as a nation-wide, non-speculative sales agency for fruit and vegetable products since 1911 and is now being used by a large number of cooperative associations and is said to be the largest of all sales organizations serving the general fruit and vegetable industry. The arrangement is effected in order to give the Federated Fruit Growers' members the advantage of an experienced sales service immediately. Arthur R. Rule, vice-president and general manager of the North American Fruit Exchange, will become general manager of the Federated Fruit Growers, Inc., beginning January 1, 1923. Sufficient tonnage is already assured to make the new cooperative sales service a pronounced and continued success from a business point of view.

Commenting on the uniting of the North American Fruit Exchange and the Federated Fruit Growers, Inc., recently organized under the auspices of the American Farm Bureau Federation, J. R. Howard, president of the latter, made the following statement today: "I believe this to be one of the greatest accomplishments yet made in the development of cooperative marketing and in the elimination of waste between the producer and the consumer.

### Eager for Relief

"For a number of years past the sentiment of the farmers of the United States has been developing for relief from the ruinous competitive conditions between individual farmers, which subjected them to the manipulations of speculators, causing a reduction in the price to the growers of fruits and vegetables, without a relative reduction in the cost to the consumer.

"This has come to be so clearly recognized that acts of congress and of nearly all the states have been passed permitting the farmers to unite in cooperative marketing associations and President Harding in his address to the Agricultural Conference held in Washington last January emphatically urged the farmers to unite in such cooperative associations on the ground that the prosperity of the entire country depended upon their doing so.

### Farm Bureau Committee

"The American Farm Bureau Federation a year ago appointed a national fruit committee to make an exhaustive study of the marketing of fruits and vegetables. That committee about six weeks ago brought in its recommendations, as a result of which an organization was formed known as the Federated Fruit Growers, Inc. The latter at once set about the task of establishing an organization able successfully to serve the growers in all the complex problems of marketing, including the actual salesmanship in the markets, the work of sales managers at central distribution points, the economical routing of traffic, obtaining car supply, the organization of local, district or state cooperative associations, accounting, financing, etc.

### Cooperators Cooperate

"After a thorough examination of the field, the Federated Fruit Growers, Inc., decided rather than go through the dangerous and expensive early process of getting together from various sources men with thorough knowledge of and experience in the various departments of marketing, and moulding them into a cohesive capable functioning organization, it would be far better if they could acquire as a nucleus some one of the few national distributing companies now successfully operating. By a process of elimination they soon concluded that the North American Fruit Exchange was the only organization which met all the requirements.

"Negotiations were opened up by the Federated Fruit Growers, through its head, J. S. Edwards, and its attorney, Aaron Sapiro, specialist on cooperative marketing law, with Arthur R. Rule, vice-president and general manager of the North American Fruit Exchange, resulting in the plan to unite these two great cooperative forces."

Mr. Rule, who is a "dirt farmer" by birth and early training came originally from Kentucky. He has long been engaged in the marketing of perishables.

# Why the California Olive Growers

By A. M. Drew

POSSIBLY some olive grower may ask why another organization, and at first glance it may seem unnecessary as there are two organizations in existence at this time, viz: the California Olive Association, and Associated Olive Growers.

The California Olive Association is an organization of packers in the interest of packers, and so far as the history of the olive industry of California is concerned, the packer has usually looked out for himself. When the business was prosperous he paid a fair price for the product, but if it was a little slack he allowed the crop to rot on the trees.

The Associated Olive Growers, if we understood its purpose, was never intended to control the marketing of the product.

The California Olive Growers is an attempt to form an organization, the chief purpose of which is to engage in marketing the olive crop, and incidentally, to do everything necessary to carry the marketing to a successful result. If standardization of a product is necessary to successfully market the crop, then to standardize; if advertising is necessary to marketing, then to advertise; to process the fruit according to the very best methods and to see that every other packing house does the same; in fact, to do anything and everything necessary to make a success of the olive industry. Hitherto, every packer has been trying to produce a more desirable product than any other packer, with the result that the best product has been selling in competition with the poorer product from every other house. Each was cutting the other's financial throat at the expense of the grower.

Hitherto the grower has been led to believe that only the packer could cure and pack olives and that his business was simply to keep at work growing olives and turning them in to the packer, taking what he, the packer, might see fit to give him.

There is no more nutritive and palatable food product than the California ripe olive, the oldest known to man, the most desirable from infant childhood to old age where known, a combination of bread and meat upon which mankind will live, labor and thrive longer and better than on any other product known.

Under the present methods of marketing established by the packers, the olive is made a luxury. None but the rich can afford them. The processed queen olive retails at $2.50 to $3 per gallon. There are on an average 200 of these olives in a gallon. They are sold at 25 cents for six olives on the tables of our high priced hotels, restaurants and dining cars, or $16.50 per gallon, with the result that few eat olives, and few olives are eaten. The cheaper grade are from $1 to $2 per gallon, and these prices are prohibitive to many.

Under the present improved methods of conservation, processing and canning, an excellent grade of olives should retail at not to exceed 25 cents per quart. At that price they will compete with meat, butter and eggs, and will much reduce the cost of living. This is the object and purpose of California Olive Growers, viz: to increase the grade and quantity and to lower the price to the consumer and to maintain a fair remuneration to the grower for his investment and labor.

The plan of operation, no doubt, will be to do as the raisin and peach growers have done—that is to build packing houses where needed, to provide money to the grower to harvest his crop and to see that he gets a fair living price for what he produces. To this end, every olive grower in the state is invited to join with us to help make this great industry a success. We have nearly 40,000 acres of producing olive trees in the state. We have a market beyond compare and capable of doubling, trebling and quadrupling. Shall we throw it away, or shall we make it what it deserves to be?

---

Two years investigations of methods of holding avocados in storage have been completed by members of the staff of the state college of agriculture. It is determined that the fruits are kept in best condition at a temperature of 40 degrees Fahrenheit. Lower temperature tends to brown and wilt.

### IRRIGATION INCREASES WALNUT CROP

In 1919 one out of every eight California farms grew walnuts and the trees which were irrigated produced over 11½ per cent more per acre than the unirrigated trees, according to the University of California college of agriculture. The great value of supplying irrigation water, especially in years when the rainy season is late, has been thoroughly demonstrated in tests carried on by the state college of agriculture in cooperation with the Walnut Growers' Association.

A new correspondence course on walnut culture given by the college of agriculture includes a lesson on irrigation of walnuts. A detailed description of the course may be found in Circular 113 which can be obtained on request from University of California College of Agriculture, Berkeley, California.

### TELEGRAPH AND RADIO SERVE THE FARMER

Greater use of the telegraph in collecting and disseminating international crop reports has been decided upon by the International Institute of Agriculture at Rome. The reports will be broadcast by radio by the United States department of agriculture as rapidly as received, thus making the information quickly available to American farmers.

---

Half of the standing merchantable timber remaining in the United States today is to be found in the three states of California, Oregon and Washington.

COMPARE THE PRICE OF

# Remco Tanks

With Prices of Metal Tanks of Same Capacity and You Will Find the Remco Redwood Tank Much Cheaper. It is Also Better and More Lasting

We will ship you, immediately on receipt of order, any standard Remco tank of the dimensions or capacities shown below at the prices here listed:

**WATER AND OIL TANKS**
**Made from 2-inch Clear Air-Dried Redwood**

### IN CALIFORNIA

There's a state that's called out West—
California,
It is different from the rest, California;
Where they greet you with a smile
Make you feel that life's worth while
And there's beauty in each mile, in California

Where all nature seems in tune, in California,
In December as in June, in California;
While the peaks are white with snow
Rarest plants and flowers grow
In the valleys down below, in California

Where the sun shines every day, in California,
Though some mornings may be gray, in California;
But by noon it's warm and bright
And it's always cool at night
Where one sleeps and rests just right, in California.

Where it never rains at all, in California,
From the Spring until the Fall, in California;
Even then they sometimes pray
Before they get a rainy day
But "that's unusual" they say, in California

Where the crops are mighty fine, in California,
Fresh fruits bearing all the time, in California
Oranges, lemons, tangerines
Figs and dates and nectarines
And they always have fresh greens, in California.

They are coming out in droves, to California,
Building homes amongst the groves, in California;
And from census tabulation
There's no state in all the nation
Which increased in population, like California.

You may ask them why they came, to California,
They will all tell you the same, in California;
It's so much like Paradise
Heaven won't be a surprise
To one who finally dies, in California.

And they say that those who died, in California,
Were so thoroughly satisfied, in California;
Though on Golden harps they play
If they only had their say
They would come back right away, to California.

—J. A. Birmingham, Traveling Passenger Agent Pacific Electric Railway.

### STAREYES AND THE SKY BLUE KEY

**By Clara Peterson**

ONE morning the fairy Stareyes got up so early that breakfast wasn't ready so she put on her yellow feather cape and went for a fly through the sweet summer air.

Not far away was a little grey cottage with two windows that had been carefully mended and long long grass in the small front yard. Once the house had been painted white and the green blinds had glistened in the sunlight, but Stareyes didn't know that the house had ever been different. She liked it because there was a cherry tree close beside the back door and if she danced hard enough on one of the topmost tiny limbs all the red cherries on the branch would dance with her, swinging gaily back and forth.

This morning she made the cherries dance for half a minute or so, until she was very tired. Then below in the grass she saw a four leaved clover with a beautiful drop of dew resting in its heart. It made Stareyes so very thirsty that she floated down and began to sip daintily.

Suddenly Stareyes heard little voices whispering behind her. She drew the yellow cape hood over her curls and got ready to fly but ten warm chubby fingers had closed tightly around her body and the small girl who owned the fingers was calling,

"Bobbins, I caught a canary! I caught it! I caught it!"

Bobbins was there beside his sister in a second. The children looked alike in their faded overalls. They were four and five years old and both had short brown hair and black eyes. Those eyes were very wide just now for Bab had really caught something and it couldn't help but be a canary for yellow feathers were sticking out every way between her gentle fingers.

When Stareyes dared to open her eyes she found herself inside the little grey cottage. Bab had very carefully slipped the tiny yellow thing into the old willow birdcage which hung before the kitchen window. The cage was swinging on its spring and when the children had gone scrambling out to look for birdseed, Stareyes opened the cape hood a bit wider and looked around rather dizzily.

Oh, such a soap-sudsy place! There was a table with a red cloth, and an old old couch. There were three scrubbed chairs, a big one and a middle sized one and a little one. On the white wall was an old black clock with a picture of a windmill painted on it, and in the corner under the clock was a bench holding two washtubs. A small grey haired old lady bent over one of the tubs, swishing something through the suds, and Stareyes could see that she was smiling.

"She must be glad because the children caught me," pouted the fairy, and that was just why the grandmother did smile.

"We can't buy milk to feed a kitten but the children can find enough outdoors to feed this birdie," grandmother was thinking happily.

Bab came running with a leaking handful of hemp and millet seeds, and Bobbins tagged behind with a precious bit of apple, but the yellow bird had flown to the very top of the cage and sat there quietly on the tiny perch, pretending to have her head tucked under her wing.

"The birdie is afraid," said grandmother kindly. "Come, I will give you your porridge now and perhaps this afternoon the bird will be more acquainted. No doubt sometime she will even peck at your fingers for that is the way birds kiss."

All that long morning Stareyes watched the children who were very thoughtful and didn't bother her at all. Sometimes they turned the wringer and Bab did the dishes, but almost all the time they looked across the room and admired the pretty yellow feathers high in the cage.

At noon Bobbins began to yawn.

"I wish I could hold our bird just a teenty weenty minute," he said softly. "I think it has blue eyes—I'm sure I saw them—just as blue as your box, grandmother."

Grandmother sighed and wiped her hands on the towel.

"It is time for your bread and butter, children, and then napping time. I must carry my clothes back to the merchant's wife. Come, Bobbins, come, Bab. While you eat you shall hear again the story of my box which was as blue as skies in May."

Stareyes loved stories. She lifted her head and listened. The children smacked their lips over the bread and butter but grandmother sitting in the largest chair, talked on and on sorrowfully and forgot to eat her slice.

The sky blue wooden box had been given to grandmother when she was young, by her father. It was filled with golden coins but they were not to be touched until she really needed them. Grandmother had been frugal all her days and gotten along nicely but then four years ago Bab and Bobbins had been left alone and grandmother had been glad to take them to her house

The children had been very tiny then and Bobbins needed medicine. Milk had cost a great deal and grandmother had had to spend so much time with the babies that no hours were left in which she could tend her garden and prepare for winter. So grandmother had a great many times thought gratefully of the sky blue box locked securely in the attic cupboard and at last one night when her final penny was gone she had brought down the box. When the babies had gone to sleep she opened it and in the lamp light peeped in at the coins which meant clothes for the children and school and a home for them all. Then she locked the sky blue box with its sky blue key and put it on the shelf beside the clock and went smiling to bed.

In the morning the box was gone. The robber had left great footprints outside the window and grandmother rushed here and there frantically searching.

Now it chanced that the robber hadn't gone far when he was stopped by the king's men because he was slinking along as though he had done something wrong. He at once threw the sky blue box upon the ground and ran. The sky blue key fell out but no one noticed it. The king's men took the box to their ruler who shook it and smiled and then sent his messengers around the city to tell the people that his men had found a sky blue box which had gold clinking inside of it. The messengers shouted this down every street and called loudly that whoever owned the box should go to the palace and get it.

Then how badly the ruler felt, for tall men and short ones, fat and lean came trooping to the palace and each and every one said that he was quite sure that the sky blue box belonged to him. The king was so very angry at this that he said only one person should have the box, and that was the one who brought him the key to open it.

(Continued next week)

### NEW SALADS AND DESSERTS

**Quick, Easy, and the Best Ever**

Here is a bunch of brand new recipes for salads and desserts that will start you to the kitchen forthwith. See if they don't! Your Cultivator comes on Saturday? Well, here is your Sunday dinner dessert and salad. Both may be prepared today and set aside in your cooler or ice chest all ready to be brought on the table, dainty, cool and appetizing. All may be made without ice; none need a hot oven; a taste of one is sure to make you try another.

**Variety Salad**

Dissolve one package of cherry or strawberry Jell-O in a pint of boiling water. Cut off the end of three sweet green peppers and slip into each pepper one hard boiled egg. Fill in around the egg with the Jell-O (cooled) and place on ice to harden. Cut in slices with a sharp knife. Serve on a lettuce leaf with a red cross cut from pimento placed on center, which will be the yolk of the egg.

**Delicious Salad**

Drain juice from one medium sized can of white cherries, add two tablespoons of vinegar, and enough water to make one pint. Heat to boiling point and add one package of Lemon Jell-O. Alternate layers of Jell-O with layers of cherries, cold chicken (chopped fine) and chopped celery. Mould in individual moulds, or one large mould and slice.

**Spring Salad**

Dissolve a package of lemon Jell-O in a pint of boiling water and one tablespoon vinegar. Let cool until it begins to thicken and add to it one cup nutmeats, two cups chopped cucumbers which have been salted and drained, or one cup chopped celery. Mould and serve on crisp lettuce leaves with salad dressing.

**Cucumber Salad**

Grate enough cucumber to fill one cup. Add two tablespoons vinegar and pinch of salt. Dissolve a package of lemon Jell-O in one-half pint boiling water. When cool and it begins to thicken, add cucumber mixture, press through a sieve, add a few drops of green coloring and turn into a pan. When firm cut in squares. Serve on sliced cucumbers or lettuce. Fine with fish.

**Imperial Salad**

Drain juice from half a can of pineapple, add one tablespoon of vinegar and enough water to make a pint. Heat to boiling point and add one package of lemon Jell-O. Just as Jell-O

*Through for the day*

Your day's work is shortened and made easier when you have a good oil cookstove. Burn Pearl Oil for fuel and you no longer have coal and wood to carry or ashes to shovel out.

You work with a clean *controlled* heat that is concentrated directly under the utensil where it is needed—and your kitchen is kept cool and free from dirt.

Pearl Oil is the clean-burning, uniform, economical kerosene—refined and re-refined by a special process.

Dealers everywhere. Order by name—Pearl Oil.

## The Cultivator Patterns

**3973. Ladies Dress.**—Cut in 6 sizes: 34, 36, 38, 40, 42, and 44 inches bust measure. To make as illustrated requires 3⅜ yards of figured material 38 inches wide and 2⅝ yards of plain material 40 inches wide. The width at the foot is about 2 yards. Price 10c.

**3436. Boys' Blouse and Knickerbocker Trousers.**—Cut in 5 sizes: 6, 8, 10, 12 and 14 years. A 10 year size will require 1⅞ yards of 36 inch material for the Blouse and 1⅝ yards for the Knickerbockers. Price 10 cents.

**3971. Ladies' Apron Dress.**—Cut in 4 sizes: Small, 34-36, Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size requires 4 yards of 36 inch material. The width at the foot is about 2 yards. Price 10c.

**3646. Girl's Dress.**—Cut in 4 sizes: 4, 6, 8 and 10 years. An 8 year size requires 3¼ yards of 27 inch material. Price 10c.

**3965. Misses' Dresses.**—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 7⅞ yards of 36 inch material. The width at the foot is about 2 yards. Price 10c.

**3959. Girls' Dress.**—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size requires 2¾ yards of 40 inch material. Price 10c.

**3975. Ladies' House Dress.**—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 4½ yards of 40 inch material. The width at the foot is 2⅛ yards. Price 10c.

**3945. A Smart Top Garment.**—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires 3⅛ yards of 44 inch material for the jacket, and ⅞ yard for the cape. Price 10c.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Do not expect patterns under **Two Weeks** from date of order.

**CATALOGUE NOTICE**

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

**PATTERN DEPARTMENT**

**California Cultivator** **Los Angeles**

begins to set, add three slices of canned pineapple, cubed, one-half can Spanish pimentos, shredded, and one medium size cucumber, salted and cut fine. Mould in individual moulds or in one large mould and slice. Serve with cream salad dressing.

### Cherry Salad

Dissolve one package cherry Jell-O in one pint boiling water. As it begins to jely add four tablespoons candied ginger (cut fine) and two cups white cherries. Set to harden and serve with fruit salad dressing.

### Mocha Charlotte

Dissolve one package chocolate Jell-O in one and three-quarters cups of coffee (moderate strength) which has been strained through a fine cloth and heated to boiling point. Add the Jell-O slowly, stirring meanwhile, and add one-eighth teaspoon salt. When cold and beginning to thicken add one teaspoon vanilla and one-half cup heavy whipped cream. Mould in individual moulds. Serve with whipped or plain cream slightly sweetened, or custard dressing. Nutmeats and diced marshmallows may be added to it or used as a garnish.

### Snow Pudding

Dissolve a package of lemon Jell-O in a pint of boiling water. When cold and still liquid, before it begins to congeal, whip till it is of the consistency of whipped cream. Use a Dover or Ladd egg beater and keep the Jell-O cold while whipping by setting the dish in cracked ice, ice water or very cold water. A tin or aluminum quart measure is an ideal utensil for the purpose. Its depth prevents spattering, and tin and aluminum admit quickly the chill of the ice or cold water. Let stand till firm and then pile by spoons into sherbet glasses and serve with the following custard.

Place one pint of milk, one-half cup of sugar and grated rind of one lemon in top of double boiler, heat to scalding point and pour it over the well beaten yolks of two eggs. Return to double boiler and cook until the custard coats a spoon, being careful not to cook too long or it may curdle. Should it curdle, whip for a minute or so with an egg beater.

### Glorified Rice

Dissolve a package of lemon Jell-O in half a pint of boiling water. Add one-half pint of canned pineapple juice or any fruit juice. When a cold liquid, whip to the consistency of heavy whipped cream. Have two cups of cold boiled rice cooked dry. Fold the rice into the whipped Jell-O. Add one cup whipped cream, four tablespoons sugar, and salt to taste. Set in a cold place to harden.

### Nut Frappe

Dissolve a package of Jell-O, any flavor, in a pint of boiling water. Set aside to harden. Stir four tablespoons of sugar into one-half pint of whipped cream. When Jell-O is just on the point of setting, mix Jell-O and whipped cream by beating with a fork, and add one cup chopped nuts. Serve in sherbet glasses with fresh or preserved fruit, saving some of the nuts to use as a garnish.

### Pineapple Bavarian Cream

Dissolve a package of lemon Jell-O in half a pint of boiling water and add half a pint of juice from a can of pineapple. When cold and still liquid whip to consistency of whipped cream. Add a cup of the shredded pineapple. Pour into mold and set in a cold place to harden. Turn from mould and garnish with sliced pineapple, cherries or grapes.

### Raspberry Bavarian Cream

Wash one box of raspberries and sprinkle with four tablespoons of sugar. Dissolve a package of Raspberry Jell-O in three-fourths pint of boiling water and when cold and still liquid whip to consistency of whipped cream. Then fold in the raspberries and juice. Set in a cold place to harden. Serve with whipped cream and garnish with fresh berries. Use canned berries when fresh are out of season.

### TO PREVENT RUNNING

A little flour dusted over the top of cake before it is iced will prevent the icing from running off.

## OUR BABY COLUMN

### By Mrs. M. S. Sirdevan

Mother, do you take the time to enjoy your babies?

So few mothers seem to realize how short babyhood is until it is too late, and then you will hear them say, "I wish I had taken the time to enjoy my baby."

By enjoying, I do not mean entertaining. Develop imagination and a sense of humor when they are very young and they will play for hours by themselves, but they do want you to come to their tea parties and partake of the refreshments. Take a few minutes off and go and watch those little faces, and surely it is a memory that they will carry through life with them as well as you yourself. One hears many parents say that children are not worth all the trouble and pain they cause one in later years, but I cannot but feel that they didn't enjoy that babyhood to its fullest, for what could come to overshadow those wonderful and happy days when that little life depends upon you, its mother? If that memory isn't worth while, what is?

"I haven't the time," is another slogan used, but we can always find time to do the things we wish. Some parents expect their children to amuse themselves with nothing, but this is a 50-50 game, just as in every walk of life.

Girls are little mothers, and their dollies are babies to them, therefore they must be clothed and cared for, so sit down some afternoon and make a little outfit, even if there is other sewing that should be done, for there are not many years that they care for their dolls, but what happiness it brings at the time!

The baby loves to have you play "hide and seek," sing a song, recite some Mother Goose rhyme, or "ride a cock horse," and all this can be worked in while you are doing your housework, and it will keep you young and happy.

After reading this, many mothers will say that no doubt I have nothing else to do, but this is not so. I have two children, ages two and five, do all my housework, sewing and gardening, as well as outside interests, and yet I make the time to enjoy my babies, for I realize that it will not be long before the school and teacher will take my place, except in the daily routine of life.

## TO RENEW SUMMER HATS

### By Mary Ann Gray

To freshen up old summer hats so that they will do for another season's wear, the following methods are recommended: To bleach leghorns, milans or any white straw hats, mix the juice of 2 lemons with 4 teaspoons sulphur. Cover the hat thoroughly with this paste, let it dry in the sun, and after it is thoroughly dried, brush the dry powder off with a stiff brush and the hat will be as good as new.

Straw hats of all kinds may be freshened up and reshaped. Leghorns may be cleaned by rubbing with a cloth dampened in wood alcohol or by rubbing in white cornmeal which has been soaked in benzine. Allow this to dry and then brush it off. A leghorn hat that is very sunburnt or soiled can be changed to a soft yellow by immersing it in a strong solution of soda water for a few minutes. Remove from water and wipe, then press under a clean white cloth until dry.—College of South Dakota.

Her clothes hung all wrong,
Her form was too long;
When she came to a dress demonstration.
She heard what was said,
Then went home and read;
Now her clothes are the town's admiration.

## HOUSEHOLD QUERIES

### Lemon Juice for Canning Vegetables

Please tell me about using lemon juice in canning beans. I have been told that when you use a little you don't have to cook the beans so long to have them keep.—Subscriber, Lemoore.

The use of lemon juice in canning vegetables is fully explained in Mr. Cruess' article in July 1 issue. We feel particularly fortunate to have this very complete article by Mr. Cruess just at the beginning of the busy canning season when it will be most valuable.

### Pectin for Strawberry Jelly

We would like to know name of Los Angeles firm that makes pectin as we have a lot of small strawberries we want to make up into jellies and jams and they don't jelly by themselves.—Subscriber, Burbank.

Name of dealer has been sent by mail. We would suggest that housewives ask their grocers for this pectin. Probably they have it in stock, and if not, will be glad to get it for their customers. It seems to fill a long felt want.

### Poems by Guest

Is there a collection of poems by Edgar A. Guest? If so, who is the publisher and what is the price?—Subscriber, Valley Home.

There are several collections of Guest's poems published under titles; "Heap O'Living," "Over Here," "Path to Home," "When Day is Done," published by Reilly & Lee, Chicago. We cannot tell you the price.

### Home Made Candies

Please print a few recipes for home made candies.—Subscriber, Ripon.

Butter Scotch—To one cup brown sugar add one cup water, two level tablespoons butter. Put the sugar and water together and boil until it hardens when tried in cold water. Then add melted butter and pour into a greased pan and when cooled a little mark into squares with a knife. Do not stir when cooking.

Peppermints—Put a pound of white sugar and one and one-half teaspoons cream of tartar in a teacup of cold water. Stir until dissolved, then boil until a little of it, cooled in water, can be rolled into a ball with the fingers. Remove from the fire, allow it to cool a little, and beat with a spoon until it turns white. Add three drops of oil of peppermint, and mix well. If it hardens too quickly while beaten, set the bowl in a tin of boiling water. Make it into balls with the hands.

Divinity—(Part 1.) One cup sugar one-half cup water; boil until it threads. (Part 2.) Three cups sugar, one cup syrup (white), one-half cup water (cold). Boil until it forms a firm ball when put in cold water. (Part 3.) Beat whites of three eggs until very stiff, add Part 2, then add Part 1, and one full cup of chopped nuts (Brazil nuts and English walnuts mixed are very fine for this), and one teaspoon of vanilla and a pinch of salt. Beat until stiff. Put in buttered tins and cut into squares.

Plain Fudge—To a cup of milk allow quarter of a pound of chocolate cut in small pieces, a lump of butter the size of a walnut, and three cups of granulated sugar. Stir together constantly in a saucepan until they commence to boil. When a little dropped into cold water hardens it is ready to remove from the fire, add half a teaspoon of vanilla or lemon juice as flavoring. Beat the fudge until it is creamy, turn out on a buttered dish and score into squares before it hardens. Half brown sugar in place of all white makes a pleasing variety.

### How Long Are Skirts?

Please don't laugh—it's a very serious question. I am making up a new Conton crepe dress and I don't want to cut the skirt off too short if skirts are to be long this winter. Who knows?—Housekeeper.

Who does? The fashion writers have it straight from Paris that skirts are longer and still coming down, even ankle length being shown. Meanwhile eight inches from the ground is the popular thing over here. However, to be on the safe side, why not run a two inch tuck (by hand with long stitches) on the inside of your hem as your mother no doubt did in your little girl days? This can be easily let down and the stitches will not show.

## HINTS FROM HOUSEKEEPERS

### Candied Figs

You have not published as good a recipe for candied figs as the following. I have used this three years and send the figs for Christmas, if kept out of sight until December.

Five pounds figs (not over-ripe, with stems and skin on) one pound sugar, one-half cup water. Put two tablespoons baking soda over figs and pour on boiling water to cover. Let stand five minutes, then drain and rinse in cold water. Boil sugar and water, put figs in and boil one hour, covered. Remove cover and let stand over night. Boil uncovered one hour each day until juice is evaporated. Dry on plates in sun. Store in tin boxes without tight covers.—Subscriber, Bell.

## THERE YET

Clarence: "It's easy to see your people came from Ireland."

Terence: "An' that's where ye're wrong. They did nothin' of the kind."

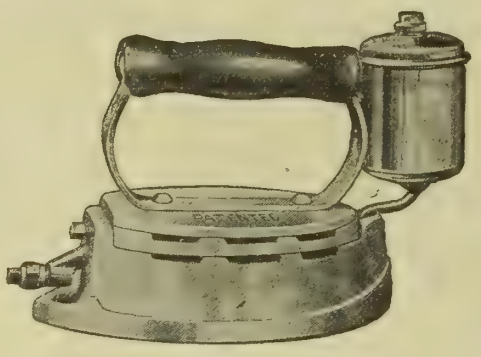
Clarence: "What? Didn't they come from Ireland? With that brogue?"

Terence: "They did not. They're there yet."—American Legion Weekly.

# Ironing Made Easy

BY THE

# "CRESCENT" Iron



Ironing with the old-fashioned stove-heated flat iron is hot, tiresome, time-wasting work.

Every home should have a "Crescent" Iron because it does better work—in less time—with less expense and less effort.

One "Crescent" Iron will do all the work of an entire set of the old-fashioned flat irons, including that of the laundry stove with its roaring fire and attendant discomfort and expense.

The "Crescent" saves all those weary steps to and fro between ironing board and stove—does more and better work, while the room remains cool and comfortable for the operator.

**If your dealer does not have, send $5.50 and your iron will come back parcel post prepaid. Fully guaranteed**

## THE COLEMAN LAMP CO.

**120 South Los Angeles Street, Los Angeles, Cal.**

# Ache?

Gombault's Balsam touches the spot. It quickly relieves pains and aches. ¶ At your druggist's or by parcel post. $1.50 per bottle. Lawrence-Williams Co., Cleveland, Ohio.

*The Imported Liniment*

**HEALING *and* ANTISEPTIC**

## Save 1-2 on Fuel

**CHEAPEST HEAT YOU CAN BUY**

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

# Planting a Walnut Grove

"THE California Walnut" is the title of a magnificent publication issued by the California Walnut Growers Association. This was intended to inform the trade as to the behavior of the California walnut at home. In order to give more complete appreciation of real walnut quality the difficulties confronting the walnut grower are referred to and cultural practices quite fully outlined. This book has a limited California circulation so we believe a few paragraphs will have interest for our readers. In describing the planting of a grove it says:

Importance is attached to the tree obtained for planting purposes. A stocky tree of from six to ten feet in height, of good diameter and a vigorous, healthy root system, should prove satisfactory. Such trees can be obtained from nurserymen at a cost of from $1.00 to $1.50 apiece. Good trees, even at a higher cost, prove the cheapest in the end. Trees are usually headed back to five or six feet at planting.

Trees of the present plantings range from 40 to 60 feet apart, but experience has proved that a distance of 60 feet between trees gives the best results. The walnut makes a vigorous growth, and if planted closer than 60 feet the trees will crowd when mature, the sunlight is excluded from a large portion of each tree, and the bearing surface materially reduced. This results in a reduction of crop. This contention is borne out by the fact that in closer plantings the outside trees bear appreciably more than those inside the grove where the sunlight is excluded. Actual comparisons by the field department of the California Walnut Growers Association between crops from close and distant plantings prove that though more distant plantings (60 by 60 feet for permanent trees) are more profitable in the long run, the returns from 60 foot permanent plantings are increased by planting the rows 60 feet apart and the trees 30 feet apart in the rows, with the intention of removing every other tree in the row when they begin to crowd. In localities where such varieties as the Eureka and Franquette do well, it is advisable to plant these less precocious varieties 60 by 60 feet with varieties such as the Placentia and Ehrhardt, which come into profitable bearing five or six years after planting, as fillers in the rows. When the proper time arrives the early bearing varieties can be removed, leaving a good 60 foot planting of the desired type. This practice is followed with very satisfactory results. Some growers even plant 30 by 30 feet with the intention of removing first every other row and later every other tree. This practice can only be recommended if the grower will have the moral courage to remove the trees at the proper time, or if the soil is strong enough to support the added trees profitably. In the majority of cases, the grower hasn't the moral courage to remove the trees when the time comes.

Interplanting with deciduous fruits is practiced in some sections, but usually to the disadvantage of the walnut but with possible profit to the grower.

# Keep Out Mediterranean Fruit Fly

Realizing the menace to California's fruit industry of the nearness of the Mediterranean fruit fly, the Southern California Canners Bureau writes:

"We do not know of anything worse that could happen to the growers of citrus fruits, deciduous fruits and grapes in California than that the Mediterraean Fruit Fly should gain access to the state. This fly exists in the Hawaiian Islands in very large numbers and does tremendous damage there every year. One fly's progeny amounts to around five million within a year, and each one of these has the ability to ruin a considerable quantity of fruit by laying eggs under the skin of the fruit, which later hatch into maggots and eventually become flies. Passengers from Honolulu continually attempt to smuggle in contraband fruits. Over 500 flies have been intercepted by inspectors at San Francisco in the past year and with the inauguration of passenger service between Honolulu and Los Angeles, it is essential that proper inspection service be established and maintained.

"We feel that this is a matter which concerns the whole state."

Accompanying this letter is a copy of the resolution adopted by its executive committee:

### The Resolution

"Whereas, it has come to our attention that unless adequate inspection service is quickly provided by the state of California at Los Angeles harbor, there is grave and serious danger that the Mediterranean fruit fly will gain access to California via the passenger steamers which we understand will very shortly begin service between Honolulu and Los Angeles, and

"Whereas, the Mediterranean fruit fly is the most dangerous and destructive pest known to citrus and deciduous fruits, and

"Whereas, the fruit growing industry is one of the largest, if not the largest, industry in California, the protection of which is vitally necessary to the continued prosperity of California, and

"Whereas, it is our understanding that there is at present no financial provision for adequate quarantine inspection service at Los Angeles harbor from this date until June 30, 1923, therefore, be it

"Resolved: that this organization, representing the fruit and vegetable canning industry of Southern California, being vitally interested in the continued well-being of the deciduous fruit growing industry, urgently requests officers of the state of California to make every effort possible to provide adequate inspection service at Los Angeles harbor in this emergency, and be it further

"Resolved: that a copy of this resolution be spread upon the minutes of this meeting and a copy sent to Honorable William D. Stephens, governor of the state of California, the state board of control, and G. H. Hecke, director of the state department of agriculture, with the request that these officers use every effort possible to make immediate provision for the protection of the great fruit growing industry of California as set out above."

## PROBLEMS OF THE CALIFORNIA WALNUT GROWER

The California walnut is becoming one of our most important orchard products. The one organization responsible for the prosperity which is coming to walnut growers is the California Walnut Growers Association. This is not only a packing and marketing organization but through its specialists it has made a study of walnut conditions and, further, looks after political and economic matters such as the tariff and other legislation. However, on the tariff fight it was deemed necessary to have an even more powerful organization, and the Walnut Protective League was formed. This is a cooperative organization of all American walnut growers and packers representing practically the entire American walnut industry. It handles only industrial problems which are not connected with marketing.

In its "Brief of Facts Relating to the American Walnut Industry" is much interesting information regarding the magnitude of the industry, investment in it, etc. From the Brief we quote:

"It will be observed that the American walnut grower must spend the best portion of a lifetime in bringing his grove into what should be a profitable bearing state. The walnut is a slow growing tree but eventually grows to a very large size. The spread of a full bearing tree is fully 50 feet and only 12 to 17 trees are planted to the acre. In this regard the walnut differs very much from the annual crops such as peanuts where the grower can rotate his crop from year to year or abandon the business without loss of any capital investment. The walnut grower necessarily makes a very heavy capital investment in the constant caring for his grove during the period between planting and profitable bearing. He cannot rotate his crop and can only abandon the business with a very heavy loss in his capital investment.

"The output of American grown walnuts for the past 12 years has been doubling on an average every four years, and indications are that this ratio of increased production will continue to hold for the next 10 or 12 years at least. We believe that this is a more rapid increase in production than can be shown on any other staple food. This rapid increase certainly proves that the point of market saturation will be reached within the next year or two. Then the American grown product will not only be available in sufficient quantity to supply the entire normal consumption of the United States but a large surplus will develop which will tend to make the competition for markets so keen among the American growers themselves, as to force prices down to low levels regardless of foreign competition. But, as the average foreigner has an advantage of at least 8 cents per pound in his production cost, he can continue to materially undersell the American producer regardless of the fact that a sufficient supply will be produced in the United States. In other words the foreigner can sell his walnuts in America at a profit when the domestic producer has to sell at a considerable loss."

---

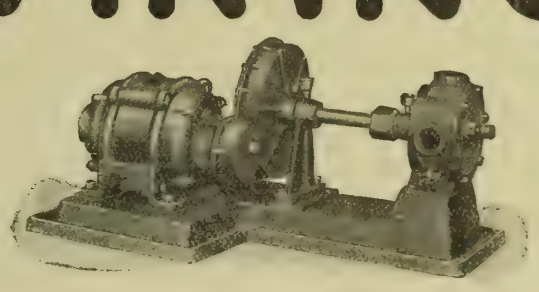
The cannery at Hilmar, Merced County, will operate this year.

## IRRIGATION OF SAN JOAQUIN VALLEY SHOWS FARM GROWTH

According to reports of the federal department of agriculture "The San Joaquin and its tributaries supply water to the larger part of the irrigated land in California. The low water discharge of these streams is all used, but very little provision for storing flood water has been made. State and private agencies are working on plans for large storage projects which will provide water for a large additional area.

"In the San Joaquin valley irrigation has brought the ground water near the surface and a great many wells and pumps have been put in, in some instances to furnish supplemental supply of water when the streams are low and in others, to provide the entire water supply." Acreage irrigated, classified by drainage basin, shows an increase of 125.5 per cent from 1902 to 1919. The total area irrigated has increased from 932,931 acres to 2,103,694 acres in this period. In 1920 the area enterprises were capable of irrigating stood at 3,248,919 acres and the area included in enterprises at 4,294,966 acres. San Joaquin river and tributaries have 269 diverting dams, 85 storage dams, 1,452 main ditches with a capacity of 55,628 second-feet and a length of 5,995 miles; there are 4,394 lateral ditches with a length of 6,904 miles; and 1,419 reservoirs with a capacity of 329,522 acre-feet. The number and length of ditches are well over half the total for all Pacific ocean streams excepting the Colorado and Columbia rivers.

VIKING



Electric Drive

(SELF-CONTAINED TYPE)

Because of the high efficiency of the Viking Rotary Pump, our self-contained units usually take a smaller motor than other electric pumps of the same capacity.

A decided saving in first cost of motor as well as in subsequent power consumption is thus secured.

Sizes: 5, 10, 20, 35, 90, 200, 300 and 450 gallons a minute. Built also for belt drive.

# Feeding Dairy Cows---No. 3

By E. J. Sturgis

## ADVANCED REGISTER TESTING

LIFE is restless. Old Mother Nature has decreed that nothing can stand still; either it advances up the scale or deteriorates. Accepting this law, mankind is endowed with the desire to get somewhere, to prove that it can do things and to be a success. This inalienable right enters into the everyday things of life and is present whether we know it or not. There is no branch of industry where the spirit of advancement is stronger nor where it reaps greater reward than in the dairy business. The man who takes things as they are and does not exert himself to make them better is never heard from and is continually on the edge of failure, if he is able to remain on the surface at all. The desire to do something worth while has been the factor which has developed the splendid dairy animals that we have and has brought great returns from increased production.

The satisfaction felt when an animal which one has bred, wins a blue ribbon in the show ring or makes a record for production that is talked about wherever brother breeders meet is so complete that it makes one forget all the hardships and worries of many a year.

### Value of A. R. Testing

Advanced Register testing has done more for the dairy industry than any other operation connected with it and yet it is really not one of the vital agencies of breeding. A cow may go through life and give just as much milk and make as much butter fat if not tested as if she is. Her offspring may be just as plentiful and as good as though she were tested every lactation period, but neither she nor her offspring can be as valuable. Advanced Register testing provides an authentic proof of an individual's greatness and gives the breeder a foundation on which to build. A. R. records tell us whether a herd bull is helping to better the breed by throwing daughters which are equal to or better than their dams and eliminates all elements of guess as to his value as well as their own. It is the duty of all owners of pure bred dairy cattle to give them A. R. records both for their own success and for the advancement of the breed. A summary of dairy cattle sales such as was published in these columns a year ago proves conclusively that testing pays through the increased valuation placed upon the animal and her offspring. The successful sale of most males is due to the records of the dams behind him and of his tested daughters, if he be fortunate enough to have them. One of the first questions a prospective buyer asks is, "What has his dam done."

Advanced Register testing need not be confined to the breeder with a well built plant and special equipment although these things tend to make the operation easier and perhaps the record a little bit higher. W. J. Higdon of Tulare made his first 30 pound record with the cow tied in a stall in his horse barn and I doubt whether any of the later records, of which there were many over 30 pounds, have ever caused quite the moment of happiness that this one did. Many other breeders have had a like experience.

### Be Ready to Test

One of the very important things when one desires to put a cow on test is to be prepared. Supervisors are not always at leisure, and it is better to write to Arthur Folger, University Farm, Davis a few weeks before you expect to make the test and tell him that you expect to need a supervisor at about a certain time, than to be worrying and fretting because he is unable to send you one at a moment's notice. A number of prospective high records have been spoiled because a supervisor was not available, and the breeder is often liable to blame the university rather than his own negligence when such is the case. It costs you nothing to help Mr. Folger anticipate his needs and it may be the means of saving a record for you.

### Various Tests Defined

The various breeds have their own rules and charges for Advanced Registry work, and complete details can be obtained from the secretaries of the breed associations or from Mr. Forger. The Ayrshire, Jersey and Guernsey Associations do not recognize anything but the longtime semi-official test, while the Holstein Association recognizes the seven and 30 day strictly official and 305 and 365 day semi-official tests. In the seven and 30 day tests the supervisor is present; weighs the milk and takes samples at each milking. In the semi-official the milk weights are kept by the milker, and once a month the supervisor is present for two days to weigh and test the milk. The milk weights for these days must be close to those of the period before and, since he is liable to drop in without warning at any time, they serve to provide an accurate record of what the cow is doing.

### Short Time Tests

For many years the short time test was the one generally in vogue with Holstein breeders and is still in use but is rapidly giving way to the long time tests which prove the persistency of production and are more valuable on that account. Short time tests are valuable in that they give an insight into what a cow is liable to do on year test and should not be given up entirely. They also provide a means of comparing an animal with her ancestors who were given nothing but the short tests.

### Conditioning Heifers

In my first article I explained the feeding of the heifer up to within a short time of calving. If this has been followed she should be in good condition to be made ready for her first test. As I do not like to have heifers in too high condition I treat them differently from cows. Ten weeks before calving the heifer should be brought in, and if she has been getting a little grain as I suggested there will be no trouble in getting her to eat the grain ration. If not it may take a few days before she will eat it with a relish. If it is possible to do so, feed her four times a day at the hours when she will be milked after calving. If this is not possible be sure to feed her three times a day. For the first six weeks I like to use a wide, light ration composed of 200 pounds coarse ground oats, 100 pounds bran, 100 pounds cornmeal and 50 pounds linseed oil meal. Feed not to exceed 10 pounds of this ration a day with plenty of good alfalfa. For the next three weeks feed the same quantity of equal parts of oats, bran, corn meal and linseed oil meal. The last week cut out the grain ration and feed only soaked beet pulp and alfalfa with six pounds of linseed oil meal a day. This brings the heifer up to calving not too fat and allows her to calve easily and clean readily.

### Feeding Dry Cows

Cows that are to be tested should have a rest of eight weeks before calving unless they have a tendency to keep fat easily and then six weeks is sufficient. A cow destined for a short time test should carry all the soft fat it is possible to crowd on to her. Feed as high as 20 pounds a day of equal parts of ground oats, bran, corn meal and linseed oil meal with plenty of alfalfa. She may also have wet beet pulp or green alfalfa or stock carrots or mangels. It is a good thing to vary the feed once a week by substituting a hot bran mash for the grain. This may also be given to the heifers. It serves to whet the appetite for the regular ration. The last seven days treat the cow as I have told you to do the heifers.

After calving give a hot bran mash and hot water. Do not leave the calf with the cow more than 12 hours as the milk will be extremely rich and full of fever from the high condition of the cow. Watch her carefully for milk fever as cows that are in high condition are very apt to have it and that advice applies to her entire lactation period as well as to the period directly after calving.

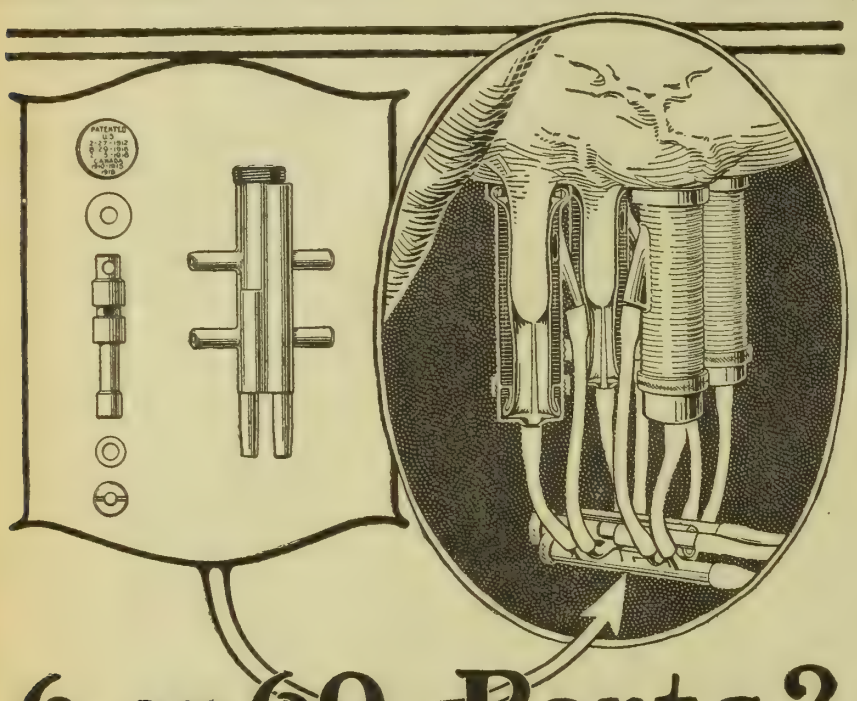
For the first three or four days feed not over 5 pounds of equal parts oats, bran and oil meal with about 10 pounds of wet beet pulp. Feed and milk four times a day and provide plenty of good alfalfa. It is imperative that the milker watch his cow closely and humor her whims. What suits one perfectly will not please another at all.

## FRESNO WILL HAVE A PORK DAY

Fresno County's first annual "Pork Day" will be held October 20. The event will consist of a sale and competition for prizes by the best hog raisers of Fresno County. It will be held at Kearney park farm.

Prizes are offered in four classes in which farm centers, individuals, and agricultural club members will compete. The fourth class will be for grand champion open to winners in the other three.

In the farm center competition prizes will be given for lots of 35 hogs, for lots of five and for individual hog. In individual competition the lots are similar. In the junior competition 10 prizes are offered for the 10 best individual hogs raised by members of the boys' agricultural clubs.



6 or 60 Parts?

There are just six parts to the De Laval Pulsator—only one of which moves, and it never requires oiling.

A pulsator is a very important part of a milking machine. It governs the periods of suction and squeeze or massage, which must be of correct frequency and exact and uniform in duration, in order that the cow's milk-producing organs may be stimulated to greatest activity and production. With the De Laval these periods are just right and absolutely uniform, which means that your cows are milked the same morning and night, year after year.

The De Laval Pulsator cannot be adjusted by the operator. It is thoroughly reliable, running years without attention. It is practically fool-proof.

Compare the De Laval with pulsators on other milkers which have from 30 to 60 or more parts, consisting of spring, screws, adjustable devices, etc., and you will realize its greater value. Then keep in mind that the same thought and care in designing the De Laval Pulsator have been put into the entire milker, all other parts being just as superior.

On thousands of dairy farms the De Laval Milker is proving that it is "The Better Way of Milking" — faster, better, cheaper, cleaner, and more profitable and pleasant than any other way. It soon pays for itself. Sold on easy terms.

Milker and Cream Separator

**You Should Not Buy a Bull Unless:**

You have seen his dam and know that she is the type you want his daughters to be.

Or you have seen a good picture of her with a close-up picture of her udder.

She is a big producer of milk with a high percentage of fat.

Our cows are the tops of all the big sales in the state for the past three years.

Practically all of them have high 7 day and yearly records. They hold 4 world's records. Our herd bull is **Sir Aaggie De Kol Mead**, whose five nearest dams average 1130.66 pounds of butter in a year testing over 4%.

You should have one of his sons out of a high record dam.

Call or write for our long-time, easy payment plan.

Lankershim, Cal. *Fred Hartsook* RANCH

Visitors always welcome.

*MR. FARMER:—*

You are contemplating the purchase of a service bull next year. Why not save 50 per cent of the purchase price by buying a registered Holstein bull calf now? Pay for him next year when he is ready for service.

Sons of SIR VEEMAN KORNDYKE PONTIAC, who has 27 A. R. O. daughters. and of BURR WALKER SADIE VALE, whose seven nearest dams average 29 lbs. of butter in 7 days, included in this offer. Call or write at once.

**BURR FARM** 26th and Downey Road, Los Angeles
RFD 2 Box 120

## Livestock News Notes

G. L. Strobeck and C. R. Grice of Santee have formed a combination and are putting a fine Guernsey herd on Edgemoor Farm. They have the two great bulls, Masterpiece of Edgemoor and Deanie's Marose of Apple Tree Point, to head the herd. They have recently purchased four heifers sired by Golden Hero of the Beauregard from F. B. Naylor. All of these heifers are making big records with their first calves.

Fred Hartsook has sold the young bull, McCloud Ormsby Imogen whose dams average over 930 pounds of butters for the year, to E. Paggi of San Fernando. Mr. Paggi has been using a son of Hartsook's former herd sire, Hazelwood Finderne Fayne, for a number of years and has purchased this young bull to use on his daughters. Mr. Paggi is one of the largest shippers to the Los Angeles market and he believes that no bull is too good to head his grade herd.

George Junior Republic is to have a new test barn which will be the present of the Rotary clubs of Redlands, San Bernardino, Colton, Pomona, Ontario and some of the other surrounding towns. Wonderful work is being done at the Republic with cows as well as with boys, and the herd is growing rapidly. They will have 16 to put on test in the next few months and the new barn will be needed.

A. J. Elliot, pure bred swine breeder of state wide repute, has sold his entire herd of Poland China hogs to H. G. Merritt, Jr., of the Tagus ranch. This famous herd of pure bred swine has taken many prizes at county and state fairs during the last several years and is considered one of the best herds on the Pacific coast.

L. D. Smith of Hydesville will hold a public sale of pure bred Guernseys at the Riverside fair grounds on August 4. The lot will be made up largely of cows in milk and bred heifers with two or three good young bulls. The sale will be held under the auspices of the Pacific Pure Bred Sales Company of which C. R. Thomas is manager.

J. A. Brown of Capitola, who owns one of the largest herds of pure bred Guernseys in the state says that inquiries for purebred Guernsey bulls to head grade herds in his section are becoming very frequent. He has sold two sons of Imp. Golden Hero of Beauregard within the past week, one to H. F. Potter of Salinas and the other to Jack Shannon of Arroyo Grande.

The Los Angeles County Farm reports sale of a yearling bull and a two year old to Bert Baker of Hill Post Office, San Diego County. The first is a son of Sir Aaggie Mead and the dam is Jessie Pietertje Fayne 2d. who was first prize senior yearling in the Portland International Exposition of 1919. The two year old, Romeo Pontiac of L. A. County, is a son of King Segis De Kol Mead 3rd, paternal brother to the state champion (Whittier Pontiac Netherland 4th, 1139 pounds butter in yearly test) from an 1100 pound yearly record granddaughter of King of the Pontiacs with an excellent show record. The dam of this bull is one of the foundation cows of the County Farm herd and made two records over 22 pounds butter in seven day test after passing 11 years of age.

A new edition of the History of Aberdeen Angus cattle in Great Britain and America has just been issued and may be had for the asking by writing to Charles Gray, 817 Exchange Avenue, Chicago. This book covers the development of the breed in the countries named from its first introduction to the present day and provides a lot of useful information on the "doddies."

The Southern California Fair has taken the stand that the ultimate end of the hog is the pork barrel and it is striving to foster the pork business by offering some very excellent prizes in the barrow classes. The barrow contest will consist of singles and pens under one year of age in each breed and a sweepstakes prize for the best pen all breeds competing. Another big feature will be the carcass contest which will be under the direction of the State Swine Breeders' Association. Preliminary plans for this contest are being made and it should be a good one. The entries will probably be limited to three from each breed all under 1 year. If you have a good barrow better get it entered. The pigs will be weighed the first day of the fair and then slaughtered. A competent judge of carcasses will then pass on their qualities. The percentage they dress out, marbling of the meat, amount of ham and bacon etc. will be the big factors in making the award. It is hoped to be able to exhibit the carcasses in a glass refrigerator during the fair and then sell them at an advanced price. The prizes in this class will be well worth going after.

Baywood Herd, Hollister, owned by The Lewis Company, San Jose, recently passed another tuberculin test without a reactor. This herd has gained a most enviable reputation for good health during several years of regular tuberculin testing.

Nancy Ormsby Skylark, a junior three year old owned by Maxwell Farms, Hollywood, recently made over 30 pounds butter in seven days. She is a daughter of the 40 pound cow Nancy Lucy Hengerveld, and sired by Sir Ormsby Skylark, sire of the former world's record cow, Duchess Skylark Ormsby. This gives "Nancy" the distinction of being the first 40 pound cow in California to produce a 30 pound daughter.

Rosamaines Bonita Ormsby, freshening at three years, one month, lately made 31.47 pounds butter in seven days in the good herd owned by Carl Ray, Lankershim. She is sired by King Pontiac Netherland Segis 3d, the noted proven son of Gerben Abbekerk Maid, and is out of the 32 pound four year old Stanislaus Princess Cleopatra. She is thus full sister to Rosamaines Pontiac Netherland, the sire now heading the herd at Pottenger Sanitorium, Monrovia. Stanislaus Princess Cleopatra was purchased in the recent E.R. Stalder dispersal by L. S. Pratt, Long Beach, and has dropped a fine bull calf by King Pontiac Netherland Segis 3d, thus another full brother to Mr. Ray's 31 pound heifer.

The Lewis Company, San Jose, recently sold sons of Ormsby Segis Marie Lad to Charles Woof and John Cannon, both of San Benito County. This high class son of Ormsby Segis Marie is siring a type of calves that appeals instantly to dairymen who appreciate the value of straight tops, deep bodies, and strong, rugged frames combined with quality.

Sir Veeman Korndyke Pontiac, noted sire of producing heifers, lately had a nice addition of five to his list of A. R. O. daughters in Frank M. Helm's big herd at Corcoran. Helm Tuebie Fayne Veeman, at two years, six months, made 23.19 pounds butter from 405.4 pounds milk in seven days

# horse profits

No. 4 of a Series — Published Monthly in the Interests of Better Horses and Better Harness — Louis Lichtenberger, Editor

## Your Horses Are Worthy of Good Harness

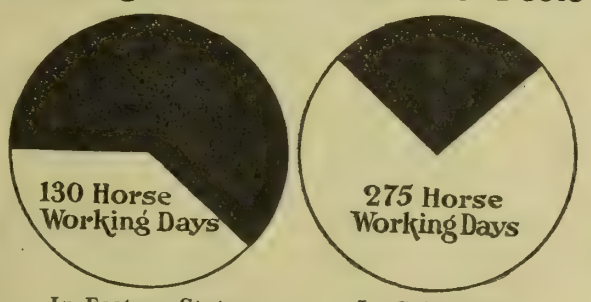
Horse comfort brings highest horse efficiency. Your good horses cannot deliver their maximum of power unless their comfort is given careful consideration. An ill-fitting, worn-out harness is a liability at best. Inspect your harness frequently. Take it to a reliable harness dealer and have him look it over. If you need new harness ask him to show you Superior Brand—the kind that has given satisfaction for more than a quarter-century.

Every whit of leather used in Superior Brand Harness must pass rigid tests for texture, tensile strength, pliableness and uniformity. It is built to meet California requirements.

### Various Types of Harness Used in California

Unusual as it may seem, different districts in California require certain types of harness. In the San Joaquin Valley, for instance, certain types of harness are used which are seldom seen in Southern California, and vice versa. There are approximately 100 types and sizes of Superior Harness from which to select.

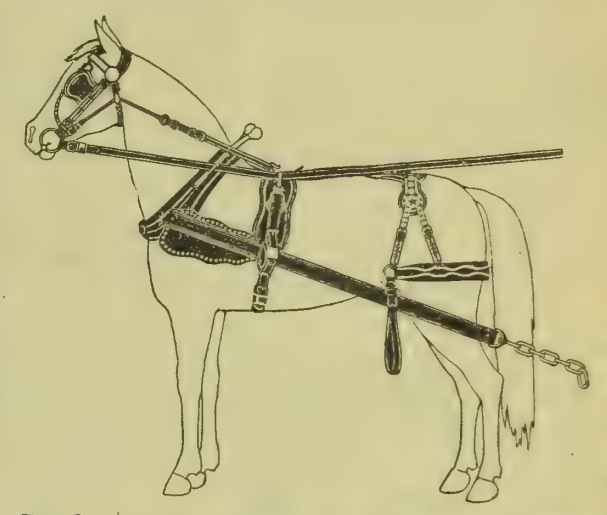
### Harness Used in California Undergoes Most Strenous Tests



In Eastern States — In California

It is poor economy to use any but the best of harness in California. Here harness is subjected to most severe use. The fact that there are 275 horse working days here means that harness must give double wear. Furthermore, the soil resistance is greater in California, subjecting harness to much greater strain and wear than elsewhere. Superior Brand Harness has the reserve strength to withstand this severe service.

**Write for Interesting Book Entitled "HORSE PROFITS"—Free**



### Style 150---Heavy Single Express Harness

A serviceable style for severe duty. The breeching is folded body with waved and raised layer, box loop hip strap tugs; heavy 3-ply traces, large fender; bridle with box loop cheeks, round winker brace and side reins; saddle with 5½-inch heavy harness leather skirts, Neat's leather pad and metal jockey plates. Price upon request.

The Home of Superior Harness

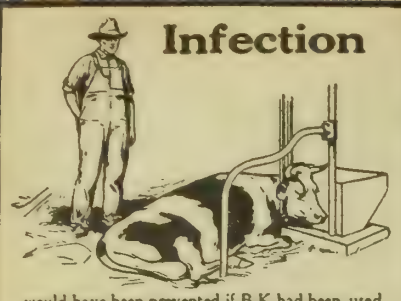
Los Angeles Street at Third — Los Angeles

MAKERS OF FINE HARNESS SINCE 1900

**Infection**



would have been prevented if B-K had been used shortly after this cow dropped that beautiful calf.

When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and failure to "get with calf." The afterbirth should be removed at once, without force, and the cow flushed out with a powerful antiseptic.

B-K is scientifically correct for this work. It quickly dissolves the adhesions and slimy matter and brings the afterbirth, kills the germs and foul odors, stops the discharge and straining. B-K is non-poisonous, healing and soothing.

If your dealer does not have B-K send us his name. Get a gallon—the standard farm package.

FREE "trial offer" and bulletins on contagious abortion—calf scours—hog raising.

B-K—in one bottle—helps you keep all these diseases out of your herd—and prevents big cash losses.

O. L. Hughes, Sales Manager
Sacramento Cal.

and 94.50 pounds butter from 1,850 pounds milk in 30 days; Helm Veeman Scioto Girl, at seven years, eleven months, made 21.44 pounds butter from 426.5 pounds milk in seven days; Helm Goshen Veeman, at three years, 11 days, made 22.84 pounds butter from 497.4 pounds milk; Helm Pontiac Bess Veeman, at two years, seven months, made 18.35 pounds butter from 354 pounds milk in seven days, and Helm Queen Veeman, at two years, 10 months, made 17.89 pounds butter from 361.1 pounds milk in seven days. All of these are first calf heifers and the five average 20.75 pounds butter in seven days. Herdsman Harry L. Redd has a large list of promising heifers moving up toward freshening time and more substantial records from this herd may be expected.

Pottenger Sanatorium, Monrovia has purchased from A. W. Morris & Sons Corporation, Woodland, a splendidly bred young bull to head its good registered herd. This young fellow is sired by Sir Aaggie De Kol Acme, the proven son of Asggie Acme of Riverside 2d, that made 1,331.50 pounds butter in 365 days on strictly official test, she a daughter of the 1,054 pound yearly record foundation cow, Aaggie Acme of Riverside 2d, is also the dam of Miss Aaggie Acme Burke, California's only 1,000 pound yearly record junior two year old, who, in turn, is dam of the $41,000 bull, King Korndyke Pontiac Acme, owned by Anita M. Baldwin, Santa Anita. The dam of the Pottenger sire is the great individual and producer, Flossie De Kol of Nevada that made at her last freshening 36.63 pounds butter from 681.2 pounds milk in seven days and is now on yearly test making a splendid record, having 536 pounds butter to her credit in her first four months.

Young daughters of King Korndyke Pontiac 20th continue to make excellent records as they calve for the first time in the herd of W. J. Higdon, Tulare. Among some of the latest are Dame Korndyke Pontiac Lilith with 19.01 pounds butter from 426.3 pounds milk in seven days at two years, 15 days, and now is milking 70 to 78 pounds per day; Ida Lotta Winifred Burke 2d, with 19.05 pounds butter from 483.9 pounds milk in seven days, now milking from 75 to 80 pounds per day; Lady Tricksy Korndyke Pontiac, with 17.37 pounds butter from 475.9 pounds milk in seven days, now milking 75 to 80 pounds per day; Winifred Hotaling Pontiac that made 25.04 pounds butter from 480.3 pounds milk in seven days at two years four months, has now been on yearly test 107 days and in that time has made 321.6 pounds butter from 7,907 pounds milk, making as high as 85 pounds per day of milk. Korndyke Creamcup, a junior three year old daughter of the same sire, made 26.64 pounds butter in seven days from 697.9 pounds milk and has since milked as high as 107 pounds in one day and is making a most promising start on another yearly record.

Report of the Kern County Cow Testing Association for June shows a total of 872 cows tested with an average of 696.2 pounds milk and 26.8 pounds butter fat. One hundred and two cows produced over 40 pounds of fat. The high cow was a mixed grade belonging to H. G. Grundt, Wasco, which made 67 pounds fat from 1425 pounds milk.

## PRESERVING GREEN FORAGE BY ELECTRICITY

Preliminary trials of preserving green forage by electricity have been conducted at the University of California farm by by F. W. Woll, professor of animal nutrition, and A. H. Hoffman, assistant professor of agricultural engineering. The method employed bids fair to become of considerable importance to stockmen in any country where cheap electric current is available.

Electrical current of medium voltage was conducted through layers of cut green forage that is tramped down solidly in insulated containers, something like modern silo structures, until a temperature of 140 degrees is reached in the mass. In the University of California experiments the current was conducted through green alfalfa and green foxtail, both cut at an early stage of growth and placed in three trial cement cylinders. One of the cylinders was opened one month after the treatment and the other two after two months. The contents were found to be in excellent condition with only a small amount of waste around the edge of the cover. It was of light brown color and had a very slight silage odor. The feed was eaten by cattle with apparent relish and without waste.

Further studies of this electrical method of forage preservation will be made with a view to determining its merits and practical value under the conditions present in this state.

## RAM SALE SATISFACTORY

Optimism prevailed at the annual ram sale of the California Wool Growers' Association, recently held at the University Farm, when nearly 300 head of sheep were sold at auction at an average of $42.26 per head. If this price is an indication it shows a healthy tone of the sheep business and a tendency toward better prices all around.

Eighty-three head of Hampshires brought an average of $52.05. Seventy-one Rambouillets were sold for an average of $41.31. One hundred and twenty-five Shropshires averaged $38.40. A Shropshire ram sold by Oeste Brothers of Davis and purchased by the Corriedale Sheep Company of Hollister topped the sale at $200.00. The University of California sold a Rambouillet ram for $100.00. Straloch Farms of Davis sold the top Hampshire ram at $157.50.

W. P. Wing was sales manager, and H. L. Hull was auctioneer.

## POISONING BY TREE TOBACCO

The following news item received by the California department of agriculture will be of interest to stockmen:

Early in November a drove of cattle reached the end of its day's drive at the Salinas River, tired and hungry, about midway between Bradley and San Ardo. Of course, anything green looked good to them, and they browsed on the green shoots of our tobacco. Four or five cows were dead by morning, and others were too weak to proceed on the day's journey. Others fell out during the day, and 21 was the total number of deaths at the last report. Local stockmen trace occasional deaths of cattle to eating this plant but consider that under ordinary conditions their stock become immune to injury from this source.

## NEW HOME FOR U. S. MOTORS

What is declared to be the largest electrical factory west of the Mississippi is being erected by the U. S. Electrical Manufacturing Company on a 5¼ acre tract on Slauson Avenue in Los Angeles.

The present factory is claimed to be the largest west of the Mississippi devoted exclusively to the manufacture of power motors and is the only electrical motor factory on the Pacific Coast. U. S. Motors are in operation in practically every kind of industrial plant on the Coast and are giving service to railroads, mines, irrigation projects, packing and canning industries, iron mines, ship building yards, garages and to innumerable manufacturers. The motors embody a number of exclusive, patented features and are reported to be giving unusually high degree of efficiency and durability. The range of motor sizes is from one-quarter horse power to 125 horse power. Among recent installations made by the factory was one amounting to $125,000 for irrigation service on land owned by the Southwest Cotton Company of Phoenix. Another group of U. S. Motors is supplying power to irrigation pumps on 72,000 acres of the James Ranch in the San Joaquin Valley. Several manufacturing firms in Los Angeles are each reported to have from 50 to 100 of these motors in operation on various machines.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Foxtail

I have a heifer that came fresh in February and has since been in apparently good health. She eats well and plays when turned out after milking but for the last ten days she spits out food in large chunks that has not been remasticated. She just swings her head around for a moment and throws out the food. She has access to alfalfa hay that has foxtail in it, which may have something to do with it. What is the remedy?—Subscriber, Oakdale.

The foxtail probably has something to do with the trouble. Examine the mouth carefully and you will probably find a place where the foxtail is working into the flesh. Remove it and wash out the place with alum water. Or the trouble may be due to a split or decayed tooth. The trouble is evidently all in the mouth. Hunt until you find it.

### Sore Shoulder

I have a horse that has a sore shoulder that I can not cure. Would like a remedy for it.—Subscriber, Winona.

Try wetting it with turpentine once a day. You did not say what part of the shoulder is sore nor whether there is a hard swelling under the sore or not. A fuller description gives us something to judge from. Sore shoulders are usually caused by ill fitting collars. Be sure that the collar is short enough so it nts close to the neck and just does not choke him. Too long or too wide collars cause most of the shoulder trouble.

The man who uses a scrub bull deserves a leather medal made out of the bull's hide.

The lime spreader is the soil's sugar bowl.

GUERNSEY COWS
produce practically all of the milk in this country which sells at a price considerably above the market price of ordinary milk. Guernsey grades produce the same kind of milk and they are in demand at good prices.

Every grade dairyman should own the best Guernsey bull he can buy. Write us if you want Guernseys.

## POTATO FIELD DAY

(Continued from Page 27)

crop but he had not tried it. With fall crop results were of the best, though it involves a summer's holdover in storage. The greening process he had not practiced but this season will try 1,000 sacks, first dipping them in corrosive sublimate, then putting them in trays and covering with cheesecloth to keep out the tuber moth. In straw curing he had placed them in low piles, in a cool place and covered with straw. Considerable rot occurred but he believed it would have occurred under any other treatment, so results were good. Planting whole tubers gave uneven stand but crop was good with those that grew. He further said he had experienced success in planting potatoes 48 hours after being dug, but ascribed it to the splendid condition of the potatoes when dug. Others gave fragmentary bits of experience and the visitors then dispersed.

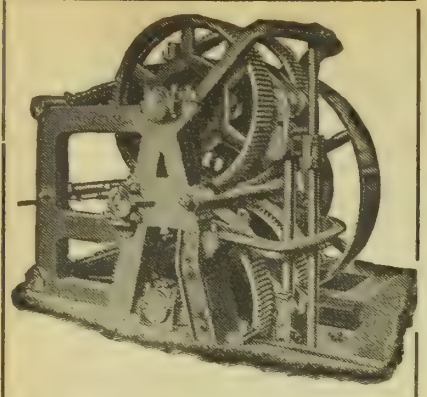
## POTATO FERTILIZER

A circular letter, of which the following is the main part, has of late been distributed by a fertilizer firm at meetings of potato growers.

The potato is not a self feeding plant; it cannot be made to support itself and do well. It must be fed, and fed well, to produce a yield that pays up to the average accomplishment of successful growers. The qualities desired are: regularity in shape, shallowness of eyes, general smoothness of skin, freedom from disease, clear color of flesh, fineness of texture, mealiness and dryness when cooked, delicacy of flavor. There are growers who by an exacting system of rotation and extra good farming do obtain profitable yields, but there are no record crops made by them such as are made by the use of a really high-grade potato fertilizer of proven effectiveness.

Sulphate of potash seems to have a direct action on the starch formation in potatoes, and potatoes with a higher starch content show better qualities, being dry and mealy, and are of a finer, smoother skin, more regular in shape and size and outweigh a potato not containing such a high starch content and are therefore in greater demand for the market. A potato fertilized with sulphate of potash seems to mature quicker and withstand to a greater extent the attacks of scab, blight, nematodes, which always appear to attack the unthriftier, weaker plants. Never starve your potato plants for if there is plenty of plant food available, even though conditions are unfavorable part of the growing season, the plants will be able when conditions are better and more favorable, to make up time and turn out a good crop after all. The growing season of potato plants is short, therefore, the fertilizer to do good must be rapid and made of materials all of which are immediately soluble in water and capable of being assimilated by the plant when it starts to growing.

A cow condemned by a state inspector as tuberculous was recently sold by a stock dealer who represented to the purchaser that she was healthy. He was fined $25 in justice's court.



THE POMONA

Duplex Plunger Deep Well Pumps

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

# Poultry Queries

Conducted by Jean A. Koethen

### Dropsy

One of my hens was so large behind that she dragged on the ground. When I killed her I found her full of water. What was the cause and is such a hen good for table use?—Subscriber.

Your hen had abdominal dropsy, originating perhaps in a mild case of peritonitis (inflammation of the abdominal membrane), obstruction of the circulation, or an anemic condition resulting from bad feeding and unsanitary surroundings. Dr. Salmon says: "Treatment of this condition is not profitable, but in special cases stimulating diet with considerable animal food, tonics and diuretics may be tried. Iodide of potassium or iodide of iron in doses of 1 grain is particularly indicated. Tapping with a hollow needle through the skin and muscles of the abdomen and allowing the fluid to escape is also recommended. It will usually be found more profitable to kill the bird." I should hardly consider such a fowl fit for the table.

### Sex of Geese

How can I tell the sex of geese?—A Subscriber, Simi.

The sex of geese is best distinguished by size and voice. Ganders are somewhat heavier and have harsher voices. It is the ganders that hiss when they are attacked or annoyed. It is said that among farmers in England it was customary to pick geese from ganders by putting them in a small yard with a dog. The ganders would stretch out their necks and hiss and the geese would get as far from the dog as possible. An expert can distinguish sex by a careful examination, but the amateur must depend on external characteristics.

### Sick Turkeys

Many of my turkeys are dying of liver trouble. They have plenty of fresh water and a large range of alfalfa.—Subscriber, Encanto.

You do not say how you have fed them. This liver trouble, which is really blackhead, is generally due to overfeeding or improper food, but sometimes when it appears in very young birds, comes from lack of sufficient warmth at night, or exposure to cold or dampness. The best thing you can do now is to let them get most of their living from the alfalfa field, with a little wheat at night. As you do not say how old they are I can not say exactly how to feed them. Chopped onion mixed with hard boiled egg and oat or wheat flakes is the regulation feed for little turkeys up to six weeks of age. After that they may have bran and grain, but onions should be fed till they are at least two months old. Cottage cheese and sour milk may be given freely. Poults that have alfalfa and sour milk need have little else after the first two or three weeks. Some turkey growers are finding that powdered ipecac in the mash, a teaspoon twice a week to 20 turkeys, prevents blackhead.

### Profit in Ducks

Is there any profit in raising ducks, and is there a good demand for them? What breed is best and how old should they be when they are put on a grain ration?—Subscriber, Wasco.

There is a fair profit in raising green ducks for market if they are raised early enough. Hatching for this purpose should begin in January, and the ducklings should be pushed as rapidly as possible till they are ten weeks old, when they should weigh six pounds or more. The Pekin is the only duck that grows rapidly enough to make a good green duck. Ducklings that are to be marketed as green ducks should never have anything but soft feed. Start them on bread crumbs or dry bran, and as soon as they have learned to eat well give a mash of 2 parts bran, 1 part middlings and a very little corn meal, moistened with water till crumbly, and with about 5 per cent sand or chick grit added. This may be fed at first five times a day but should soon be gradually diminished to three times a day. Never forget the sand, for the ducklings must have it to digest their food. The amount of corn meal in the mash may be gradually increased and a little beef scrap added after two weeks, though some duck raisers never feed it, and it is a good plan to mix cut up alfalfa or other greens in the mash until the ducklings have learned to eat without cutting. By the eighth week the mash may consist of equal parts bran, corn meal and middlings, with five per cent beef scrap, and always sand. The last two weeks some of the big duck men add a little oil meal for finishing. The point is, you see, to make the mash richer and more fattening as fast as the birds are able to digest it and to get them to market at the earliest possible moment. Duck prices are best in April. After the market is flooded with broilers they drop rapidly. The greatest demand is of course in cities. I am not sure that you would find green ducks profitable if you cannot ship them to a good market.

### Feeding Young Turkeys

I am certainly pleased with your paper. I am a novice in poultry lines and I find so many helpful hints and remedies. Please tell me the best feeds for young turkeys. At present I feed cracked wheat the first thing in the morning; in the middle of the forenoon hard boiled egg, chopped shell and all with onion and a little charcoal. They have sand, oyster shell, clean water and clabbered milk before them. At 4 p. m. I give egg and onion again. They are two weeks old and so far results have been good.—Subscriber, Oroville.

The best and safest feeds for young turkeys, from all I can learn, are alfalfa and sour milk or cottage cheese. They must have a little cereal food, of course, and perhaps the cracked wheat is as good as anything. The most successful feeders I know use the egg and onion but mix with it a good deal of alfalfa or other greens and a little cereal, preferably either flaked wheat or rolled oats. Fine grit should always be added. Miss Kate Warner of Hemet adds cottage cheese also. This mixture of egg, greens, cottage cheese and cereal is fed four or five times a day the first week and three times afterward, only a very little being given at a meal. After a week Miss Warner runs them on the alfalfa for part of every day. For successful turkey raising I believe an alfalfa field is absolutely essential. Another woman who has had good success feeds only sour milk and the turkey mash which is now prepared especially for little turkeys and feeds very little after the turkeys are able to run out on the alfalfa. Cracked wheat may be given separately as you give it or added to the softer feed to accustom the poults to it. I certainly wish you success with your venture. Remember it is not so much what you feed as how much that determines the fate of the little turkey.

### Sick Ducklings

My ducklings are dying of a disease no one seems to understand. First their eyes gum up, then when they are forced open the water squirts out. Then they begin to wheeze, find it hard to breathe and linger for several days, gradually getting worse and finally dying.—Subscriber, Bakersfield.

I am afraid you have not kept your ducklings warm enough at night, or perhaps they have gotten their down wet in their drinking water. If the down gets wet before it has changed to feathers they are apt to get cold. You might wash out their eyes with a boric acid solution (½ teaspoon boric acid to a cup of warm water) and grease with vaseline at night to keep them from sticking, but not much can be done for a sick duckling. The main thing is to keep them warm at night and cool when the sun is hot and not let them get wet till their feathers are grown.

### Castor Oil

What is the proper dose of castor oil for a White Leghorn hen?—Subscriber, Arroyo Grande.

From two to three teaspoons for an adult bird is Dr. Salmon's prescription. As the size of the bird should be considered two teaspoons is probably sufficient for a Leghorn.

### Roupy Chicks

Our last hatch of Leghorn chicks, hatched April 25, has not done well. They had a rather bad chilling at two weeks of age, and since then are dying. Eyes fill with white matter and close entirely and eye is pink outside. There is no odor and the chicks eat till they can no longer see.—Subscriber. Bakesfield.

I am afraid your chicks have roup of the eyes, due to the severe chilling they received. It is probably contagious among the younger birds, but the older and stronger are less susceptible. The eyes should be washed out morning and night with a boric acid solution, (½ teaspoon boric to a cup of warm water; let stand till dissolved). Use an eye dropper or a bit of absorbent cotton, and clean out all the secretion, then anoint with white vaseline. If there is no improvement in a few days try boric acid in a decoction of chamomile flowers, which your druggist can probably mix for you. Keep the chicks in a shady place and give all the range and green feed possible.

### Dry Mash Feeder

Please give me dimensions of a dry mash feeder to hold 1½ sacks of mash, to feed from both sides and be used inside or out.—Subscriber, Redlands.

You refer, I think, to the portable feeders which are used for young stock. To hold 1½ sacks of mash such a feeder should be 33 inches in each dimension. At the bottom on each side is a slit two or three inches wide through which the mash falls into a sort of open trough perhaps 4 inches wide and the length of the feeder. The whole is covered by a roof of sufficient slope and width to protect from rain. Most poultrymen feed their hens from a long trough or box built into the front of the house, and the portable feeder is used only for young stock that is not permanently in any one place.

### An Old Hen

How many years will a hen lay? We are prone to limit her usefulness to three or four or at the most six or seven years, but Mrs. Nebelung of

Anaheim has a Buff Leghorn that was 18 years old in February. "She looks like a pullet," writes Mrs. Nebelung, "is lively, has smooth legs, lays about six months every year and has only wanted to sit once in all that time. Can any one beat this?"

Some hen, sure. That is what we call a long distance layer. I wish Mrs. Nebelung had kept a record of the eggs laid by this remarkable hen.

### A Turkey Paradise

Sometimes I get a little blue about the future of the turkey industry. Turkeys are so hard to raise, so difficult to understand, and when you think you have mastered the secret they die and spoil everything. And so the following from a Caruthers man has done me a lot of good. He may not have put his finger on the crucial point of the situation but he is mighty near it:

"Last February I bought some poultry and moved it home. Then the operator at the electric substation a mile away left and I fell heir to his job. I moved the fowls again. I bought 1500 pounds of barley from a farmer, some oyster shells and charcoal, and I was keeping poultry. I decided I would try the extensive system. In this system you throw a pailful of barley into the chicken yard after they have gone to roost, and go round the next day and gather up the eggs. My turkeys have plenty of insects, green feed, water and a variety of grains the horses and cows waste out of their mangers, irrigating ditches full of water to drink from, piles of sand and gravel to pick grit from, oyster shell and charcoal before them all the time, a rye patch to harvest, and always green alfalfa. They run loose in a shady chickens' paradise. And it suits both me and the chickens. I don't like to fuss with them all the time. I would rather grow all I can for them and let them run around loose and pick it up, balancing their own ration. So far I haven't lost a young turkey. I feed only curds and chick feed. They rustle the green feed for themselves. My only trouble is that neither turkey nor chicken hens will sit. I have had to sell turkey eggs when I wanted to raise turkeys and have raised so far only a few young turkeys. I would like to know how many turkeys I can keep should I put the 10 acres at the substation into alfalfa. I would also like to visit some successful turkey grower and talk things over."

That is the natural way to raise turkeys. Birds that can run around and forage for themselves are lucky indeed. If Mr. W. is willing to keep his turkeys in part of the time and let them run on the alfalfa only at certain times I believe he can raise 500 turkeys on his ten acres. If he prefers to let them run all the time I doubt if he can raise more than 200. Turkeys are terrible eaters when they have unlimited access to growing greens. I might suggest that he visit Miss Kate Warner in the Fruitvale district at Hemet. Miss Warner has been raising turkeys longer than anybody I know, and she learned how from "Turkey" Myers, who led his flocks of turkeys over the Hemet hills for many years. He should also see Mrs. T. T. Middleton at Lankershim and Mrs. C. W. Young at Whittier. All these women are giving much thought to the problems of turkey growing and are quite determined to solve the mystery if mystery there be.

### CANDLE EGGS

Do you know how to tell the quality of an egg without breaking the shell? All you need is a pasteboard box with a hole 1 1-4 inches in diameter, a strong light such as is furnished by a lamp or an electric light bulb, a dark room, and the egg. When the egg is held close against the hole the strong light renders its contents visible and its quality is indicated by the appearance of the yolk, the white and the air space at the blunt end. By comparing the egg with charts furnished by the United States department of agriculture in Department Bulletin 51, it is possible to learn the exact condition of an egg before it is broken.

Testing eggs by candling, as it is called, may not only be used by the housewife in obtaining fresh eggs for her table but has also proved to be commercially practicable in preventing loss by separating for local consumption, eggs that, because of cracks, wetness, incipient spoilage, and other defects, are likely to spoil in shipment. Such eggs are suitable for immediate use but will not stand shipping.

Candling as near as posible to source of production will not only save transportation and storage charges for the farmers who wish to buy and sell on an accurate quality basis but will prevent the loss of a valuable food product. This method of conservation was tried out during the World War and the results have been so gratifying that many states have made it a permanent feature of their food control work.

Department Bulletin 51, which contains these charts, may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 40 cents.

### SOME HATCHING DON'TS

Don't leave the door of the incubator open while turning the eggs.

Don't fill lamp before turning the eggs.

Don't handle eggs with kerosene on your hands.

Don't leave the incubator without making sure the lamp flame is not too high or smoking.

Don't lay things on top of incubator, as they may interfere with regulating device.

Don't change regulating device after it has once been adjusted, unless toward the end of the hatch when the temperature has a tendency to climb.

Don't forget to fill and clean the lamp daily.—Colorado Agricultural College.

California poultry raisers will find valuable information in the new circular on artificial incubation just issued by the University of California agricultural experiment station. It gives detailed information on the selection of eggs for hatching, the proper location of the incubator, controlling temperature, moisture, and ventilation, the turning, cooling, and testing of the eggs, and how to care for the hatch. A copy of the circular may be obtained by addressing Director, Agricultural Experiment Station, Berkeley, and asking for Circular No. 233.

Chicks should not be fed for at least 48 hours after hatching. They can safely go 72 hours. Nature has taken care of the norishment during this period through the yolk of the egg, which is incorporated into the chick's body just before hatching. While this is being absorbed nature is preparing the delicate organs of digestion for the acceptance of outside feeds. Let your motto be "Feed little and often," and never completely satisfy the chick's hunger. This will insure against overfeeding and a consequent opportunity to loaf and get into mischief. Inactivity breeds such vices as toe picking, feather pulling, etc.

### TEHAMA COUNTY FARM BUREAU MEETINGS

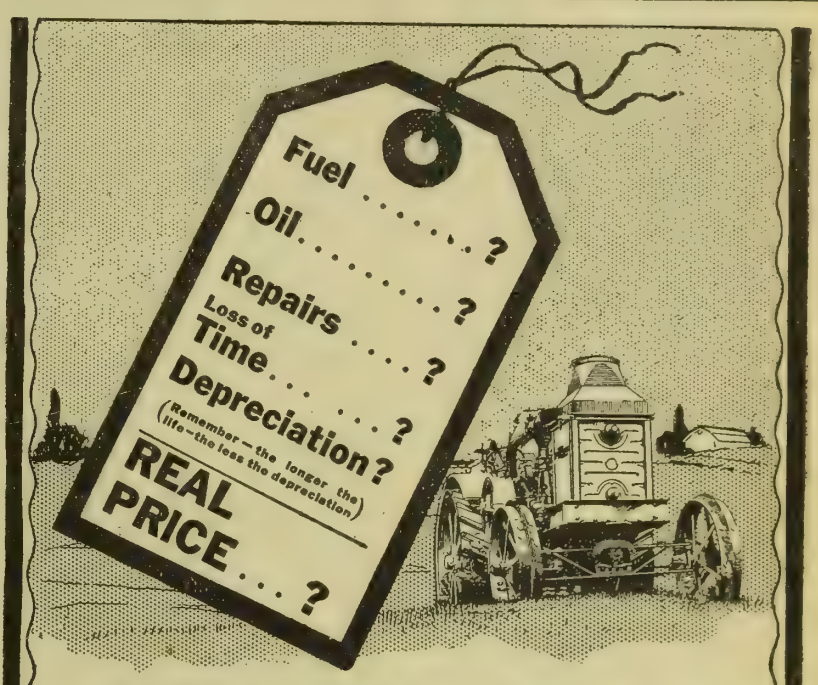
Johnston-Reeds Creek, July 10; Corning, 11; Dairyville, 12; Antelope, 13; Oak Park, 14; El Camino, 17; Red Bank, 19; Bend, 21; Richfield, 24; Stanford, 26; Liberal, 27; Flournoy, 28; Bowman, 29.

Farm home department meetings: Antelope, 11; Corning, 12; Oak Park, 13; Henleyville, 14; Vina, 18; Dairyville, 20; Capay, 21; County meeting (Red Bluff) 22; Bowman, 25; Squaw Hill, 26; Flournoy, 27; Red Bank-Reeds Creek, 28.

Says Sam: There's three kinds of folks; those who think things couldn't be worse; those who allow that after all things might be a lot worse; and those who roll up their sleeves and say, "Things can be bettered."

Shallow cultivated corn has beat deep cultivated corn about four bushels to the acre in Ohio tests.

Labor worketh a hardness upon sorrow.—Cicero.



# What Would the Real Price Tag Say?

*—if Tractors Were Priced According to Their Cost per Year of Service*

FARMERS everywhere face the same problem. Here is a "low price" tractor with flashy inducements, on one hand. Here is a "quality" machine—a long-life machine—at a reasonable price, on the other hand. Which tractor is the best investment—which costs the least in the end? Here is the answer:

Imagine tractors priced on the cost per year of service. Add up the cost of fuel, oil, repairs, loss of time, depreciation, etc., for one year on each tractor. Then compare these totals, which are the real prices. Many so-called "cheap" tractors would be exceedingly expensive. "Quality" tractors would prove their real economy.

## OILPULL

*The Cheapest Farm Power*

The OilPull saves at least 39% in fuel. Many California owners who burn stove tops and distillate enjoy even greater savings. Saves 50% in upkeep; averages 10 years and more of service, according to authentic investigations and comparisons. This is real economy.

Mail the coupon for further facts and a copy of our booklet, "Triple Heat Control."

Advance-Rumely Thresher Co., Inc.
17-19 Main St., San Francisco, Cal.

*Serviced Through 30 Branch Offices and Warehouses*

*The Advance-Rumely line includes kerosene tractors, steam engines, grain and rice threshers, alfalfa and clover hullers, husker-shredders and farm trucks.*

### LIVESTOCK

Los Angeles, July 3.—Weighed and delivered off cars without food or water.

Hogs (hard grain fed), 125 to 175 lbs., 10.75; 175 to 225 lbs., 11.00.

Cattle (on foot, gross weights): Steers, good, 5.00; bulls and stags, 9.25; calves, 125 to 150 lbs., 10.25; 150 to 225 lbs., 8.50.

Sheep: Ewes, 5.00@6.00; lambs, 11.00@12.00.

### POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, July 3, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Movement slow, market steady. Idahos, Russets, 3.00@3.50. Stocktons: Ordinary 2.00@2.50. New Stock: Best, locals, 70@80 per sug; small, 60@65; sk. cwt., 2.00@2.10.

Sweet Potatoes: Movement light, market steady. Arkansas: Nancy Halls, per bu., mostly 1.50@1.75.

Onions: Demand moderate, market steady. Quality fair. Coachella and Im- 1.50; yellow, 1.25. Stocktons: Reds, 1.40@1.60; yellows, 1.60@1.85.

Garlic: Mex. best, 10@12.

### VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, July 3, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Asparagus: Per lb.: Northern, 10@12.

Beans: Market dull. San Pedro Ky. Wonder 4.

Bunched Vegetables: Per doz. bunches: Turnips, beets and carrots, 35@40; radishes, parsley, 15; spinach, 20; parsnips, 35.

Cabbage: Market steady, quality ordinary. Field cr., best mostly 2.00@2.25.

Cucumbers: Local, No. 1 boxes, 50@55.

Celery: Movement moderate, market steady. Wide range in quality and prices; quality, generally ordinary. Locals, best, 6.50; poorer, 6.00@6.25.

Corn: Green, Imp., best, 35@40.

Eggplant: 16@18 lb. Coachella.

Lettuce: Market steady. Locals: 1.00@1.10 per cr.

Okra: Lb., best, small, 8@9; poorer, large, 5@6.

Peas: Best Northern, lb., mostly 5@6; few high as 10.

Peppers: Demand moderate, market firm. Bell, local, 25@30; chili, 15.

Rhubarb: Local, best, Crimson, 75@1.00; mostly, 75@85.

Squash: Market steady. Locals: Summer, lugs, 60; Italian, lugs, 75@85.

Tomatoes: 4 basket crates Imperial Valley: Best mostly, 1.25@1.50; poorer, 1.00. Coachella Valley: Mostly 1.50@1.75. San Pedro: lugs, 3.50@3.75. Texas: Crates, 1.25@1.35.

### FRESH FRUIT

These are actual prices obtained July 3 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc., as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apples: New White Astrachan, per lb., 7@8.

Apricots: Lb., Northern Royal, best, 3@4; poorer, 1@2; local, 2@4.

Blackberries: Cr., 2.00@2.50.

Cantaloupes: Imperial Valley: Standards, best, 1.25@1.40; poorer, 75@1.10; ponys, 1.00; flats, 50@60.

Cherries: Per lb.: Black Tartarians, ripe, best, 13@15; Bings, 18@20; Black Republicans, 15@16; Royal Annes, 14@16.

Currants: Cr., 2.50@2.65.

Figs: Northern, 27@32 lb.

Loganberries: 2.00@2.50 per cr.

Grapes: Coachella Valley. Thompson Seedless, 16 lb.

Peaches: Few fy., 8 lb.; mostly, 4@5; poorer low as 2.

Plums: Market oversupplied. Beautys mostly 3@4; overripe, low as 1½@2.

Raspberries: No. 1, 3.00@3.25.

Strawberries: No. 1, 3.00@3.50; No. 2, 2.00@2.75.

Watermelons: Imperials, Chilean, 1@2 per lb.; Klondike, 1@2.

### CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock July 3 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 3.50@4.00; market pack, 3.00@3.50; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Locals: Loose boxes, best, 2.50@2.75; poorer, 2.25; special brands, fancy, 6.75@7.50; choice, 5.50@5.75.

Oranges: Demand moderate, market steady. Navels, culls, 1.50 per field box; Valencias, special brands, 7.75@8.50.

### HONEY

Beekeepers report that the orange flow is over, but that bees are still gathering sage honey. The yield of orange honey is reported as fair to good, that of sage and buckwheat as good. Both orange and sage new crop are said to be of fine quality. Few sales are reported in carlots F.O.B. Usual terms from California points of extracted: Water white orange blossom and sage at 9½@10; fancy high as 10½ per lb. Light amber alfalfa, no sales reported, but shippers quoting 6@6½ per lb.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 20.00@26.00 |
| Barley | 18.00@22.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@22.00 |
| No. 1 Alfalfa | 15.00@17.00 |
| Standard Alfalfa | 12.00@14.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 20.00 |
| No. 1 Dairy | 15.00 |
| No. 1 Alfalfa | 12.00 |

### GRAIN

### POTATOES AND ONIONS

Sales to Retailers: Averages of actual prices obtained between 7:30 and 9 o'clock by San Francisco wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Potatoes: River, fancy, 1.60@2.00; Idaho netted gems, 2.00@2.25; off grades, lower; Salinas, 2.25@2.75 per cwt; new, 2@2¾ lb.

Onions: Green, 1.00@1.25 box; Stockton Red, 1.00@1.25 cwt.

Garlic: 2@3 per lb. for medium grades; poorer quality, less.

### VEGETABLES

Prices furnished by state department of agriculture, division of markets:

Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock, July 3, by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Artichokes: Per large cr., 4.00@6.00; extra large, 8.00.

Asparagus: 5@6 per lb.; white, 6@8 per lb.; graded, 9@11 per lb.

Beans: Ky. Wonder and wax, poor 2@5; Italian, 7@9.

Beets: Sack, 1.00@2.00.

Bunched Vegetables: Carrots, 60@75 per dozen; turnips, 55@60 per dozen; beets, 50@60 dozen; parsley, 30; radishes, 30 per dozen bunches.

Cabbage: River, 2 per lb.

Cauliflower: Doz., 75@1.00.

Carrots: 1.75@2.25.

Celery: So. Cal. 8.00.

Corn: New, doz., 25@75.

Cucumbers: Southern, 70@1.00 crate; 1.00@1.25 lug; English, 2.75@3.00 doz.

Eggplant: Southern, 10@15 per lb.

Lettuce: Local, 75@1.00 cr.; iced, 1.25.

Parsnips: 3.00@3.25 per sack.

Peas: Bay, 1½@3 lb.; Half-moon, 3½@4.

Peppers: Cal. Bells, 25@30; Chili, 15@25.

Rhubarb: Box, 1.50@1.75.

Spinach: Lb., 3@4.

Squash: Summer, lug, 50@1.00; Italian, cr., 45@65.

Tomatoes: Imperial, best, 1.25@1.50 cr.; Merced, 2.50@2.60 lug, 1.10@1.35 cr.; poor for less.

Turnips: 1.10@1.25 per sack.

### FRESH FRUIT

Apricots: Lb., 4@6; lug, 1.00@1.50; cr., 75@1.25.

Apples: New crop, green, lug, 1.00@1.50; fancy, box, 1.25@1.75.

Bananas: Hawaiian and eastern, 7½@8 per lb.

Blackberries: Dr., 30@35.

Cantaloupes: Imperial Valley, best standard crates, 1.00@1.25; pony crates, 75@1.00; Flats, 50@60; few higher. Soft, lower; Honey Dew and Casabas, flats, 1.00@1.25.

Cherries: Black, 1.25@1.50 per box; bulk, black, 6@10 per lb.; white, 8@10; Royal Anne, 10@13; Bings, 11@13.

Currants: Dr., 90@1.00.

Figs: Small box, 50@70.

Gooseberries: 10@15 lb.

Loganberries: Dr., 30@35.

Pineapples: 5.50@6.00 per doz.

Peaches: Cr. and basket, 50@1.00; lug, 75@1.50.

Cal. Pear Growers prices to canners ton: No. 1 Bartlett, 75; No. 2, $40.

Plums: 75@1.75 per cr.

Raspberries: 60@75 dr.

Strawberries: Watsonville and Salinas, cr., 90@1.20; local, 45@50 dr.

Watermelons: Imp., 2@2¼.

### CITRUS

Grapefruit: Southern Cal., fancy, spec. pack, 4.50@5.00; choice, 3.00@4.00.

Lemons: Spec. pack, 6.00@6.75; choice, 5.00@5.50; Lemonettes, 2.00@3.50.

Oranges: Valencias, fancy boxes, 126s, 9.50; 150s, 8.50; 176s, 8.00; 200s and smaller, 6.00@7.50; choice, 5.50@8.50; Culls, 3.50@5.00.

| Henderson Bush Limas | 9.00 |

### RICE

California Rice Growers Assoc. report: No. 1 Paddy, 2.77.

### HAY AND FEEDSTUFF

A. W. Scott Co. reports under date July 1:

Receipts past week, 725 tons as compared with 1022 previous week. The quality of the new crop so far received is very good. Export and coast-wise shipping has been very active during the week, but the demand is by no means heavy. Country trading continues light on account of harvesting. Baling is going on rapidly in many sections and heavy shipments should be headed towards central markets within the next couple of weeks. Alfalfa is moving slowly and with sales somewhat poor.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

| | Ton |

Corn: White Gyp., 1.95@2.00; Colored Milo, 1.90@1.95; Middlings, 42@44.

# Citrus Markets

Los Angeles, July 5, 1922.

Large sizes, good quality Valencias are bringing good prices, as high as $18.25 having been received in New York. Small sizes are doing better. Recent hot weather has increased the usual June drop. Groves which have been inadequately irrigated are showing excessive drop. Reliable estimate of the coming crop can not be made until end of the dropping period.

Lemon demand is very light and prices not satisfactory. Cool weather generally in the East has severely affected the market.

### AT THE AUCTIONS

**June 28**

New York: 26 or., 3 mix., 1 grapefruit, 5 lem. Val. 3.70@13.00, grapefruit 4.70@6.25, lem. 95@3.90.

## CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, July 3:
The Chicago market showed an increase in the number of cattle received during the past week compared with the previous week and an increase of 30c a hundred in price. The bulk of corn fed steers brought from 8.25 to 9.50 during the week. It is still impossible to ship California cattle east with profit, but the margin is increasing.

The San Francisco market holds steady, though rather quiet. Sales are reported at 7c f. o. b. ranch for good, fat, prime steers in Yolo, Solano, and San Benito Counties. 5½c f. o. b. ranch has been paid for good fat cows. San Francisco slaughterers agree that not more than 25% of the present slaughter is of prime fat cattle. Because of the shortage of prime stuff, half-fat cattle are being slaughtered.

The Los Angeles market also remains steady but shows a little more activity. Sales are reported in Coast counties at 7c for steers and 5½c for cows f. o. b. ranch, to Los Angeles buyers. Sales are reported at 6½c to 7c f. o. b. ranch for steers in Tulare County, and 5¼c to 5¾c for heifers.

Because of the exceedingly large supply of calves being rusned onto the market, it is highly desirable to hold back as many calves as possible for the next two weeks. This will unquestionably result in increased prices. Approximately 2500 head of cattle have been shipped to market outside of California during the month of June.

It is becoming more and more evident that there is a shortage of really prime cattle in the state. It is also evident that there is going to be an abundance of hay and stubble for holding and fattening cattle to killing quality later in the season. It appears that this will be a highly desirable thing to do, since adjoining states are also short of cattle and are planning to feed an unusual number this coming winter. Fed cattle should, therefore, be in good demand during the fall months.

A strong market is expected for the remainder of the year, and particularly during the next 2 months. We believe that the packers generally understand this to be the condition and are disposed to cooperate in giving the cowman fair prices. We are glad to note the sympathetic support of most of the large packers.—Marketing Committee: C. N. Hawkins, Owen Duffy, W. O. Blasingame, E. F. Forbes, Hub. Russell.

## CROP AND LIVESTOCK NOTES
June 15-30

By California Cooperative Crop Reporting Service

No serious damage was reported as a result of the warm weather the last half of June. Generally, it was of value by advancing the late season.

**Pasture and Livestock**

Dry feed in the valleys is generally in good condition but reported scarce in a few districts; however, enough stubble pasture is now available to supply the needs. Mountain and coastal regions report sufficient feed. Livestock continues to improve. The peak of the movement of early grass fed cattle has been passed, and netted fair returns.

**Grain**

The recent warm weather made harvesting conditions ideal. The quality and yield continues to be reported as very good. Destructive grain fires have occurred in both Sacramento and San Joaquin Valleys causing some losses.

**Fruit**

Fruit conditions are still very promising. No more grapes than usual were sunburned during the recent hot spell. A large crop of all varieties is indicated with the possible exception of Malagas and Thompson Seedless. Plums are moving generally in large quantities. The first boxes of Bartlett pears from Sacramento County have already been sent east. The cantaloupe season has passed the peak shipments with 649 cars moving on June 28. Reports of pear blight still continue and the production will be lowered slightly.

**Miscellaneous**

The labor situation is largely a local question, some districts reporting sufficient and others a scarcity, but at the present time the supply is equal to the demand. Beans are in good condition although the hot weather has caused serious wilting in a number of fields. The wire worm is reported in the San Fernando Valley and Garden Grove district in Orange County. Cotton shows good color and uniform stand, and while the season is a little late the condition of the crop is improving.

**California, Oregon and Washington**

Drouth in Oregon and Washington is cutting down the promise of all grain and hay crops. Throughout California grain harvest is general and good yields are promised. Temperatures have been high throughout the three states the latter half of the month with deficiency in rainfall in Oregon and Washington. The wheat harvest in California is in full swing and condition is considerably above the average, while in Oregon and Washington a decrease in condition is shown on account of drouth. The spring wheat crop in both Oregon and Washington will be short. The hay crop is also below average in the two northern states. Potatoes are generally reported in good condition. Fruit crops are somewhat late but making good progress and will fully maintain condition of June 15. The California prune crop is expected to be about equal that of last year, while a record crop is promised for Oregon.

## COMING EVENTS
(Corrections and Additions Requested.)

**Coachella Valley Grape Day**, Narbonne Ranch, July 11.
**Citrus Institute**, Pomona, July 14-15.
**California Rodeo**, Salinas, July 26-30.
**Yuba County Fair**, Arboga, August 18-20.
**Sonoma County Fair**, Santa Rosa, August 23-27.
**San Joaquin Valley Fair**, Stockton, August 24-30.
**California's Pageant of Progress and Industrial Exposition**, Los Angeles, August 26-September 9.
**Walnut Growers Field Day**, Santa Barbara, September 1-2.
**State Fair**, Sacramento, September 2-10.
**Grape Day**, Escondido, September 9.
**Tehama County Fair**, Red Bluff, September 11-17.
**Kern County Fair**, Bakersfield, September 12-19.
**Tulare County Fair**, Visalia, September 12-19.
**Colusa County Fair**, Colusa, September 14-17.
**Glenn County Fair**, Orland, September 18-23.
**Kings County Fair**, Hanford, September 19-23.
**Fresno County Fair**, Fresno, September 25-30.
**Shasta County Fair**, Anderson, September 28-30.
**Ventura County Fair**, Ventura, October 4-8.
**Butte County Fair**, Oroville, October 2-7.
**Pork Day**, Turlock, October 11.
**Los Angeles County Fair**, Pomona, October, 4-8.
**Southern California Fair**, Riverside, October 10-15.
**San Francisco Livestock Show**, October 18-22.
**California Horsebreeders Association**, Los Angeles, October 18-22.
**International Festival of Dates**, Indio, October 18-22.
**Pork Day**, Fresno, October 20.
**Imperial Valley Fair**, October 23-28.
**Valley Citrus Fair**, Visalia, November 26-December 2.
**Orange and Olive Festival**, Oroville, November 28-December 2.
**First National Walnut Exposition**, Santa Ana, December 4-9.

COAST AND GENERAL

**Southwest Washington Fair**, Chehalis-Centralia, August 28-September 2.
**Interstate Fair**, Spokane, Washington, September 4-9.
**Washington State Fair**, Yakima, September 18-23.
**Oregon State Fair**, Salem, September 25-30.
**Arizona State Fair**, Phoenix, October 30-November 3.
**Pacific International Livestock Show**, Portland, November 5-12.

## PRACTICAL TRAINING AT DAVIS

Young people of California who desire to increase their earning power but who do not care to pursue a regular college course, will be interested in the announcement of the Non-Degree Curriculum just issued by the University of California, College of Agriculture. Formerly known as the University Farm School Course, this provides a three year course for anyone 18 years of age or older, who has the equivalent of a grammar school education, and a two year course for high school graduates. One year of instruction may be had by young men who can spare only that amount of time. The courses give intensive, practical training in a number of different fields, much of the work being done in laboratory, field, shop and stable.

Positions open to men with such training include assistant herdsmen with various classes of purebred livestock, buttermaker in commercial creameries, cheesemaker in commercial cheese factories, ditch tender for canal companies, garden foremen to take charge of vegetable gardens for state institutions, tester for creamery and dairy plants, and tractor operators, service men and other positions connected with the farm machinery industry. Copies of the announcement describing courses offered and indicating probable expenses of the student may be secured by addressing the University Farm, Davis, California.

Experiments in control of water grass in rice fields are being made at the experiment station at Cortina, Glenn County.

## IRRIGATION MAP OF CALIFORNIA

A new irrigation map of California combining irrigation features with relief and a completely revised base has just been completed by the division of agricultural engineering of the U. S. department of agriculture with headquarters in Berkeley, cooperating with the state department of public works and the college of agriculture of the University of California, and is available without charge on application to any of these agencies. It is printed in nine different shades or colors on a scale of eight miles to the inch, and is issued mainly as separates embracing northern, central, and southern California.

The preparation of this map has involved the location and field platting of 5,999,300 acres of irrigated land out of a total in the state of 23,912,200 acres found to be irrigable to the extent water is available. The figures show California well in the lead of all of the western states both as to irrigated and irrigable area.

Besides giving information as to the location and extent of the irrigable and irrigated lands of the state, the map shows the location of the principal irrigation and power canals and conduits, existing reservoirs, rainfall and stream gaging stations, and existing hydro-electric developments.

The map is not alone of value to engineers, but is also of special interest to schools, chambers of commerce, boards of trade, irrigation districts, irrigation and water power companies, and all concerned in the development and disposal of agricultural lands. The relief shading, executed by John H. Renshawe of the U. S. geological survey, added to the land features shown, and the large scale of publications, gives the map a general educational value not approached by any map of the state previously isued.

## FEDERAL FUNDS HAVE HELPED AGRICULTURE

Dwight F. Davis, acting managing director of the War Finance Corporation, makes the following statement:

"Marked improvement in the condition of the agricultural industry and a better outlook for business generally is indicated by the April 1 reports received from the agencies of the War Finance Corporation throughout the country. Livestock producers and farmers generally are reported much more confident because of improved market and financial conditions. A strong demand for cattle has developed with buyers operating actively in the markets. Sheep and lamb markets have continued strong. Increased values for hogs, corn, and wheat at country points in the corn belt have encouraged the farmers and they are entering into their spring work with more zest.

"Good range conditions for the summer are already indicated in some states, and the drouth has been broken in the Southwestern wheat region. The growing feeling that it is possible to market sugar, corn, rice, and cotton on a paying basis has given a healthier tone to business.

"Financial conditions have greatly improved as a result both of improved markets and better arrangement for financing agricultural and livestock operations.

"Bank deposits have increased in many agricultural communities, and the country banks are generally in a stronger position than they have been for a long time.

"Best of all, confidence is returning and with it the trend of business is toward a restoration of more normal conditions all along the line.

"Up to March 31 the corporation has approved loans for agricultural purposes, to banks, $214,187,761.02, to cooperatives, $58,387,816.10; for export purposes, $50,250,120.03; total, $322,-825,697.15."

## U. S. AID TO CALIFORNIA IRRIGATORS

In the U. S. Department of Agriculture Clip Sheet we find:

"Ingenuity and resourcefulness are both working overtime for irrigation farmers in Southern California. Water for irrigation has generally a higher value there than in any other section of the West, and has become so scarce that in the absence of suitable reservoir sites where usual methods of storage might be put into effect the practice has grown up in recent years of spreading the flood waters over the gravelly soil where the streams emerge from the mountains. Where this is done the underground formations are such as to hold the water until it can be recovered by pumping during the irrigating season.

"Upon request of communities interested in the possibilities of this plan for their own development the bureau of public roads, United States department of agriculture, through its agricultural engineering division recently made an informal survey of what has been accomplished so far by such underground storage, finding that the method is now practiced on about a dozen streams in Southern California and that it has been effective in raising the water level in the wells through a series of years, notwithstanding the increasing demands made upon them by irrigation necessities. The department's representative recommended the practice of spreading water wherever conditions favor it, and several cities are now considering the adoption of the plan to help out domestic water supplies which will soon be insufficient if population increases at its present rate."

## WEEDS COST MONEY

Some weeds stock up ditches and drains, interfering with irrigation and drainage (cat-tails, Typha.)

Weeds increase the cost of cultivation. The United States department of agriculture in a series of experiments showed that the principal, and in some sections perhaps the only, value of cultivation in corn is to remove weeds.

Weeds increase the cost of harvesting the crop by requiring more time, more power, or more labor; and by increasing the wear and tear on machinery.

Weeds may delay the curing of hay or the drying of grain.

Weed seeds in grain cost the farmer freight on material for which he receives no returns, as well as the expense of separating.

Weeds may interfere with the regular system of rotation.—California Department of Agriculture.

## LIME TO CORRECT ACIDITY

In order to determine the relative effectiveness of lime in correcting soil acidity when it was introduced into the soil, and when used as a top dressing, the Rhode Island experiment station performed an experiment with timothy upon three plats. The manuring was the same in every instance. Upon one plat no lime was employed, upon another it was harrowed into the soil very thoroughly in the early autumn before the seed was sown, and upon the third it was weighed, left until the following spring, and then sowed broadcast. Where the lime was worked into the soil a good stand of timothy was secured. Only a very small stand was obtained where the top dressing of lime was used, and where it was omitted altogether timothy was entirely absent.

## THE "MAGIC ISLE"

Just off the coast of Los Angeles County lies the "Magic Isle" of Catalina, the vacation land incomparable. The humdrum cares of every day slip off one's shoulders somewhere in the blue waters of San Pedro channel and one steps ashore at Avalon into a land of romance and rest and beauty.

People who have traveled the world over and are qualified to make comparisons, give Catalina Island the preference over any resort in either hemisphere. "Go where you will, Catalina is incomparable," is the statement of world travelers, writers and sportsmen. One writer designated Catalina as "California's sample package de luxe." Boating and bathing at Avalon, with the incomparable fishing to be enjoyed in Catalina waters, submarine gardens seen through glass bottom boats, and the various land sports, including golf, tennis, horseback riding and auto trips, combine to give the Catalina visitor every form of diversion. And the most delightful part of it is that it is reached in two hours from the mainland.

The Catalina Island Company has issued a new illustrated folder, which will be sent free to inquirers from the Los Angeles office upon request.

## WEATHER REPORT

San Francisco, Cal., July 1, 1922.

| Stations | Rainfall: Week | Season | Norm. | Temp.: Max. | Min. |

# BIG POWER *in* EVERY DROP!

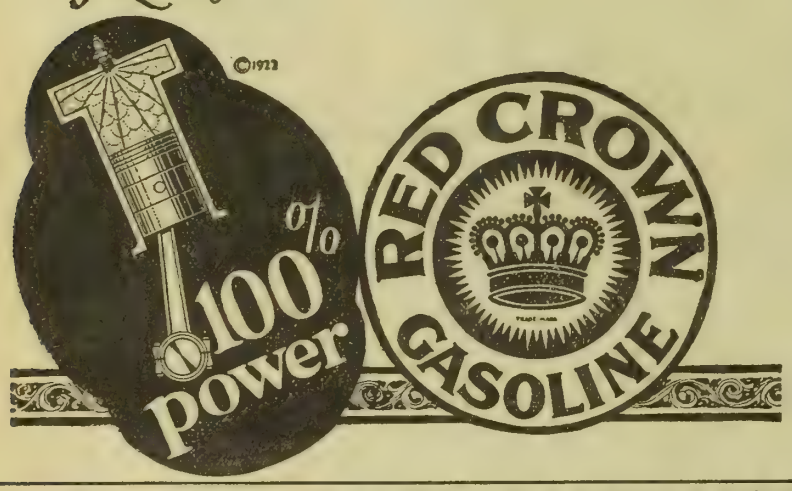
"Red Crown" meets the automotive engineer's demand for a motor fuel that will vaporize *rapidly* and *uniformly* in the carburetor, and explode *completely* in the cylinder. Every drop is 100% power.

Fill your tank with "Red Crown" and *nothing else,* and you won't have to bother with carburetor adjustments. You'll get prompt starting, better mileage, and a sweeter-running motor.

Fill at the Red Crown sign—at Service Stations, at garages, or other dealers.

STANDARD OIL COMPANY
(California)

*The Gasoline of Quality*



# UNIVERSAL BRAND SPRAYS

## Will Control Citrus Pests

You can depend upon Universal Brand Sprays. Your use of them in combating Red Spider, Citricola and Black Scale will convince you of their prompt effectiveness and marked economy.

What is more—Universal Brand Sprays stimulate the trees and increase their resistance to the climatic conditions thereby setting a good crop of fruit.

Right now is the time to use the following spray:

| | per 200 gal. tank. | |
|---|---|---|
| B. T. S.....15 lbs.<br>TRIUMPH.....1½ to 2½ gals.<br>K-SEEN GLUE.....1 lb.<br>(for citricola and black scale) | | B. T. S.....12 lbs.<br>TRIUMPH.....1 gal.<br>K-SEEN GLUE.....1 lb.<br>(for red spiders) |

(patented formulas)

**4 Gals. Lime Sulphur Solution can be substituted for the above B. T. S. dosage.**

Remember that Mr. Herbert, our assistant entomologist, is ready to inspect your trees and give specific advice relative to spraying. Call on him at our Los Angeles office.

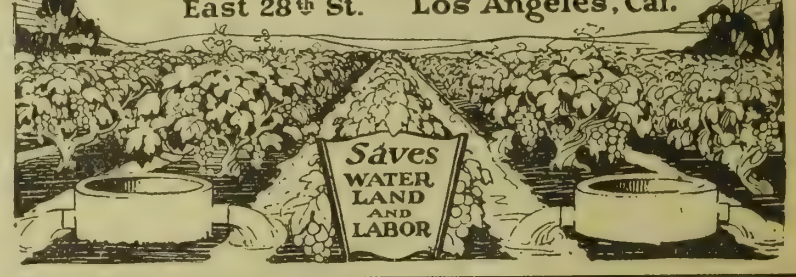
East 28th St. Los Angeles, Cal.



# THE AUTO-OILED AERMOTOR

## A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

*A year's supply of oil is sent with every Aermotor*

*Aermotor Towers are Towers of Strength*

*Write today for Circular.* **AERMOTOR CO.** Chicago Kansas City Des Moines Minneapolis Oakland

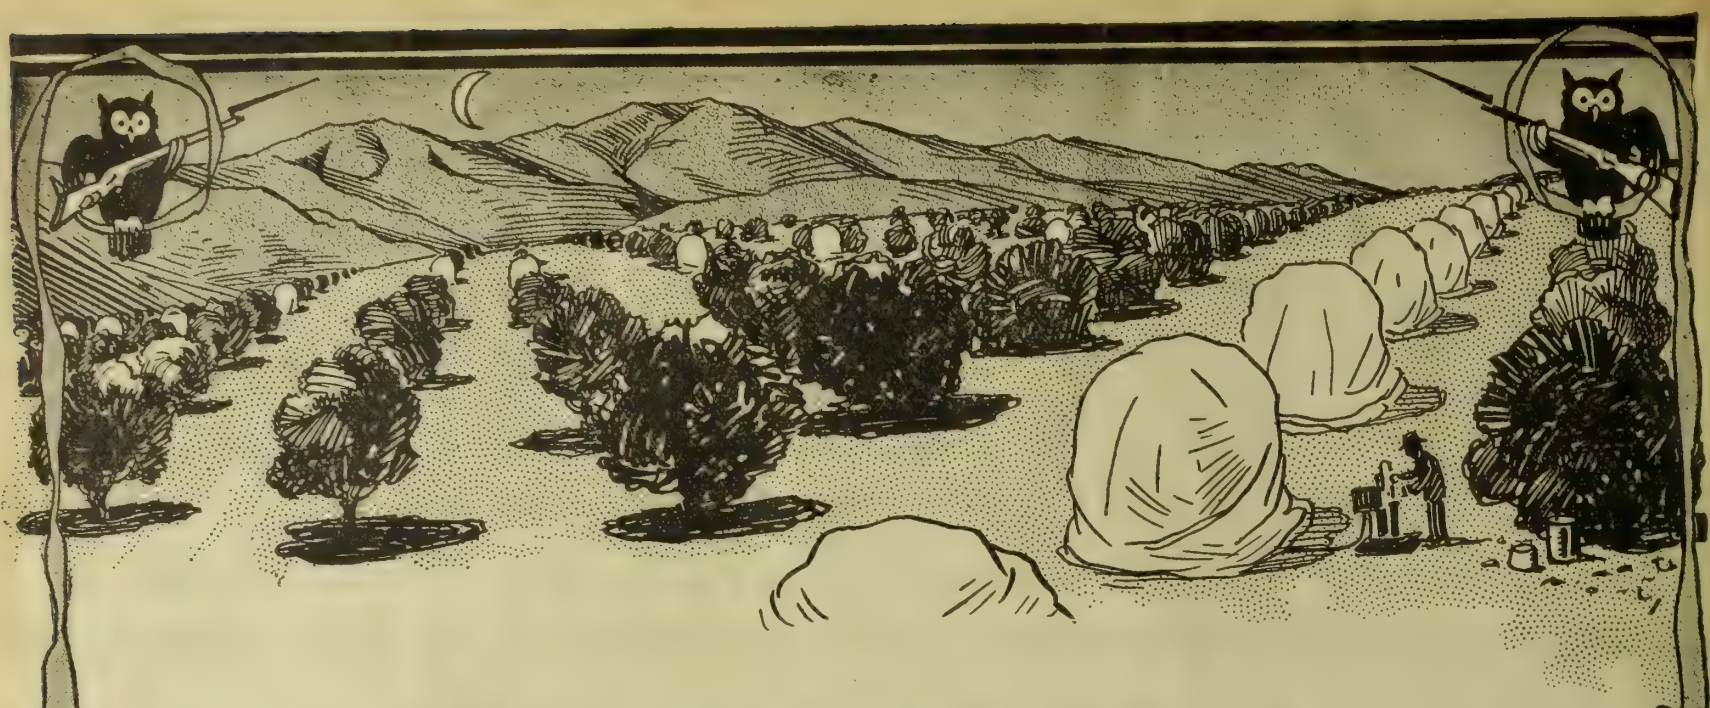
Fumigating on 2300-Acre Citrus Grove of Arlington Heights Fruit Co.



# FUMIGATION

Proper fumigation is the most effective, positive and economical method of protecting citrus trees from the ravages of scale.

Fumigation has no substitute. Where complete control of scale is expected, one thorough fumigation at the right time is sufficient and costs less than more frequent applications of less effective materials.

For the most effective Fumigation possible, we offer a combination that represents the result of years of experimenting and actual experience in the eradication of Citrus Scale, namely,

## Aero Brand Hydrocyanic Acid and Our Devices for Its Application

In Aero Brand Hydrocyanic Acid we are furnishing the highest quality product it is possible to produce—a scale-eliminating agent that cannot be excelled.

With the Jackson Fumigating Pump you can apply this acid with ease, accuracy, safety and with *perfect atomization* — thus insuring the maximum of results.

To make this combination still more efficient, we back it up with a field service that is not merely a repair department, but a real service-rendering organization.

Now is the time of the year when you should look after the protection of your trees. Do not experiment with untried or questionable methods, but be guided by the experience of thousands of progressive growers who have demonstrated by actual experience that our method is not only the most thorough and effective, but the most economical in the end.

# Black Scale and Fumigation

By H. J. Ryan, Horticultural Commissioner, Los Angeles County

DURING last winter's fumigation season 15 citrus growers associations and 26 commercial contractors operated 108 licensed fumigation outfits in Los Angeles County for the treatment of citrus orchards infested with scale insects. The largest cooperative outfit reported to the district horticultural inspectors over 542 orchards fumigated. In all 2,800 citrus orchards were fumigated in the county. This represents an expenditure of not less than $900,000 by the growers.

Due to a combination of conditions favorable to the natural increase of black scale since the heat wave of 1917, considerable dissatisfaction over fumigation results has been expressed by the growers for the past two seasons. A very direct and tangible benefit has resulted to the citrus industry through this expressed dissatisfaction in that it has stimulated the close attention and thought of the commercial manufacturers of fumigating materials and appliances and has unquestionably speeded inventions and competitive effort toward improved materials and appliances.

In certain districts a retrial of the pot and the cyanofumer method has been resorted to, thus affording an opportunity for comparisons of results between these systems and the liquid gas.

Through a system of annual inspection and grading of orchards according to individual conditions it has been possible to secure a comparison between different methods of treatment over a wide range of operation.

Unfortunately for the value of these comparisons, last winter's low temperatures resulted in a defoliation, or partial defoliation of groves over a considerable area and a consequent reduction of scale infestations in those localities because of exposure to the sun and wind. The owners of frost injured groves may secure some solace from the fact that the number of scale insects in their orchards has been temporarily reduced, thus affording a chance to hold the infestation in check by proper treatment.

### Scale Probably Abundant

Isaria fungus and the inevitable periodic increase of natural insect enemies have been very important factors in the scale situation this year. The crest of one of the periodic waves of scale invasion was reached last winter. Whether the present slump will be succeeded by a higher wave in 1923 will depend largely upon whether natural factors are more than usually favorable from now until the 1923 hatch is completed. Present indications are that these conditions will be favorable. Comparatively cool weather up to the present writing has allowed large numbers of newly hatched young to become established and the succulent new growth in many frost injured orchards will afford an ideal food supply and an excellent protection for the maturing insects.

### Don't Neglect Fumigation

Repeated experiences have shown that it is extremely difficult to clean up a grove which has been allowed to become badly infested, but a grove only lightly infested can, in almost every case, be kept in normal condition by annual fumigation.

The greatest influence on degree of scale infestation is artificial control; it is the only one which the grower can direct. Fumigation should not be neglected this year in any orchard in any district where black scale is a pest of importance.

It will not be safe to neglect fumigation in groves where the scale infestation has been reduced because of defoliation, for in such groves, under favorable weather conditions, the most severe infestations are likely to occur next season.

### Little Difference Between Pots and Cyanofumer

In comparing results of different methods of fumigation, it has been thought necessary to tabulate separately the defoliated and uninjured groves. Because of the necessity of making packing house inspections in the enforcement of the frosted fruit law, the district inspectors have been delayed in making their annual report this year. A complete tabulation will not be possible until August. Preliminary reports indicate that no practical difference in results between "liquid gas" and "cyanofumer" methods will be shown.

Less than 100 orchards in the county were reported as having been fumigated with pots; too few upon which to base comparisons with other methods.

A tabulation of partial reports shows that orchards uninjured by frost have been improved 15 per cent by fumigation with liquid gas and 14 per cent with the cyanofumer. Frost injured orchards fumigated with liquid gas show an improvement of 19 per cent as do also the same class of orchards fumigated with the cyanofumer.

# Is the Third Horseman Riding?

By A. L. Spellmeyer

WE have heard much of the Four Horsemen of the Apocalypse of Bible prophecy in the application to recent wars and world troubles. The first horseman is supposed to ride a white horse, wear a crown "and go forth conquering that he might conquer" and represent the recent World War that started with the kings. The second horseman rides a red horse and takes peace from the earth. Some people claim this is typical of the red movement of the Bolsheviki, that is the menace of the world's peace at present. The third horseman rides a black horse, while a voice calls "two pounds of wheat for a penny," and represents Famine.

Famine has visited Russia, China and many countries. Famine cannot injure any country with a food reserve unless it is of long continuance. We read of seven good years and seven lean years in ancient Egypt. They must have been unusual. The Chinese famine in that ancient country must have been unusual, an occurrence once in centuries. Famine in this nation with its rich land and plentiful water seems a remote and impossible occurrence, but the unexpected has happened, and a failure of a year's crop or of two years' crop is neither unknown nor impossible in our national experience. With a food reserve this is not a national calamity, but without that surplus food reserve it becomes a danger.

### No Surplus Food Reserve

Unprofitable agrarian production is today wiping out our food reserve. There is no question of that. The reason suggests another question: "In what line of farm production is there a profit at present prices?"

We do not believe the third horseman is riding with possible famine to us, but if our export surplus is wiped out other countries that depend upon that surplus may receive his visit. Shortage and oversupply may be but a matter of ten per cent in commodity supply. Range cattle with reserve feed pasturage live; without it they die in time of drouth. Lack of food supply is not worrying us yet as overproduction is what farmers in some lines are facing now as an apparent reason for low prices. Yet there is a question if it is overproduction or manipulation of the middle markets, as the end of each year rolls around with no unsold bulk remaining in the warehouses and each year shows less livestock numbers, less wool supply, and less reserve in a hundred commodities.

National inventories that have assured us of a vast surplus are open to grave doubt. We found the statistics of the 1920 census excessively optimistic in livestock numbers. The recently reported wool surplus was shown false, and wool has risen from ten to 50 cents. A noted research authority casts doubts upon the authenticity of the national wheat crop figures. Already we face a sheep shortage and we also are about to know a cattle shortage. Producers in many lines are advocating a limit of production in order to force a fair return where other methods have been without avail.

### Limiting Production

There is more than a threat in a limiting of country production unless the three to one city majority permits the country producers a living profit, for you can find rich land that is not being farmed in every county in this U. S. A., but production is still with good years more than adequate for present actual demand at times of the year in most of the food staples.

Generally farm producers are making an effort this year to raise crops and secure a living profit. If that profit doesn't come, next year will show the application of the limited production idea, and if the new crop returns on potatoes and cantaloupes and a few early food items indicate what will happen to the bulk of food production, there are breakers ahead.

The persistent robbery of both producers and consumers by middle marketers has been resumed of late with renewed vigor. General farm production remains unorganized. Those particular farm production efforts which have organized have achieved self protection, and when nature is kind, goodly profits. The citrus men, raisin men, peach and fig men and dairymen are organized and they have protected their industries with profit. But general livestock and farm production remains unorganized, and therefore impotent.

It is impossible to fight bad seasons and low markets combined. Singly a low market or a bad season can be weathered through, but a condition in which economic laws are outraged, with supply and demand inoperative, is destructive. The higher price for less production is what enables another effort; the lower price for greater production is what prevents surplus and waste.

Do you care to go into poultry with eggs at 27 cents that will cost you 30 cents to produce? Would you care to grow melons in Florida that bring you 7 cents and which sell at $1.50 in New York? Do you care to grow cantaloupes in Imperial and find you owe money on their shipping expense? Do you wish to grow olives on $150 per ton expense and sell for $60, or when you get a price find the heat has killed your bloom and you only have a half crop? Perhaps you would prefer to grow spuds and sell them at 50 cents a sack, as last year, or $1 a sack this year, after it cost you $35 an acre to plant and $3 an acre for each watering? Perhaps you would like to grow lemons and experience that frost which hit some of our frostless lemon and avocado districts this year, or grow oranges and have the fine little marble sized oranges drop from heat like some did last month.

We can't all be growing raisins and wine grapes and figs and walnuts and the things that appear profitable now for, outside of organized self protected products, what is high this year may be low next year.

Some people may prefer to branch out and join the range cattlemen who are presenting a $10 bill of loss with every yearling they sell on the present prices. Sheep are paying and to get into the sheep business now takes cash and the high price.

(Continued on Page 71.)

# Agricultural News Notes of the Pacific Coast

## Northern California

The Tioga road into Yosemite opened July 10.

Colusa County grain farmers report shortage in supply of harvest hands.

Supervisors of Placer County have decided to put in a home demonstration agent.

Managers of the Colusa County fair report many requests for space by prospective exhibitors.

In the two weeks ending June 17 over 70 dozen eggs were shipped from San Francisco to Hawaii.

Farm centers of Glenn County are making plans for their exhibits at the county fair to be held September 18-23.

Sonoma County has 36,717 acres planted to fruit trees. The heaviest acreage in one variety is 11,344 in prunes.

Records for one day's automobile travel in Yosemite national park were broken July 2 when 525 cars entered the park.

I. J. Condit, horticulturist of the Peach and Fig Growers Association, has been making a tour of fig orchards in Butte County.

H. J. Baade, who has been for several years farm advisor of Napa County, is planning to do a year's research work in Europe.

The first car of fruit shipped from Lincoln, Placer County, was a mixed lot of cherries, apricots and plums sent out on June 24.

The California Dairy Council has arranged a series of meetings in Sonoma and Marian Countits to advance interest in purebred dairy sires.

Ranchers at Madison, Yolo County, are asking Horticultural Commissioner Van Tassel to help them in their fight against yellow thistle.

Veterinarian R. A. Caldwell of Colusa County reports livestock in a healthy condition, range feed not quite so good as stockmen would wish.

John Stewart, San Joaquin County rancher, carries saddle horses by truck to his cattle ranges. He says he saves a lot of time and a lot of his horses' pep.

The dairy cattle show held at Valley Ford by dairymen of Sonoma and Marin Counties cleared between $200 and $300 which will be used to finance a second annual show next year.

Contract has been let by the state highway commission for grading and paving with reenforced concrete the section of highway between Upton and Shasta River in Siskiyou County.

The California State Automobile Association has two tow cars giving free service on the roads into Yosemite, one on the big Oak Flat road and one on the Chowchilla Mountain grade.

Sonoma County's exhibit at the state fair will feature each day some special product from some special section—Apple Day for Sebastopol, Pear Day for Sonoma, Prune Day for Healdsburg, Egg Day for Petaluma, etc.

The Placer County farm bureau has adopted the following wage schedule: Unskilled labor, 35c per hour; packing cherries, 20c per box; packing plums, 7c per box; packing peaches, 3c per box; packing pears, 8c per box; packing grapes, 5c per box, cleaned.

## Central California

Fresno grape growers report some injury to grapes from sunburn.

The Hume cannery at Turlock started on apricots the last of June.

Tulare County farm bureau picnic was held at Mooney Grove, Fourth of July.

Grain fires near Terra Loma, Merced County burned more than 10,000 acres.

San Benito County may hold a fair this fall, the farm bureau taking charge.

The Shasta County Producers Association has a refrigerating plant at Redding.

A series of nine poultry culling demonstrations was held this week in the Modesto district.

Dates for the second annual San Joaquin Citrus fair at Visalia, November 26-December 2.

Barley is now going into warehouses in the Salinas Valley and is of particularly fine quality.

Farm bureau meetings will be held in Stanislaus County at Wood Colony, July 17; Fairview, 21.

The Tulare cannery is not to be opened this summer. The Sanger plant will be open instead.

Salinas Valley lettuce growers are receiving $1 net per crate, lettuce averaging 300 crates to the acre.

A goat milk factory is to be established about Salinas. It will specialize on condensed baby and invalid food.

Ranchers about Hollister, San Benito County, are having some difficulty in securing sufficient labor to harvest their crops.

The California Peach and Fig Growers has secured headquarters in the Drodge Building at Fresno and will move about the first of August.

Five septic tank demonstrations were held in Monterey County last week under supervision of Prof. Belton of the University of California.

Irrigation districts concerned in the Pine Flat project have subscribed more than $10,000 to pay for expenses of investigation by the state engineer.

R. L. Nougaret, viticulturist of the state department of agriculture, is investigating reported occurrence of phylloxera in the Oakdale section of Stanislaus County.

Monterey County Pomona Grange held an all day session June 24 at Lake school in the Prunedale section. The next meeting will be held at Fort Romie, September 30.

The pest control bureau of the state department of agriculture is establishing a weed free area in Stanislaus County, the first to be established under the state law of 1921.

The Turlock Melon Growers Association has completed organization with J. H. Smith president and D. L. Wolfe secretary-treasurer. 1,000 cars have been signed with the association.

The Oakdale Almond Growers Exchange has elected as directors Harry J. Wood of Waterford, L. Langstroth of Riverbank, Wright Boddy, J. B. Stearns and S. A. Anderson of Oakdale. The exchange this year expects to handle 500 tons of almonds.

## Southern California

Redlands district is picking its largest apricot crop in years.

Pest Control school at Pomona, July 14, Citrus Institute, July 15.

The cantaloupe season for Palo Verde Valley started last week.

Six big canneries will handle the peach crop of the Pomona district this year.

Dates of the Los Angeles County fair at Pomona have been changed to October 17-21.

A number of Oxnard ranchers have become interested in the growing of winter vegetables.

Julian, San Diego County, celebrated on July 4 the completion of the state highway from Santa Ysabel.

Airplane patrol of Los Angeles County forests was started July 4 and will be continued through the summer.

The Banning cannery started on apricots July 1. The fruit is ripening up very fast now due to the hot weather.

Los Angeles County supervisors have passed an ordinance making it unlawful to pick yuccas on private or public property.

Because of the exigencies of the fruit canning season the railroad commission is granting temporary permits for auto truck service.

A modification of federal quarantine regulations allows entry into California of potatoes grown in the Imperial Valley of Lower California.

San Bernardino County farmers are fighting a pest of grasshoppers. Poison and burning of brush are recommended by the farm bureau to destroy the pests.

The Elsinore cannery of the California Growers Association is operating on first grade apricots only, shipping lower grades to other association canneries.

According to preliminary estimates of the California Lima Bean Growers Association there will be approximately 96,000 acres planted to Lima beans in the state and 13,000 to Baby Limas.

Vegetable growers of Ventura County, principally growers of cabbage, lettuce and cauliflower, are planning a permanent marketing organization. F. M. Bigelow of the state bureau of markets has been assisting them.

A tri-counties meeting, (Riverside, San Bernardino and Orange) was held at Corona yesterday to hear report of Mayor Evans of Riverside on his trip to Washington in the interest of the Boulder canyon dam project.

Water from the big break in the Palo Verde levee is receding and now stands only a foot deep at Hauser's Bend. Since the withdrawal of objections by Arizona to the plans of the levee board to straighten the river a crew of men is blasting out the new channel.

Representatives of the farm bureaus of Los Angeles, Orange, San Bernardino, Riverside, San Diego, and Ventura Counties met at Ventura June 24, and talked good roads. A resolution was forwarded to the state supervisors association urging legislation prohibiting loads in excess of 22,000 pounds on state highways.

## The Coast and General

Farmers in northern Arizona are investigating possibilities of growing head lettuce.

Texas expects to ship 2500 cars of tomatoes to middlewest and north central states.

The National Home Economics Association will hold sessions at Corvallis, Oregon, August 1-5.

Nineteen states have made application for special Holstein-Friesian calf club offers at state fairs this fall.

The Horse Heaven irrigation district of Washington has voted a $32,000,000 bond issue for the building of canals.

The Yakima Fruit Growers Association of Washington will this year sell its fruit through its own sales organization.

Thinning operations in the Wenatchee district of Washington have developed an estimate of about 14,000 cars of apples this season.

Alfalfa growers of Stevens County, Washington, are planning an observation tour of successfully producing fields in that county, July 27.

Truck growers of Yuma County, Arizona, are organized and will work with commodity organizations in Coconino, Maricopa and Pima Counties.

The Yakima warehouse of the Washington Cooperative Egg and Poultry Association, just established, is sending 400 cases of eggs weekly to Eastern markets.

The Aroostook, Maine, Potato Growers Association has decided to ship out all its potatoes this year in sacks. All members are prohibited from sending out any of their potatoes in bulk.

President Jewett of the Northwest Fruit Growers says that 12 to 15 per cent of the wheat produced in the United States this year will be marketed on a pooling basis, approximately one hundred million bushels.

Commercial production of 60,000 cars of early watermelons is estimated by the U. S. department of agriculture. Georgia will have something over 22,000 cars, Florida nearly 13,000, southern district of California, 3,000.

The sugar factory at Twin Falls, Idaho, will operate this fall. Live stock men say this means bringing into Southern Idaho hundreds of cattle and thousands of sheep to be fattened on beet pulp and will provide a market for their alfalfa hay.

National forest highway construction involivng an outlay of approximately $10,000,000 for 1,170 miles of road in 23 states has been approved by Secretary of Agriculture Wallace. Fifty miles will be built in California forests at an expenditure of $1,246,197.

A bill has been introluced into congress which would establish a federal standard for butter, making the minimum butter fat content 80 per cent and the maximum moisture content 16 per cent. These standards have the backing of the department of agriculture.

Farmers of Whatcom County, Washington, have adopted the following scale of harvest wages: Haying, $2; shocking, $3; box drivers, wheat haulers, straw haulers, hoe downs, header tenders, $3; sack sewers, combine drivers, loaders, $4; header punchers, push binder drivers, $5; pull binder drivers, $4; gas engineers, $6; steam engineers, $5; firemen, $4.

# Walnut Diseases

By V. F. Blanchard

DR H. S. Fawcett recently gave field lectures on walnut diseases, from which the following points were gleaned:

In maintaining a walnut grove in a high state of productivity it is essential that steps be taken to prevent disease attack and to treat it when it gains entrance. To understand the various diseases to which a walnut tree is subject it will be well to discuss them from the standpoint of those below ground and those above.

**Root Diseases**

There are three principal diseases which attack the roots, crown gall, oak root fungus, and foot rot. All are important and attempts should be made to prevent and to control them.

Crown gall occurs both on the roots and on the trunk. It is caused by a bacterium which gets into the cells, irritates them, resulting in the formation of a gall. These become enlarged and even girdle the roots and trunks. Decaying fungi get into them and kill the tissues, finally killing the tree.

The method of control is to cut out the galls and disinfect. Sometimes it is necessary to treat a second time. Treatment should be given before the galls progress very far.

Oak root fungus is a disease which attacks most kinds of trees. Infection takes place in the roots. Roots of a healthy tree coming in contact with roots of an affected tree will get the disease. It progresses into the larger roots and then into the trunk when death usually results. It lives between the bark and the cambium layers, forming white, ribbon like structures.

Treatment is rather unsatisfactory but it pays to try to control it. When a case is found, dig out the tree, removing all roots. Disinfect soil with carbon bisulphide, using 1½ ounces in hole 1½ feet deep and 1½ feet apart, covering up the holes again. Growers in citrus orchards practice digging a deep trench around the affected portion once a year to cut off roots which pass from one tree row to another. When the disease is found before it has progressed far it can be held in check by cutting out the affected bark and painting with disinfectant.

Foot rot is a disease which so far has only been found on Southern California Black walnut stock. It causes a dying back of the bark on the roots. It usually does not show up in the tops until the roots are practically destroyed, and then the leaves wilt suddenly. It is under investigation at the present time by the citrus experiment station. It seems to be correlated with wet soil and soil above the bud union. As soon as found each tree in the orchard should be inspected for the early stages of the disease. If it has not progressed too far it can be cut out and disinfected with Bordeaux paste. The soil sould be left open around the crown roots to dry out.

**Diseases Above Ground**

There are two principal infectious diseases which attack the trunks and limbs, heart rot decay and melaxuma. Both depend upon wounds to gain entrance. One of the greatest agencies for gaining entrance is sunburn. More harm comes to walnut trees from sunburn than any other one thing. If one were to examine the bark on the south side of most walnut trees that are not protected it will be seen that the outside layers of cells are dead while on the opposite side the cells are green at the surface. The top of a tree gets its moisture from roots on the same side, and roots obtain plant food from the top on the same side. If the trunk has the outside cells dead the sap flow to the roots is interfered with. Very often the bark splits and heart rot fungi gain entrance, finally injuring and destroying the tree by eating up the heart wood which is the tree foundation. It would be a paying investment for every walnut tree, no matter how large and old, to be painted with Bordeaux paste on trunk and main limbs. Bordeaux paste not only serves to protect against sunburn but prevents to a great extent the two diseases from gaining entrance.

Pruning wounds should be painted with a disinfectant and then with a wound dressing. It is better to apply a non air-tight disinfectant letting the wound dry out, and then follow with asphaltum paint within a day or two. That prevents the sealing in of moisture which would make conditions favorable for fungi growth.

Melaxuma diseases gain entrance in wounds and sunburn. When sunburned places become moist the fungus spores germinate and the fungus grows. After it becomes firmly established in the rotted bark it penetrates the living tissue, killing it as it progresses, and a black sap forms which flows copiously. It is quite severe sometimes and even girdles trunk and limbs. The most common trouble from it is that it makes favorable conditions for heart rot fungi to gain entrance. The method of treatment is to scrape away all of the dead bark to good tissue and disinfect. Bordeaux paste is quite satisfactory for it serves to prevent sunburn also.

# A Successful Five Acre Orchard

By M. E. Bemis

TO plant an orchard and make a home on unimproved land is generally considered a worth while achievement for a young man. When a man, who has reached the twilight years of life, starts out on an enterprise of this kind, it is somewhat more noteworthy, and when the dreams of such a man are realized, I always feel that it deserves something more than mere passing mention.

Just the other day I had the pleasure of meeting H. T. Crosby, and I met him where I like to meet farmers, that is to say, on his own farm, and literally "under his own vine and fig tree."

Mr. Crosby was formerly from Mississippi. He raised a large family, coming to the Salt River Valley some five or six years ago a widower and alone. About four years ago he purchased five acres in what is known as the Alhambra district. This land had been under cultivation but had not been intensively farmed and a good deal of work was necessary to make the land adaptable for fruit growing.

With some knowledge of deciduous fruits, and a willingness to work hard, which would have been commendable in a man much younger, Mr. Crosby set to work in the early spring of 1919. About one acre was set in grapes; the rest in apricots, plums and peaches. These trees were set 36 feet apart in order that the ground in between might be utilized to better advantage for the growing of other crops. In passing, I might as well say right here, that this to all appearance was successful. For two years the crop grown between the trees was cotton. One year four bales were made on the four acres. Last season he grew some sweet potatoes and some watermelons. This spring he has completed his original plan of filling in the spaces between the trees with fruit trees. These trees bore their first commercial crop last season—plums producing at the rate of 25 pounds per tree, peaches 15 pounds to the tree. Several varieties of apricots, peaches and plums were planted.

Last year's production gave an opportunity for studying production, vitality of trees, time of ripening, market prices of fruit and other factors that are of value to the producer of commercial fruit. The consequence is that the trees that have been planted in this season to fill out the orchard are mostly plums, the Santa Rosa variety being chosen as the most desirable deciduous fruit for the Salt River Valley of Arizona. The yield of this plum this year will probably be at least 100 pounds to the tree, even with careful thinning, which is apparent now will be necessary. A single limb of this variety, 50 inches long, was taken more or less at random and 74 plums were counted.

In the vineyard the Thompson Seedless grape seems to be with Mr. Crosby, as with other grape growers, the most popular. However, another variety known as the Isabelle, a late ripener, has proved a wonderful producer. Coming on the market at a time when there are no fresh grapes, prices are consequently good.

A somewhat unique system of utilizing all space available and preventing, to some extent, waste spaces which will grow weeds, Mr. Crosby laid out his head ditch with just a little additional space, permitting the planting of a row of apricot trees on the opposite side of the trees from the main orchard. Grapes have been set along the ditch through a part of the orchard.

The orchard is free from weeds, grass or other unsightly growth, showing conclusively that cultivation has been thorough.

Mr. Crosby was past the three score year milestone when he began his farming operations, but in spite of the fact that he has reached the time of life when many men retire from active work, I venture to say that he is more active than a great majority of men less than half his age. This achievement is something of which he is justly proud.

# Bee Locations and Honey Plants of California

By Henry Perkins

CALIFORNIA abounds in a very wide range of nectar producing flora both as to variety and seasonal distribution. The nectar flow extends from January to October or even later, beginning with the willow and eucalptus in January and terminating with the blue curl and sunflower in the late fall. The major honey plants upon which the beekeepers rely for a surplus are the orange which blooms in April, the sages from May till July, wild buckwheat from July till September, Lima beans in July and August, and alfalfa in the interior valleys from May till September. A large number of plants such as wild alfalfa, wild mustard, alfilaria and others too numerous to mention sandwich in throughout the entire season and although they seldom produce any surplus they serve as a source of pollen, also enough nectar for early and late stimulation for the bees, which is very important.

Fully half the honey produced in California is from wild flowers and therefore largely dependent upon adequate rainfall. A survey of the past 20 years will show that a full crop from this source need not be looked for oftener than one year in three or thereabout. The orange bloom, while not dependent upon rainfall, is very sensitive to other climatic conditions. It is seldom a total failure but often a partial one. The orange has a freakish way of yielding well in one locality and doing nothing in another perhaps only a few miles distant, due to a variety of causes. I should say that the orange flow is 50 per cent dependable. The alfalfa is the most reliable of all where it is far enough inland to escape the coast air. Imperial, Coachella and Yuma valleys, also Sacramento and San Joaquin valleys, are famous alfalfa honey sections. The wild buckwheat and sages are widely distributed throughout the coast range from the Mexican border to Santa Clara County. The higher elevations are as a rule the most dependable. The semi-arid sections on the desert side of the range frequently produce better than the coast side.

Now from the foregoing it is plain that there is no such thing as a bee location which combines all the desirable features and honey plants in one.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

☞ If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

A view of fumigation operations on one of California's big citrus groves is shown on this week's front cover. This grove belongs to the Arlington Heights Fruit Company and comprises some 2300 acres of citrus trees. No expense has been spared in keeping this orchard in ideal condition as will be noted from the illustrations. Nothing tends to improve the appearance of a grove as much as well cultivated ground and properly pruned trees. The trees in this orchard show by their vigor and productiveness that it pays to give citrus orchards the best of care. Mr. Alfred Crebbin is president and manager.

## AFIELD

In my last letter I did Ohio roads an injustice. I've nothing to take back as to the particular roads I described then, but there are others.

There is but little attention to highways by the state of Ohio. The auto license fee, which is entirely held by the state, is the only source of state road funds. The counties levy a tax and build some paved roads, but my experience has been largely on township constructed roads. This results in variety. All widths, heights and depths are experienced. Often a township is unable or unwilling to join in the construction, and a five mile interval of mud or dry humps gives a test to drivers nerves and to the cushions. Some pavements are on one side, some on other, some in center. Most are ten feet wide, some 12 or 16, a few 18 and occasionally curb to curb width. The 10 foot width is usually on one side and with no apron. That means that one must skid for it when two meet. Which one is determined by the side on which the pavement is laid.

When approaching a town this is usually on the right side of a road. The merchants insist that the farmer with a load of produce shall be encouraged to come to town with right of way in his favor. So in driving between towns 16 miles apart one is on the left for about eight miles, then suddenly is jumped to the right side of the road and has the right of way for the rest of the way in.

### Some are Wider

The other day I was driving from Mittawanga, a little resort on Lake Erie, some 75 miles south and west and to Freemont on the Sandusky River. There were a dozen types of highway and "nonhighway" construction. But between Norwalk and Fremont there is a brick pavement 18 feet wide of 4 by 4 brick on 4 inch concrete base with cushion of an inch or two of sand. There is practically no rounding of the surface, almost flat as the floor, and speedometers of the new Lincoln stuck at 50 miles and stayed there mile after mile.

Motor cops did not molest us though there are alleged to be certain small town officers who are ofttimes active, so "you'd better watch out" signs occasionally appear.

Then there is a fine strip of road between Ashland and Wooster. On the way via the Lincoln Highway one passes the memorial to Johnnie Appleseed. Johnnie, you know, was a wonderful character in the apple growing industry of Northern Ohio—was in the long ago when trails were still blazed an whitewood trees. But Johnnie Appleseed is worthy a longer story than I can write this week. The passing by his memorial was merely an incident of a drive to one of the finest of agricultural experiment stations in this U. S. A.

### Ohio State Agricultural Experiment Station

The Ohio state experiment station is in Wooster, Wayne County. It was formerly on the grounds of the state university at Columbus. The growth of the city and needs of the station made necessary removal to greater acreage and to a more representative farming section and the Wooster site of 700 acres was chosen. It is a wonderful piece of soil and is located in most beautiful surroundings, with view over a little valley with a city of 10,000, Wooster College and campus and rich little farms in its center, and with its surrounding hills rimmed with the forest primeval.

Ohio recognized the needs of agriculture even before the enactment of the National Experiment State Act (Hatch act) in 1887. In fact, beginning in 1883 an appropriation of $2,000 started the state work. This was soon increased, and by the time the Hatch act was in force Ohio was in position to take immediate advantage.

One of the fundamental problems of agriculture as stated by W. K. Greenbank, editor of the station publications, is: "Increased production which may be brought about by better methods of culture, by adding to the fertility of the soil, by improving the plants themselves and by controlling insect pests and plant diseases. Fertility experiments are planned and conducted. Agronomists cooperate as far as practicable with the botanists and entomologists in the study and control of crop diseases and insects."

Besides the fertility tests there are wonderfully illuminating plots showing the result of drainage. Drainage is proving most beneficial on naturally "well drained" soils. The lands of the station are rolling, and there is scarcely an acre which to the inexperienced eye appears to need under drainage. Yet two plots, one underdrained with tile, show most marked advantage in favor of the tiled plot planted to wheat.

Then in fertilization of oats there are a vast number of plots showing marked differences from application of nitrogen, phosphorus, or potassium, also all of the three elements in different proportions and infinite variety of combination by twos and, even application of single elements, and always the check plots where there is no fertilization. Unfortunately the rank growth of many of the plots, together with a three inch rain which had preceded my visit, had resulted in lodging some of the plots. These will be carefully handled by hand so as to preserve the fertilizer results.

But Californians have little interest in oats? Possibly, but they have great interest in fertilization, and I'm hoping Mr. Greenbank will yet give to Cultivator readers some of the results of the fertilization investigations. Mr. Greenbank gave up valuable hours to show me over the farm and the various experimental plots. Weeks would be required to give thorough study to work of the station. Of particular interest were the horticultural plots where half a thousand varieties of apples are in the testing. Japanese plums are trying Ohio climate, and some of them like it. California is not to have exclusive rights to plums. But the longest pole will knock them off.—C. B. M.

## THE OTHER HALF

Secretary Wallace says: "Marketing is the other half of agriculture." The time was when the wheat was taken to the mill and the grist taken home or a ham or side of pork exchanged with a neighbor for apples or a few yards of homespun.

California had to carry her "grist" so far over mountains and desert that it became necessary for neighbors to unite to fill a car or a ship. Especially was this true of fruits which produced in such abundance that marketing facilities failed woefully to meet the needs of the greatest productive industry of the state.

The far sightedness of California fruit growers and their prompt action in creating marketing forces were able to cope with the difficulties and bring success out of what at first appeared failure. Those of us who were of the first cooperators in '92 and '93 recall most vividly the faintness of heart which we concealed as best we could during those first few years of effort at cooperative marketing The faintness was overcome and while some growers fell by the wayside a sufficient number "stuck" and the greatest cooperative fruit marketing organization was builded. The East came West and went back and builded equally wisely.

Growers still ask each other: "which is best," and the more expert growers, the university specialists, the department people, the farm papers and others aid in the answer. We are still asking for the better and more economical way, but the one big question which the newcomer asks in considering an investment in any particular line of production is "are you people organized so that I may be sure of my market?" We think Mr. Wallace could have said more truly "Cooperative marketing is three-fourths of agriculture."

To meet the growing need of agriculture in marketing there must be more trained workers. Some of the marketers greatest difficulties today are caused by failures in business management. Inefficiency or lack of experience has resulted in financial loss to growers who have trusted their all to the organization. We fully believe there is but little if any loss from dishonesty, but "Inefficiency, thy sins are great!"

One of those who recognized present day needs of marketing was George Livingston, formerly chief of the bureau of markets. Mr. Livingston has now become associated with President J. R. Howard of the farm bureau and other rural uplift service people and there has been organized The American Institute of Agriculture with headquarters in Chicago. The work of the institute will be strictly educational and largely through correspondence courses.

## MORTGAGES INCREASE

The secretary of the federal department of agriculture has been directing the gathering of statistics as to mortgages on farming property and especially has been endeavoring to determine why they are increasing in the aggregate. The conclusion arrived at is that the increase is normal and because of the great increase in farm values.

A mortgage on the farm is not always a liability, at least not in the sense the overly careful sometimes consider it. In fact, we can imagine wherein a mortgage might be one of the strongest assets to the intelligent careful farmer. The greatest need of the farmer today is a working capital and when a mortgage is used to secure that working capital, and that capital made productive through purchase of fertilizers, of feeders, of better care of orchards, possibly of more irrigation water, it may readily be seen that the mortgage may result in profit rather than in loss or possibly total failure.

Amongst the findings of the department are the following:

"A very large per centage of farm mortgages is the result of land transfers, the mortgage, like tenancy, forming a rung in the agricultural ladder to farm ownership. The size of the mortgage naturally tends to bear a direct relationship to the purchase price of the farm. To the extent that farm mortgages are the result of investments in productive permanent improvements and equipment by existing farm owners, they evidence progress and not regression. In general the increase in farm mortgages during each decade since data were first gathered by the census has been most marked in sections which have made the greatest progress during that period. Even where improvements are paid for out of savings instead of with the proceeds of loans, the increased value and price of a farm is quite certain to result in a larger mortgage in case the farm is transferred to a new owner."

## AVOCADO FIELD DAY

By Ernest Braunton

THE southern half of California contains thousands of seedling avocados and there are many more well north of the median line. Guatemalan tops on Mexican trunks perished during the January freeze, hardier

Top Workig Avocado

Carter Barret inserting a ⅝ inch scion in the split trunk. Sprouts left on trunk to use surplus sap.

scions will now be used, and there are still other reasons for top working avocados.

So a field day for explanation and demonstration was set aside by the Los Angeles farm advisor, Friday, June 30. In the forenoon the meeting was held at the West India Gardens, Altadena, and in the afternoon on the Edwin G. Hart lands at North Whittier Heights. The preliminary talks were made by Assistant Farm Advisor Ryerson, under whose charge the meetings were held. The topworking demonstrations, budding and grafting, were performed by Carter Barrett, of Puente, and S. W. Funk of Charter Oak.

The budding is done by practically the same methods as those in general practice for citrus trees. Of course, the avocado buds are much larger, but the details of operation are similar. The more common grafting is the same as used in top working walnuts. Mr. Funk showed one other method by which he has had good success. It is by fitting a scion of at least a half inch diameter into a three cornered pocket two or three inches long, made down the side of the sawed off trunk. Two knife slits are made a half inch or more apart for two inches or a little more down the side of the trunk, beginning at top of stub and cut in so that the knife cuts meet a half inch or more deep in the trunk. This leaves what a carpenter would call a three cornered "gain" out of the tree. The piece taken out is a quarter-round, two inches long and a half inch on each face. Into this is fitted a scion, just as a carpenter would do it. This method gives the cambium two inches on each side whereby to form a union, surely an assurance of success if the joinery is well done. One or two small nails complete the cabinet makers job, which is then waxed over as in all grafting. Grafts by this method three years old, are now thrifty trees.

## ALMOND TARIFF—SO FAR, SO GOOD

An import duty on foreign almonds of five cents on unshelled and 15 cents on shelled has been written into the new tariff bill by the senate, but the unrelenting opposition of the candy manufacturing interests obliges California almond farmers to continue their fight until the five and 15 cent duty finally becomes law.

"If the almond growers of the state continue to support the California Almond Growers Exchange," writes Manager T. C. Tucker, "and back up the efforts of the California senators, the five and 15 cent duty will be in the new tariff bill when the president attaches his signature to it. It is a foregone conclusion that confectioners will continue their fight on this schedule, attempting to substitute lower rates when the tariff bill comes up for final vote. The action of the senate as a committee of the whole, however, virtually demonstrates the futility of such attacks. The real danger to the almond schedule lies in the conference between house and senate committees after the bill leaves the senate."

---

Imperial Valley will ship out about 150 carloads of grapes.

## FARM BLOC SAVES GRAIN TRADING BILL

The house has passed the new measure drawn up as a substitute for the Capper-Tincher bill passed last year, and later held unconstitutional in some of its provisions. The new act would regulate the grain trade and prevent manipulation under the interstate commerce clause of the constitution. The first bill attempted to attain effective public regulation of the grain pits by taxation, which the supreme court held was a wrongful use of the taxing power. Credit is given to the farm bloc for saving this bill from death in committee.

---

The Sun Maid Raisin Growers have sent a representative to Latin America to make a commercial survey of conditions in Mexico, Central America, South America and West Indies.

# How To Crowd Two Days' Tillage Work Into One

MANY jobs are done on Fordson farms that would not be done if horses were depended upon for power. More thorough seedbed preparation is possible because there is more time available for this important work. Good farming practice demands that stubble be disced immediately after removing the grain from the fields, to return valuable humus to the soil, to make fall plowing easier and to conserve moisture.

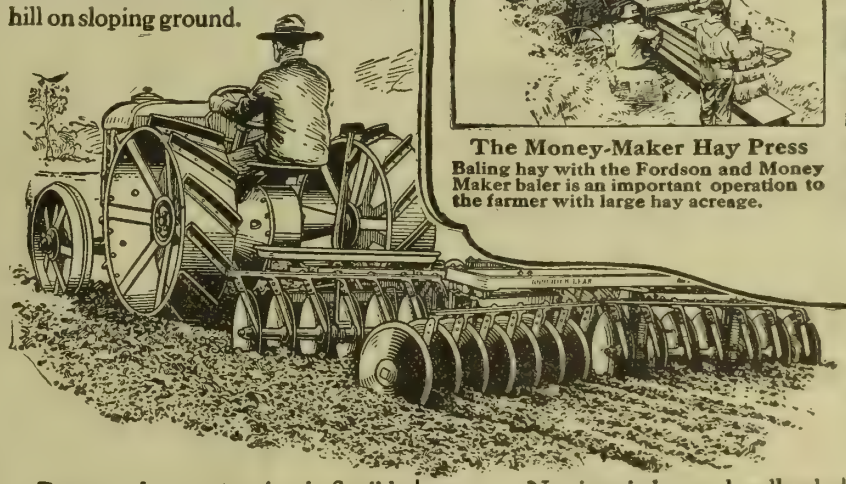
The success of the next crop may depend upon this saving of moisture already in the soil. For this work with the Fordson, as well as for cutting up corn stalks, cotton stalks, and for many other jobs, no other implement does as well as the double disc harrow. There is one disc harrow especially built in every feature to work with the Fordson.

**Roderick Lean**
**Automatic Engine Disc Harrow**

Made dy Roberick Lean Mfg. Co., Mansfield, Ohio

This tool is operated entirely from the tractor seat, and the angle of the discs changed by the power of the tractor, providing quick and easy adjustment without stopping and with little effort on the part of the tractor operator. The entire harrow may be fully and instantly straightened for wheeling through a wet spot, or over an obstruction, while the tractor is in motion.

Working your ground with the Roderick Lean means working every foot of soil. Double reach bars connecting the rear harrow to the front, make the rear disc blades always cut midway between the cuts of the front blades. They cannot track. The rear section cannot slide down hill on sloping ground.



Because the rear section is flexibly connected to the front, this harrow turns short and works close in field corners. No time is lost at headlands—straightening of gangs for turning is unnecessary. The harrow works at uniform depth its entire width, leaving headlands level and well pulverized.

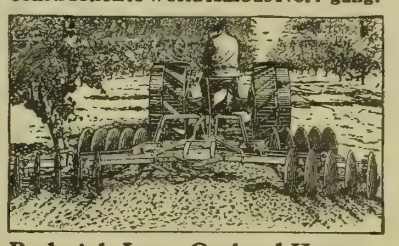
These and many other features have placed the Roderick Lean Automatic Engine Disc first in the estimation of Fordson owners.

**The World Famous Oliver No. 7**
On thousands of farms, the world famous Oliver No. 7 has been the plowing partner of the Fordson from the beginning.

**Special Oliver Orchard Plow**
Fordson orchard plowing is done thoroughly with the Oliver special orchard gang. Branches and trunks are not injured.

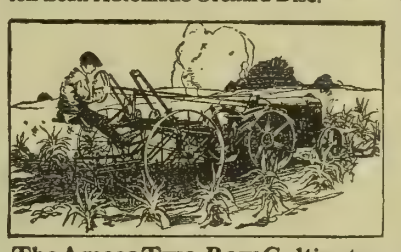
**Oliver Single Bottom Sulky**
For deep mouldboard plowing in trashy conditions with the Fordson. Similar in construction to world famous No. 7 gang.

**Good Work With Roller Pulverizer**
Final Fitting of the seed bed with Fordson power and the roller pulverizer has meant more bushels for many farmers.



**Roderick Lean Orchard Harrow**
Orchard discing with Fordson speed with gangs set in or extended with the Roderick Lean Automatic Orchard Disc.

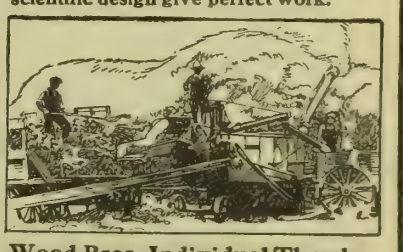
**The Amsco Tractor Drill**
Tractor speed and accuracy utilized by the Fordson owner with the Amsco special drill. Force feed makes positive planting.



**The Amsco Two-Row Cultivator**
Cultivating corn is easy for the Fordson farmer with the Amsco Cultivator—special for the Fordson. Made for hard work.

**Money-Maker Ensilage Cutter**
Fordson silo filling with the Money-Maker done quickly and cheaply. Strength and scientific design give perfect work.

**The Money-Maker Hay Press**
Baling hay with the Fordson and Money Maker baler is an important operation to the farmer with large hay acreage.



**Wood Bros. Individual Thresher**
The Wood Individual Humming Bird Thresher and Fordson make short work of threshing. All grain is saved.

**Ford Dealers Everywhere Sell Standard Fordson Equipment**

# The Perfectly Good Engine

A GOOD engine is a time and labor saver for both man and woman. On the average farm, there are many tasks—small in name, but big in importance—that must be done every day in the year. Pumping water, sawing wood, turning the cream separator, the churn, and washing machine are "muscle" jobs on the average farm. It is back-breaking work that can be done for a few cents a day with an

**INTERNATIONAL**
**Kerosene Engine**

These high grade engines, built in four convenient sizes, operate on kerosene (common coal oil) as fuel. The materials used in the manufacture, and the quality of workmanship employed, are of the highest grade obtainable. One-piece crankshaft, removable cylinder sleeve, built-in magneto (no batteries), and wide faced belt pulley—all these are regular equipment. You get more for your money in an International than you can get anywhere else. Don't let another year go by with the members of your family laboring over the life-shortening jobs that can and should be done with an engine.

# How About the Black Monukka Grape?

By Fred K. Howard

Prospective planters are probably as much interested in this question as they are in any other single question regarding the grape industry except, perhaps, that of future prices. A great many people feel, perhaps rightly so, that the Thompson Seedless is being overdone, and that there is danger of glutting the markets with Emperors and Malagas. And it is undoubtedly this characteristic of looking ahead which prompts those who wish to go into grape growing as a profession to cast about for some variety which promises to be better than the common ones named above. The result of this continued interest in the Black Monukka is likely to cause some severe jolts to those who go ahead and plant it without due regard to its limitations. The Black Monukka is a new variety and in an experimental way it gave promise of being an exceptionally fine dual purpose grape. This fact was widely advertised and a great deal of interest was taken in its development. Stock for planting was scarce and, in fact, difficult to obtain, and while the pioneers with this variety were honest in their efforts to prevent a mad rush into its planting, enough of the stock has now been distributed over the state that the situation is beyond their control. Last season there was considerable speculation, both in cuttings and rooted nursery stock of this variety, and early indications are that this speculation will be more than duplicated this season if the demand for stock continues at the present rate.

### Black Monukka Still an Experiment

Very little is known regarding the shipping qualities or consumer demand for this grape, and still less is known regarding the consumer demand for it as a raisin. And it is entirely possible that when, after acreage develops and enough is in bearing to permit placing quantities on the market in the form of fresh grapes and as raisins, growers will find that the consuming public is not to be easily weaned away from the standard varieties. This would mean that it would be necessary for them to set a low price on their product until the consumer could be educated to its superiority. The fact that all agree that the Monukka looks good will not sell a crop at a profitable price. There is a chance that the Monukka will prove to be all that is hoped for it, but it would appear to be wiser to treat the planting of it as an experiment. Some growers are of course in a better financial position to experiment on a large scale than are others, and those who go into the business should regulate their plantings on such a scale that complete loss of crop or returns from their acreage will not seriously affect their ability to keep ahead of their creditors.

# Grafted Citrus Resisted Frost

A Mississippi subscriber of the Cultivator, living at Hattiesburg, writes:

"I was an interested reader of Mr. Brandt's letter in the Cultivator of June 17, on 'Frost Resistant Strains of Oranges,' so much so that I will submit some observations of my own on this interesting subject.

"Fortunately for the Gulf Coast citrus section there has been no severe weather since November and December, 1916, so that the test is yet in an experimental stage. Therefore these observations are passed on to the readers of the Cultivator without an attempt at explanation, hoping that some Pacific Coast orange grower may be interested enough to experiment further.

"In the early part of the winter of 1916, the writer was living at Biloxi, Mississippi. On this place there were ten acres of Satsumas just coming into bearing. This freeze was general along the Gulf Coast of Mississippi and Alabama, and came early in the winter before the growing wood had time to harden. Three-fourths of the trees in this grove were either killed to the bud or entirely destroyed. Some few near the house on high ground overlooking the bay were hurt but little, while most young trees throughout this section were badly damaged.

"So much by way of introduction, and now I will note my observatoins of some frost resisting orange trees, that safely survived the severe winter of 1916.

"A few years before this freeze occurred there was growing in a nursery at Woolmarket a small block of nursery stock that was not at the time in a suitable condition for successful budding, so the stock was grafted. Later when the foreman for the nursery company left their employ to manage a farm of his own he planted an orange grove. He was granted the privilege of selecting his trees in this nursery. Every tree selected was a grafted tree. Also some of these grafted trees were sold and planted near Grand Bay, Alabama. Some were planted by the nursery company as an experiment. Before these grafted trees reached bearing age occurred the hard freeze of 1916. If my recollection is correct, the mercury dropped to 19 and the orange industry got a severe jolt along the Gulf Coast.

"While young budded trees in the same and nearby groves were either killed or severely injured the grafted trees escaped injury. Since then mild winters have not permitted a second test of cold resisting properties. This nursery since then propagates both budded and grafted trees. The writer now living 60 miles north of the recognized Gulf Coast citrus belt, will arrange this coming season to plant some grafted orange trees to further test the cold resisting qualities of grafted over budded orange trees.

"I would like to see some California nurseryman try grafting some Navel and Valencia orange trees and note the result. Sometimes, seeing is believing, yet one test is not sufficient to prove its worth, when millions are invested in this great industry."

### APRICOTS AND FROST

In years gone by, when a piece of ground was found to be too much subject to sharp frosts to make the planting of citrus advisable, the usual determination was: "I will put it into deciduous fruit trees for any of them will stand all the cold that comes to this section." Of course, this was, and is, true so far as the tree is concerned.

But many orchardists have found to their sorrow that hardiness of tree is not the only factor to be considered, and because of the continuance of unwise planting by the novice and newcomer is this article written. Greater care is necessary in selecting sites for apricot planting than for any other fruit tree in the great rose family, and all on account of late spring frosts visiting many otherwise favorable locations.

For the apricot is an early bloomer and if one sharp frost occurs when the trees are in full bloom or fruits are small the crop will be very light or none at all. But very few feet in elevation is necessary to bring comparative safety. Apricot orchards are known that on the whole are very profitable, but in a low corner or end the crop over a series of years would scarcely cover expense of ordinary orchard care. In some cases these low spots are replanted to plums or some fruit less liable to injury from late spring frosts. As for soils, the range may be great. The largest and finest apricots observed by the writer in a third of a century's observation were Blenheims grown in fine pure sand of great depth, on the edge of a wash which was dry in summer but a raging torrent during heavy rains. For food the trees relied upon that washed down from orange orchards above, and the roots below were always in damp sand, though at a depth of several feet in late summer.

# Marketable Celery Needs Careful Handling

IN view of the widespread publicity given last year on account of the fact that celery was too heavily coated with arsenic and spraying was improperly done, this paper was prepared to avoid any similar occurrences the coming year," writes R. E. Campbell, assistant entomologist of the U. S. bureau of entomology, stationed at Alhambra.

Celery grown in certain parts of Southern California is subject to damage by the celery leaf-tyer, a pale green worm which, when full grown, is about three-fourths of an inch long. It feeds on the leaves and stems of celery, and not only destroys much of the foliage, thereby checking the growth, but makes the celery unsightly and frequently unmarketable. Irregular holes, which soon turn dark colored, may be eaten in the stems.

The worms come from eggs laid by a small brown moth which may be seen fluttering about over the fields at dusk. The eggs are placed on the outer leaves, usually on the undersides, and resemble minute flat fish scales. In warm weather the eggs hatch in four or five days; in colder weather in a much longer period. When hatched, the worms begin feeding on the foliage, usually on the outer leaves where the eggs are laid, continuing here until almost mature, when some descend and feed on the stems. The worms become full grown in from three to eight weeks, depending on weather conditions, and then enter the pupa, or resting stage, in which they remain from one to five weeks. From this stage they transform to the moth which in a few days resumes the laying of eggs.

### Don't Plant Near Beet Field

There may be five or six generations or broods in a year, three or four of which occur during the six months from June to December. These insects feed on sugar beets, so that it is not good policy to plant celery near a beet field. When the latter is harvested, the moths fly over to the celery and lay their eggs, which will result in a severe reinfestation of worms in the celery soon after the beets are harvested. If celery is planted near a beet field, it should be carefully watched for worms when the beets are plowed up.

### Control Measures

The best method of controlling the celery leaf-worm is to poison the caterpillars with arsenate of lead. The latter is also poisonous to human beings, hence extreme care must be taken in its application. A small amount of poison can be applied to the plants with safety, but a heavy application may subject the celery to seizure and the grower to arrest.

Since the young worms begin feeding on the under sides of the leaves, it is important to place the poison there. A fine mist-like spray should be used, and a light but thorough application made to both sides of the leaves. The tendency in the past has been to use too much poison and apply too much spray per acre. By using a nozzle which will give a fine misty spray, 100 gallons should cover an acre of celery. Not over three pounds of lead arsenate should be used per 100 gallons of water.

The young celery should be watched both for eggs and young worms. When these appear in numbers, the poison should be applied promptly. It may be repeated, but this should not be necessary oftener than twice a month. Careful spraying should be done, so that the poison will be evenly distributed over the entire plant. This will keep the worms in check. Only growing, not mature, celery should be sprayed. It is necessary to cease spraying operations from one to three months before the celery reaches maturity, or is marketed. This length of time depends on weather conditions, being shorter during the rainy season.

### Mature Celery Must Not Be Sprayed With Arsenicals

If absolutely necessary to spray full grown celery on account of worm damage, 1 pint of nicotine sulphate and 4 pounds of soap to 100 gallons of water should be used.

If celery blight is present, the lead arsenate may be added to Bordeaux mixture in the same manner as it is used with water.

If the dry method of application is preferred, powdered lead arsenate may be used, being diluted with lime or some other dust, so that the application can be made at not over 3 or 4 pounds of lead arsenate per acre. Dry Bordeaux mixture or dehydrated copper sulphate can also be used with the powdered lead arsenate.

It is the belief of both the bureau of entomology and the bureau of chemistry of the United States department of agriculture that the above recommendations, if carefully adhered to, will be entirely satisfactory. Celery, however, sprayed with an arsenical cannot be absolutely guaranteed to be free at marketing time. It is therefore suggested that in carrying out the plans an occasional analysis be made in order that the grower may be certain that his celery, at harvest time, will pass a satisfactory test.

### CONTROL ARGENTINE ANT TO CHECK MEALYBUG

The first step in controlling the citrophilus mealybug, which is a pest of the citrus fruit industry for which until recently no satisfactory control measures have been worked out, is to get rid of the Argentine ant. Argentine ants are very fond of the sweet substance known as honeydew, excreted by mealybugs and other soft scales and are always very attentive to them, to the extent of preventing many of the natural insect enemies of the mealybug from approaching.

The bureau of entomology of the United States department of agriculture has made a study of the life history and distribution of the citrophilus mealybug, and in a new department bulletin, No. 1040, "Control of the Citrophilus Mealybug," by R. S. Woglum and A. D. Borden, entomologists, suggestions for eradicating the pest are presented.

The Argentine ants may be controlled by the use of a special arsenical poisoned syrup in small containers, one to each tree. These are best distributed during the autumn or spring. Banding the trunks of citrus trees with strips of burlap about 5 inches wide from February to April attracts ovipositing female mealybugs and enables the fruit growers to destroy the eggs in wholesale fashion. The burlap bands have to be removed and dipped in a distillate mixture for which a formula is given in the bulletin. The tree trunks are then sprayed and the clean bands replaced. A distillate soap powder emulsion is used after the mealybugs have massed on the trunks and just before the eggs begin to hatch. This is usually done during the latter part of May.

The propagation of certain insects which are natural enemies of the mealybugs is also recommended. The principal species for this purpose are Cryptolaemus montrouzieri, Leucopis bella, Chrysopa spp., and Scymus sordidus.

### GOOD KEEPERS

The possibility of keeping the Mammoth almond over a long period without deterioriation of the sweetness and size of the nut has been demonstrated by W. N. Woodson of Corning, one of the pioneers in the development of the Tehama County district. Twenty-one years ago Woodson put away a few pounds of Bidwell Mammoth almonds. Recently he cracked a few of them in the presence of interested friends and found the kernels to be just as fresh and sweet as they were when first gathered.

**Fall Irrigation will develop Bigger Crops Next Year!**

Are you prepared? Liberal applications of water in orchards during the Fall months STRENGTHEN and REVITALIZE the trees, assuring a heavy crop the following year. This increase in your next year's crop production will go far toward paying the cost of installing an efficient pump. You can reap the profit of this increased production by installing a LAYNE & BOWLER PUMP NOW! Get in touch with our water engineers at once.

*Capacities: 180 to 4500 Gallons per minute. "Let the World's Largest Water Developers Solve Your Pumping Problems."*

# Well-bred or well-built, quality always shows

If you were buying a horse or a steer or a breeding animal of any kind, conformation would count heavily in your estimate of his value.

Fine lines and proportions have the same meaning in a motor car. The knowledge and skill which created the powerful long-stroke Earl motor and the balanced Earl chassis, likewise provided the comfort and beauty of the Earl's high-grade bodies.

At $1095, The Earl is the great motor-car value of the year. No other car of the same wheel base swings so near the road or hugs it so closely on sharp turns or at speed. The rigid 7-inch channel frame with five cross members, rugged Earl-forged axles, 56-inch rear springs, Earl-built steering gear, transmission and carburetor cannot be matched in quality and efficiency by any car in the Earl's price range.

On rough and broken roads, the Earl's performance and economy are unusual *for a motor car of any size*. In the sixth annual A. A. A. Economy Run from Los Angeles to Yosemite Valley—360 miles over heavy mountain roads—an Earl touring car averaged 30 miles per gallon of gasoline and won the highest ton-mileage rating in a field of sixteen big and little motor cars.

Write *now* for the illustrated Earl handbook and the name and location of your nearest Earl dealer. You can't afford to buy any car at any price until you have examined and driven the quality Earl.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Avocado Culture

I have 30 Fuerte (?) avocados eight and nine years old. They have borne very lightly for three or four years but never more than a dozen on a tree. They blossom heavily but fruit does not set. They have blossomed since the January freeze but on the 30 trees there is not more than a dozen fruits. Irrigate once a month and mulched last year but the soil is heavy and the mulch molded so I took it away. The trees were growing well when I bought the place but I do not know if they are budded or not. Red lady birds cluster thickly in blossoms and elsewhere; are they harmful? Would like to know what culture and care should be given to cause trees to produce good yield of fruit.—Subscriber, Athens.

It seems doubtful if trees are Fuerte as that variety is very precocious and fruits freely at three years of age. The fruits alone will tell what they are, though experts know Fuerte by foilage. If fruits are alike on all trees, the latter are budded; if much diversified, they are doubtless seedlings, though you may have several budded varieties. Again could experts determine this but only on seeing trees. The lady birds do no harm. The mulch was good and if the moldiness alarmed you it would be easy to turn it over. It should have been spaded into soil, or if too bulky, at least part of it, and the remainder left on top. Avocados are partial to mulches. Your soil evidently needs plant food and organic matter. A heavy application of stable manure would prove highly beneficial. A fertilizer when trees begin to blossom would aid in setting the crop. If your trees are of the Fuerte variety we believe they are starving. If your soil is heavy it may be irrigation practice is not sufficiently thorough to wet the soil deeply. In general avocados need about the same culture as oranges.

### Moving Orange Trees

When are the Limoneira people moving the six year old Valencias and can I move without a crane to lift them? Subscriber, Tustin.

The Limoneira moving commenced in May and will doubtless continue to about August. The crane is used because of the great number to be moved and the quickness with which trees may be handled. The trees are not too heavy to handle by "main strength" but we would suggest using a stone boat for hauling as the task of loading and unloading from high wagon would entail heavy labor and time outlay. Roots should be cleanly cut on ends and kept damp during moving, watering at once when planted or better still, put in holes having water in them.

### Subirrigating Trees

I have some shade trees in my back yard (which is hard ground) and wish to know if I can water the trees by putting a pipe (say 1½ inch or so) about 18 inches long in the ground near the tree, leaving a few inches out and putting a hose in it and let the water run, thereby not having to dig a trench around the trees.—Subscriber, Terra Bella.

You can water your trees in the manner suggested provided you use a larger pipe and have it perforated so as to allow the water to seep into the soil. We would suggest not less than a four inch pipe with numerous perforations from top to bottom. If the soil is very compact it would be best to have two or more of these pipes for each tree.

### Budding Deciduous Trees

Could you please tell me when is the latest time of the year that budding of deciduous trees can be done?—Subscriber, Terra Bella.

Deciduous trees should be budded in July and the first part of August. However, August may be a little late in some sections.

### Kadota Figs

Kindly send me a bulletin on the cultivation of Kadota figs. We have taken up a grove of orange trees near Exeter and are advised to set out with Kadota figs. Our soil is adobe, and we are anxious to know if figs will grow in any but sandy soil.—Subscriber, San Jose.

Sorry, but the Cultivator does not have bulletins to distribute. This question was referred to I. J. Condit of the California Peach and Fig Growers, and he answers:

"This variety of fig has been largely planted in heavy soils in the Tulare and Fresno County sections, and I see no reason why it would not grow in adobe soil, providing other conditions are correct. The orchard of W. Sam Clark at Sultana is on a heavy clay soil which is very difficult to work. Other orchards on clay soils are doing well and I see no reason why the trees should not thrive in adobe. The Kadota tree is no more hardy when young than the trees of other fig varieties, and frost injury during the first few years is very common. I have no literature, at the present time, for distribution but can give you, in the appended list, references which you can look up in any good library."

### Nematodes

Kindly tell me through your valuable paper is there is a soil treatment that will eliminate nematodes and root knot and how is it used?—Subscriber, Porterville.

Any treatment that will destroy other insect life in the soil will kill the nematodes. There is no economic method for the field, however. In greenhouses the soil beds are steamed and some are occasionally drenched with formaldehyde. Small lots of soil for seed purposes are sometimes baked. All these methods are too expensive for the field. About 80 per cent of the nematodes are in the top six inches of soil but in very loose soils some range very deep. Fields infested can never be cleared but the nematodes may be controlled. Even drying through summer following destroys many as they need moisture to remain living.

### Morning Glory

How can I get rid of morning glory?—Subscriber, Potter Valley.

There is no method so effective as digging it out and keeping at it so closely that no leaves can grow. It cannot therefore breathe and must perish. Small patches may be dug by hand, but larger areas should be plowed and cultivated dry for one summer and the area subsequently closely watched and all appearing tops killed. Chemicals, salt, etc., have not given satisfaction, so it would seem elbow grease is the only means to the desired end.

### Lady-birds

Please tell me what are the red bugs that are all over the garden in the corn tassels and where the ears are forming. Some say they are lady-bugs, but they are too red. The 12-spotted lady-bug seems to be among them. I fear they are destroying the corn. Do they eat plants?—Subscriber, Glendora.

No red is too bright for some species of lady-birds quite common; the several species vary in color from orange to scarlet or even crimson, though the latter is dark for the more common species. They do not eat vegetation or destroy it in other ways. The 12 spotted is very destructive with a wide range of plants.

### Association Addresses

Please give us the address of the California Bean Growers Association, also the address of the Central California Egg Producers Association.—Subscriber, Turlock.

The address of the California Bean Growers Association is 120 Battery Street, San Francisco. Address of Poultry Producers Association of Central California is 757 Sansome Street, San Francisco.

### Processing Prunes

Through your question and answer column will you kindly tell me how prunes are processed for a commercial pack? Enjoy being a subscriber of your paper and derive much valuable information from this column.—Subscriber, Oroville.

Prunes ripen and drop from the tree naturally. They call for three pickings during harvest. Toward the close of the season the remaining fruits may be brought down by lightly shaking the trees. Experienced growers grade their prunes into three sizes. The fruit is placed in a wire basket and dipped for a few seconds in a solution of lye (one pound to 30 gallons of water), held at the boiling point. Shake basket sharply so fruits will shift position and be wet on all sides. Dipping the prunes causes a slight checking or cracking of the skin near the stem end, which facilitates drying. If the lye is too strong or immersion too long, the skin may peel off. After dipping the prunes are spread in a single layer upon trays and dried in the sun. They may dry unevenly. In the cool of the day the properly dried fruits may be removed. Prunes are dry when they are leathery to the touch but not hard enough to rattle against the tray. When too dry they may be dipped momentarily into boiling water and piled in bins or on a clean floor while still damp. The moisture is soon equalized. It is well to turn them over with a shovel a few times.

### Ferns With Scales

Please tell me what is wrong with enclosed fern leaves? They are covered with brown bugs. As soon as new leaves open they get brown like these. Ferns are potted in pure rotted leaves gathered from under oak tres and are given best of care.—Subscriber, San Luis Obispo.

Fern leaves were infested with hemispherical scale, a large brown one, and the small whitish wistaria scale, but neither or both together could cause all that seems wrong. Repot your fern in half present leaf mold and half good garden loam and then put a little leaf mold on top. Ferns seldom root in leaf mold but grow through it to firmer anchorage below, often adobe or clay. Your soil is probably too loose. Cut off and destroy old top before repotting and if scale reappear pick off by hand until no more hatch.

### Malagas and Monukkas

Would you advise extensive planting of Black Monukka grapes? Will they ship well? Do the Red Malagas bring a better price than the White? Is the Red as good a shipper as the White? What do you think of the future of the Red Malaga and Black Monukka?—Subscriber, Modesto.

Question as to Black Monukkas is answered on another page. As to Malagas, it is the general belief that colored varieties of grapes sell easier than the white varieties. Prices received for crops, however, depend on the conditions in the markets when the shipment is made, color, quality, and condition of the fruit. These things being equal on the red and white Malagas, the red type should bring better prices on the average.—F. K. H.

### Watering Asparagus

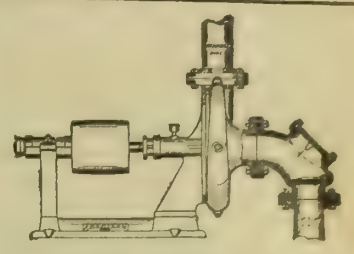
Would you advise watering an asparagus bed during the summer months? If so, how often? I live in a very hot dry climate and the ground gets very hot and dry. How much foliage is best to let grow, and should it be cut off in the fall?—Subscriber, Esparto.

You certainly should irrigate your asparagus during the summer months as it is at this time that the plant is storing up energy to make sprouts the next spring. Once in two weeks should be often enough to keep it in good growth. Allow all the shoots to grow after the first of June. Cut the foliage off as soon as rust appears, if any, or not later than November 1.—D. F. R.

### More Economical Pumping

I have a 5 inch pump and 12 horsepower commercial engine. Pump is 18 inches above water and 18 inches from top of ground. Discharge pipe is four feet higher, which is not necessary. When I irrigate gauge on pump shows 26. How much more water would I get by cutting off the four feet or how much gas would I save? It takes 1½ gallons an hour as it is.—Reader, Bakersfield.

You are drawing the water too low and showing too much suction on the vacuum gage for economical work. Either the water is not coming into the well fast enough to supply the pump, or the suction pipe is too small, and it is possible you will get all the water the well supplies if you will put a slightly larger pulley on the pump and run it slow enough to have the gauge show only 20 feet vacuum, if the trouble is not caused by small pipe. Then by taking off the extra four feet of discharge pipe a further saving of nearly one-sixth of the power will be made and altogether make a saving of one-third the power used, or the use of one gallon of gasoline per hour instead of one and one-half gallons. The taking off of the extra four feet of pipe will not increase the flow of water but will save gasoline.—J. B. N.



American Centrifugal Pumps

Every American Pump is guaranteed to meet all conditions specified and to perform the work for which it is sold. If your water problem can be solved with any pump it can be solved with an American. Write for catalogs of horizontal and vertical centrifugal pumps and deep-well turbines and name of your nearest dealer.

### MY FLORAL SCHOOL

My garden is a little school,
Its flowers the pupils rare;
Obedient ever to the rule
Of the High Master there.

Great honor has been given me
In such a place to teach;
To fit the flowers for ministry
And send them forth to preach.

For on their Graduation Day,
In beauty and in pride,
As teachers, preachers, healers, they
Are scattered far and wide.

My little school is never done,
For in the lowest class
Are buds whose life has just begun,
With many grades to pass.

And often from some Graduate
I hear the happy tale;
He is a mighty potentate
Where other healers fail.

If I must never send them out,
But keep them all in reach,
Though bounded by my love about,
I would not care to teach.

—Bessie Alice Hallock.

### STAREYES AND THE SKY BLUE KEY

By Clara Peterson

(Concluded)

"And so, children," said grandmother sadly. "My box of coins lies locked in the palace unless someone has found the key. However, we shall get along someway. Now, Bab, brush up the crumbs while I change my apron and then for your naps."

The children kissed the old willow bird cage and looked loveingly at the ball of yellow feathers. Then they went into the bedroom. The grandmother tied on her white apron with wide insertion at the bottom and went out the door, carrying a basket of sweet smelling clothes. The room grew perfectly still except for the clock. Stareyes hopped down to the bird cage door. She reached her tiny white hand between the willows and undid the lock. Then out she flew and through the open window.

Stareyes lived with her older cousin Goldwings in a little house under the oak tree. She found Goldwings seated at lunch, but she wasn't eating; she was weeping into her crystal teacup. Stareyes threw her arms around the older fairy's neck.

"Oh, Goldwings! I'm back and I've had such a time. Just a buttercup sandwich for I'm starving and then I shall tell you about it."

When Goldwings would stop hugging her, Stareyes began to tell her story. She had told almost everything when she came to the part about the sky blue key falling from the sky blue box (and there were tears in her eyes for she wanted so badly to do something for Bab and Bobbins and their grandmother.)

"A sky blue key!" cried Goldwings, who also had tears in her brown eyes. "Now let me see!"

She began to dance around the table.

"Now I know where I've seen it. We'll get it! We must have it! It's in the magpie's nest."

To tell the truth, Goldwings was rather vain of her long braids of brown hair and her sparkling eyes and almost every time she flew high into the oak tree she stopped at the door of Mr. Magpie's nest and peeked in—just because there was a little round mirror across from the door.

"On sunshiny days I've often seen a sky blue key sparkling there near the mirror!" cried Goldwings. It's woven into the nest. Oh, he has dozens of things that he picks up everywhere. I'm sure he'll give it to us."

After the two fairies had finished the sandwiches and the rose petal cake Goldwings made Stareyes lie down for awhile and she put on her very best dress of corn silk fringe and flew away to see Mr. Magpie.

At Goldwings' knock on the limb Mr. Magpie put on his blue spectacles and stalked out.

"Ho hum!" he said when she had told him the story. "Yes, it was about four years ago I found that key lying in the dust, but I must say I hate to give it away. I'm trying to collect one specimen of everything in the world and goodness knows when I shall find another key. But now say I should turn it over to you, what will you give me for it?"

"My pink party slippers with the opal heels," said Goldwings because these were the best things she could name.

The magpie shook his head.

"My cobweb fan—my seafoam dress—my best tablecloth with the pearl trimmed lace."

Mr. Magpie wasn't even listening. He sniffed several times and said,

"I think I smell cookies or something. It's many a day since I tasted home cooking."

Goldwings' eyes grew very bright for she thought at once of the one thing she could do better than anyone else in all the land.

"Mr. Magpie," said she very loudly. "If you will give me the sky blue key I'll bake you five dozen of my finest doughnuts!"

The magpie stuck his head on one side and smacked his beak.

"Five dozen—60, sweet, brown, tender doughnuts—all covered with powdered sugar and smelling of nutmeg!"

"I don't believe that key is woven in so very tightly," said Mr. Magpie.

He crawled into his nest and in a couple of minutes came out carrying the little key which shone gladly in the sun.

"We'll just leave it on this branch until you bring the doughnuts," he said.

Goldwings started happily away.

"Ahem—just a minute!" called Mr. Magpie. "As you know, this is a very valuable key and I really must request that you make the doughnuts without holes!"

So all that afternoon Goldwings and Stareyes cut out square doughnuts with a drop of pineapple jelly instead of a hole in the center of each. They sang as they worked. How gleefully they sang and how very hard they worked!

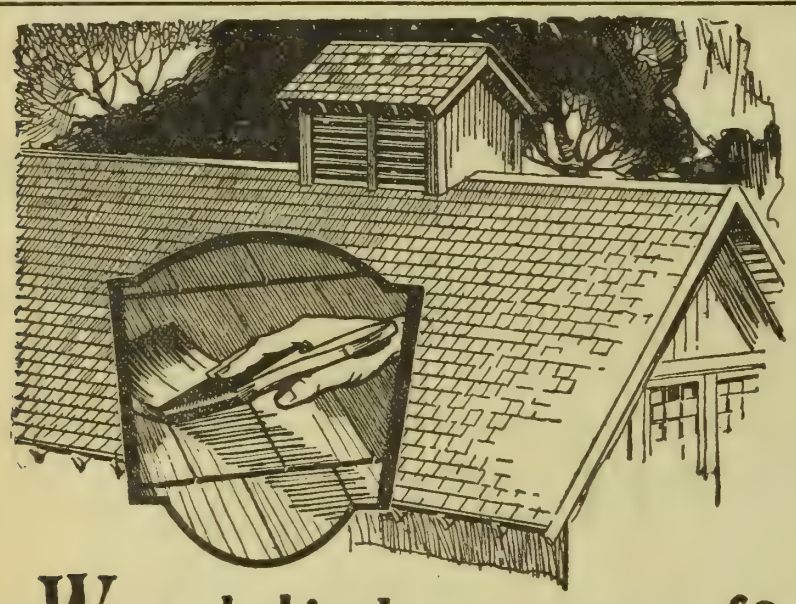
It was sundown when they got the key and I'm afraid Mr. Magpie had indigestion all night, but the best thing about the whole day was this:

Just at dusk Bab and Bobbins and grandmother were sitting lonesomely on the porch thinking of the sky blue box that couldn't stay with them and the little canary who wouldn't. It was very quiet and the air was sweet.

"I hear something flying!" cried Bab. "Perhaps it is our birdie—our little bird!"

There was the sound of wings over their heads and then something dropped gently into grandmother's lap. She ran with it to the lamplight. "My sky blue key!"

After that the two fairies used to fly past the house every day for it did look so very cheerful and shining. There were new flowers and curtains and the children wore such cunning clothes and grandmother sewed on the front veranda instead of washing all day long. It wasn't long too before there was a real singing canary in the old willow cage and Bab and Bobbins pretended ever after that it was the yellow birdie they had lost.



Warped shingles on your roof?

Shingles exposed to drenching rains, hot sun and wind, soon lose the strength stored in them by nature. Oils and sap evaporate, the wood becomes brittle. Warping and cracking are sure to follow,—*unless shingles are given preservative treatment.*

The time to secure continued life and service for shingle roofs is before the natural oils dry out. ORONITE SHINGLE OIL penetrates the wood fibre and holds in their original strength. It keeps your roofs tight and firm—helps *prevent* warping. In the case of old roofs, ORONITE SHINGLE OIL renews their life.

You can mix ORONITE SHINGLE OIL with colors. We have an agent near you who will give you formulas—also show you how easily ORONITE SHINGLE OIL is applied, both to roofs and shingled side walls.

STANDARD OIL COMPANY
(California)

ORONITE SHINGLE OIL

### SIMPLE DIRECTIONS FOR CANDIED FRUITS

By W. V. Cruess, College of Agriculture, University of California

CANDIED fruits and fruit candies are becoming very popular. The university receives many requests for simple directions for preparing candied fruits on a small scale. This present article is an attempt to satisfy this demand.

#### Preparing the Fruit

Oranges should be cut in half and the pulp removed. The halves are then boiled in water until tender; this will usually require about 45 minutes. Citron, (the kind that grows on a tree and not a watermelon), is cut in half and the pulp removed. The halves are boiled in five or six changes of water until they are practically free from bitterness, and until they are tender. Some prefer to store the halved citron in a strong brine, using 1½ pounds salt per gallon of water for about ten days before they are treated as above. Apricots should not be too ripe. They are cut in half and boiled in water until tender. Figs are boiled whole in water until they are thoroughly tender, using slightly underripe fruit. Peaches, preferably Clingstone, are pitted, peeled, halved and boiled in water until tender. Royal Anne cherries are stored in barrels or in glass top fruit jars in a solution of 2-10 of one per cent sulphurous acid, although for household purposes they may be stored in glass top jars in a solution consisting of one ounce sodium bisulphite and ½ ounce citric acid per gallon of water for about two weeks. They are then stemmed and pitted and boiled in five or six changes of water until they no longer taste of sulphur and are tender. It is possible to use the fresh cherries also. Stem and pit them and boil in water until tender, without using the sulphur treatment at all, but they will not be quite so attractive as if treated first in sulphurous acid to harden and bleach them.

#### Preparing the Syrup

Prepare a syrup of one cup of corn syrup to three cups of water. White Karo is satisfactory. Heat the fruit in this syrup to boiling for two or three minutes, set it aside to cool for 24 hours in the syrup. If the fruit floats put a saucer or plate on it to keep it immersed in the syrup. If cherries are to be candied color the syrup with a small addition of red food coloring matter, which can be obtained from any grocer.

#### Increasing the Syrup

The next day add to the syrup about ½ cup sugar to each three cups syrup. Dissolve in the syrup and heat the fruit in the syrup to boiling and boil for about three minutes. Again set aside for 24 hours. On the following days repeat these additions of sugar and boiling until the syrup becomes about as thick as honey or about 75 degrees Balling, or about 38 degrees Baume. These tests are made by means of a special hydrometer on the cold syrup.

#### Draining and Drying

When the syrup has become heavy as indicated above, allow the fruit to stand in it about three days to thoroughly absorb the syrup. Then place it on ordinary window screen in a place protected from dust and insects. Allow it to drain and dry thoroughly until it can be handled. Pack it in candy boxes. This candied fruit will keep for two or three months usually, although in time it becomes over dry. The dryness, however, can be overcome if the fruit is again placed in a heavy syrup and boiled two or three minutes and again drained and dried.

#### Use of Canned Fruits

Canned peaches, cherries, and pineapples or pears can be made into candied fruit very readily. The require no preliminary treatment and can be put directly into the first syrup. The canning process is then the same as for the fresh fruit. Candied fruit is best when freshly prepared, therefore,

## The Cultivator Patterns

**4053. Misses' Dress**—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 5¾ yards of 32 inch material. If collars and puffs are made of contrasting material ⅞ yard of 40 inch material will be required. The width of the skirt at the foot is 2⅝ yards. Price 10 cents.

**4042. Child's Play Suit**—Cut in 4 sizes: 2, 4, 6 and 8 years. A 4 year size requires 3½ yards of 32 inch material. To trim as illustrated requires ⅝ yard of contrasting material 32 inches wide. Price 10 cents.

**3848. Ladies House Dress**—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 5 yards of 36 inch material. The width of the skirt at the foot is about 2 yards. Price 10 cents.

**4055. Junior Dress**—Cut in 3 sizes: 12, 14 and 16 years. A 14 year size requires 4 yards of 32 inch material. The width of the skirt at the foot is 2¼ yards. Price 10 cents.

**4052. Ladies' Dress**—Cut in 7 sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size requires 5 yards of 40 inch material. The width at the foot with plaits extended is a little more than two yards. Price 10 cents.

**3326. Childs Rompers**—Cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 4 year size will require 3¾ yards of 27 inch material. Price 10 cents.

**4068. Ladies' Apron**—Cut in 4 sizes: Small, 34-36; medium, 38-40; large, 42-44 and extra large, 46-48 inches bust measure. A medium size requires 4½ yards of 27 inch material. Price 10 cents.

**4060. Girls' Dress**—Cut in 4 sizes: 4, 6, 8, and 10 years. A 10 year size requires 3¼ yards of 32 inch material. Price 10 cents.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

**CATALOGUE NOTICE**

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

**PATTERN DEPARTMENT**

**California Cultivator** **Los Angeles**

the writer would advise that only small batches be made at each time, and that surplus fruit be stored or canned in the usual manner until there is need for candying more.

### Chocolate Dipped Candies

Dried fruits of all kinds or candied fruits prepared as above can be converted into excellent chocolate candies by dipping them in melted confectioners chocolate. This chocolate is melted as follows:

Cut it into thin shavings into a shallow pan. Place the pan in water which is heated at from 90 to 95 degrees Fahrenheit. When the chocolate melts dip the dried fruit or candied fruit in the chocolate and place it on an oiled platter. When cooled and solidified it can be packed in candy boxes. The whole secret of success in the dipping of chocolate lies in not having the chocolate at too high a temperature. Candied cherries, chopped raisins and nuts, halved dried pears, peaches and apricots make excellent chocolated dipped candies.

## PRESERVES, JAMS AND BUTTERS

**By J. H. Irish, Fruit Products Laboratory, University of California.**

BY PRESERVES we mean whole fruit or whole pieces of fruit suspended in a heavy or thick sugar syrup. With some fruits this is a very simple product, while with others it requires some skill for success. The quince is a striking example of the former, while the strawberry represents a more difficult fruit to handle. Other berries, such as blackberries, raspberries, loganberries, etc., have a much firmer texture and can be made into preserves with comparative ease. Gooseberries and currants are excellent for this purpose while currants and mulberries make a delicious combination.

Peaches, apricots, plums, cherries, quavas, grapes and other fruits according as they are available and according as they are desired may be made into preserves.

The principles underlying the process of preserving are the same with all fruits.

### Why Fruits Shrivel

The phenomenon of osmosis plays the leading part in the process of preserving fruits. This may be explained in the following manner: Suppose we have a sac of juice comparable to the berry or cherry or piece of fruit. This sac is suspended in a vessel of liquid which corresponds to the syrup used in preserving. These two liquids are separated by a semi-permeable membrane or skin which is represented by the skin of the fruit. The juice passes through this skin into the syrup while the syrup passes through into the fruit. If the process continues, the concentration of the juice within the fruit and the syrup outside of the fruit will become equal. Not all fruits have such texture as to permit the heavy syrup to pass into the fruit as readily as the juice of the fruit passes out. When this is the case the juice passes out of the fruit and the skins become shriveled. Cherries have such a texture as not to permit heavy syrups to pass in readily, so it is necessary to begin with a very light syrup and increase the concentration gradually until the desired concentration is reached. This prevents shriveling.

### Berry Preserves

There are two kinds of strawberry preserves made in California, namely, the one commonly used and that known as sun preserves. For preserves only whole, sound, ripe fruit should be used. The broken and underripe berries may be used in making jam. If it is possible, berries should be preserved the same day they are picked. The berries should be hulled and placed in a wire basket and washed by running water. There is danger of crushing the berries if they are placed in a vessel of water. After draining a few minutes place them in the preserving kettle with an equal weight of granulated sugar. Allow to stand or heat slowly until the water left on the berries from washing and the juice begin to dissolve the sugar. When the sugar has dissolved sufficiently to prevent scorching, bring to a boil, stirring very carefully in order not to crush the berries. Boil rapidly a few minutes until the berries are soft and tender. Pour out into a shallow receptacle to cool for several hours or over night. This gives the berries a chance to absorb the syrup and plump up. Fill into hot jars nearly solid with fruit. If the syrup is not 60 or 65 per cent sugar, it may be concentrated by returning to the fire and boiling. When the desired concentration is reached the jars may be completely filled with the syrup, sealed and pasteurized at 185 degrees Fahrenheit for 30 minutes. Glass jars should be stored in a dark place or covered, as the light acts upon the color of the fruit.

Pasteurizing is accomplished by immersing the sealed jars of preserves in water on the false bottom of a wash boiler sterilizer and heating the water to 185 degrees Fahrenheit for 30 minutes.

### Sun Preserves

Sun preserves from strawberries are made in the following manner: Washed berries are placed in a single layer on a platter or enamel pan. Pour over them a 50 per cent sugar syrup, cover with glass, leaving one end slightly elevated to permit escape of vapor, and place in the sun until the desired concentration of syrup is obtained. The method is very satisfactory in the interior valleys where it is dry and hot. In the damp coast regions it might be necessary to dry in a home size evaporator or over a radiator or in a slow oven.

### Spanish Conserve

The following recipe makes a delicious product: 6 cups rhubarb cut in small pieces, 6 cups granulated sugar, 1 cup chopped raisins, 1 cup chopped orange peel. Boil the orange peel until soft and tender in a pint of water. Pour off water. Place all ingredients in a preserving kettle. Allow to stand a few minutes until the juice from the rhubarb begins to dissolve the sugar. Place over the fire and stir continually to prevent scorching. Boil until the rhubarb is thoroughly cooked and about 220 degrees Fahrenheit or the desired consistency is reached. Place in jars hot; seal and no further processing is necessary.

### Jams

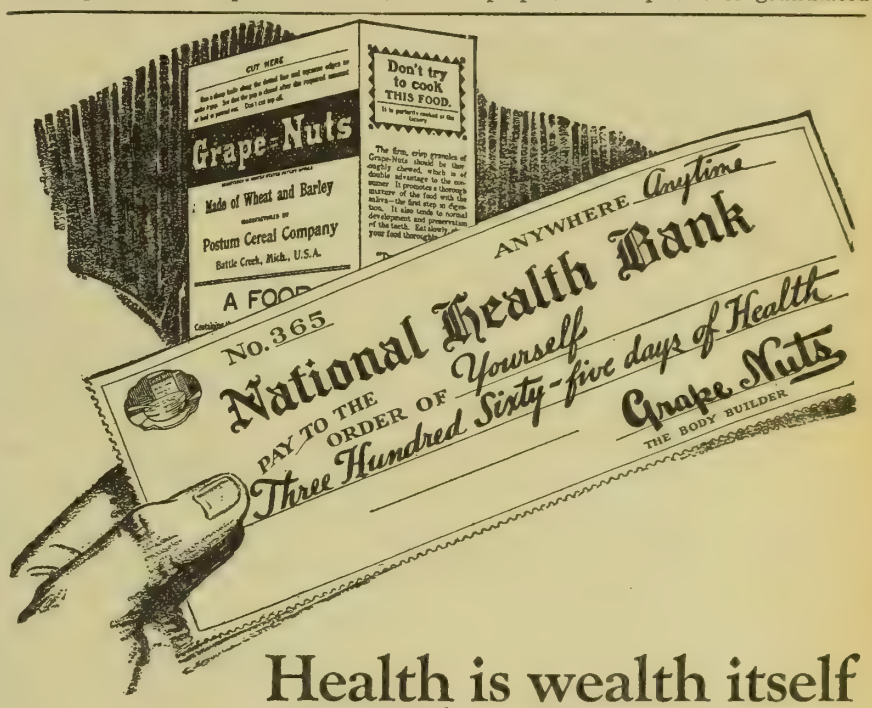
Jams may be made of the broken and imperfect fruit. It is desirable to have some immature fruit to give a jelly like consistency to the product.

The fruit is washed, crushed and placed in the preserving kettle with three-quarters pound of sugar to each pound of fruit. Boil rapdily until the jellying point or 220 degrees Fahrenheit is reached. Place in jars hot and seal. No further processing is necessary.

### Butters or Spreads

Various fruits may be used for this product. Those most commonly used are apples, peaches, grapes and pears. Care should be taken not to allow any decayed fruit to enter the product. The following is the process used in making pear butter or pear spread.

The fruit should be washed, stems removed and fruit crushed or cut into pieces. Place in a kettle; add enough water to cook the fruit. When the fruit is soft, remove from the kettle and pass through a colander or screen to remove skins, seeds, etc. Return the pulp to the kettle. To each quart of pulp add one pound of granulated



# Health is wealth itself

—and depends more upon the selection of proper food than upon anything else.

The reason is simple—the *right* kind of food digests promptly and is absorbed into the blood for building sound tissue; while food that digests slowly may ferment and lead to serious conditions.

Grape-Nuts—the delicious cereal food made from whole wheat flour and malted barley—is so easy to digest that even delicate people and young children thrive on it.

This is only natural, because Grape-Nuts is baked for 20 hours, which transforms and partially pre-digests the starch elements, resulting in easy digestion and quick assimilation.

Served with milk or cream, Grape-Nuts is a complete food—and along with its nutritive qualities is that wonderful flavor!

*"There's a Reason"* for Grape-Nuts

Sold by grocers everywhere

Made by Postum Cereal Company, Inc.. Battle Creek, Michigan.

# EASY NOW TO RID YOUR PLACE OF FLIES

**Widely Known Scientist Discovers Wonderful Chemical That is Fatal to Flies. Not a Poison—Harmless to Stock.**

Flies are one of the most dangerous and annoying things with which the farmer has to contend. Now, through the discovery of E. R. Alexander, widely know scientist, you can rid your house and barns and livestock of these pests almost instantly, and with no trouble at all. This discovery is in the form of an organic chemical that is fatal to flies, and similar pests, such as chiggers, mosquitoes and moths.

This new discovery, which is called Alexander's Rid-O-Fly, is not a poison. Though it kills flies like magic, farm animals and human beings are not affected by it at all. In addition to killing these insects, Rid-O-Fly is a strong repellant. Flies will not come near stock or buildings where Rid-O-Fly has been used. Rid-O-Fly is particularly valuable for cows and horses, as it is a known fact that flies do untold harm to these animals.

So confident is Dr. Alexander that his discovery will rid your house, barns and live stock of these pests that he offers to send a $2.00 supply for only $1.00 on the guarantee that if Rid-O-Fly does not solve your fly problems it will cost you nothing. Two big Kansas City banks guarantee the reliability of this offer.

SEND NO MONEY—just your name and address to the Alexander Laboratories, 1577 Gateway Station, Kansas City, Mo., and this introductory offer will be mailed at once.

# WESTERN CANADA for Big Wheat Crops

Canada is the world's greatest producer of wheat—second only to the United States—yet only about 12% of the tillable area has been worked. Yields of 40 bushels of wheat per acre are not uncommon.

Oats have given as high as 100 bushels per acre, while 40 to 50 bushels per acre are ordinary yields; barley and rye in like proportion. Cattle and horses thrive on the native grasses which grow abundantly and corn and sunflower culture are highly successful.

## Stock Raising, Dairying and Mixed Farming

secure for the industrious settler ample returns for his energy. Clearing the cost of one's farm with a single year's crop has an appeal, and has been done by hundreds of Western Canada farmers. Taxes only upon land (not on improvements). Perfect climate, attractive social conditions, good neighbors, churches, schools, telephones, excellent markets and shipping facilities make life happy as well as prosperous.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, **reduced railway rates**, etc., write to

sugar. Boil until about 218 degrees Fahrenheit is reached. Add quarter cup of lemon juice. When 219 degrees Fahrenheit is reached, add half teaspoon of each of the following spices, cinnamon, cloves and ginger. Stir in thoroughly. By this time, the finishing point will be reached. Remove from the fire, place in cans or jars; seal immediately. No further processing is necessary.

## HOUSEHOLD QUERIES

### Sweet Cucumber Pickles

Can you please give a recipe for sweet cucumber pickles, as nearly like the bought ones as you can?—Subscriber, Santa Ana.

The following directions are from Cruess' "Home and Farm Food Preservation."

Choose small cucumbers. Prepare a brine of 2 pounds salt per gallon water. Place cucumbers in this and keep them submerged with wooden float. Store in this brine for about 4 weeks. Fermentation will take place and a scum will form. If pickles become soft add more salt. After about four weeks remove cucumbers and heat in a large amount of water to the simmering point for about 20 minutes. Discard this water and cover with fresh water. Heat to simmering point, remove from fire and let stand about two hours to soak out excess salt. If pickles tend to be soft or "flabby" add a tablespoon of alum per gallon water. Prick cucumbers in several places with silver fork so that sweet vinegar will penetrate without shrivelling.

Prepare the following syrup: 3 cups vinegar, 5 cups sugar (brown preferred), 1 tablespoon mace, 1 teaspoon ginger root, 2 tablespoons stick cinnamon, 1 tablespoon whole cloves. Boil vinegar and spices together slowly for about five minutes. Heat pickles in the spiced vinegar to boiling point and boil about 10 minutes. Pack boiling hot into glass top jars and seal.

### Plum Jelly Not Stiff

Have just discovered that my plum jelly is not very stiff. Is there a remedy?—Subscriber, Bakersfield.

Plums do not have as much pectin as crabapples and currants, that is, ripe, sweet plums, so if one follows the old time rule of 1 cup sugar to 1 cup juice—which is all right for crabapples or sour plums—the jelly will be too soft. 3-4 cup or even ½ cup sugar is enough with fruits of low pectin and low acid content. Quick cooking in shallow pans of small quantities of juice makes better jelly also. A very complete discussion of jelly making, covering these points will be found on Page 656 of the Cultivator of June 17, written by A. W. Christie. A copy has been mailed to this inquirer as she may have missed this article. It is an exceedingly valuable one and will settle many a jellying problem if kept for ready reference.

### Preserving Figs

If you could give me some recipes for preserving figs I would greatly appreciate it.—Subscriber, Bakersfield.

Directions for preserving in syrup were given by Mr. Cruess in his general article on Methods of Home Canning in the Cultivator of July 1. A new recipe for candied figs was given on Page 38 of the Cultivator of July 8. A general article on Preserves, Jams and Butters by Mr. Irish is given in this week's issue, as is another by Mr. Cruess on Candying Fruits. All of these apply to figs as well as other fruits. In addition we give here suggestions for varying preserves.

Preserved Figs With Ginger.—Choose white figs not overripe, puncture thoroughly with fork so that syrup will penetrate readily, use 1 pound sugar and 2 pints water to 1 pound figs, place figs in kettle, add sugar and water, cook down slowly until figs have become heavy preserve. When canning add three or four pieces of candied ginger. This will flavor the figs sufficiently by the time they are opened for use.

Sweet Fig Pickles—Prepare a syrup of 3 pounds of sugar, 1 pint of water, 1 pint of vinegar, 1 tablespoon of coarse ginger root, 1½ tablespoons of stick cinnamon. One tablespoon of whole cloves may be added if desired. All measurements level spoonsful. Parboil 3 pounds of the figs for three to four minutes in water. Transfer them to the above syrup and cook until figs are clear or a heavy syrup is obtained. Allow figs to stand in the syrup over night. Heat to boiling and pack hot in jars.

Fig-Pineapple Marmalade — To 6 cups figs ground through food chopper, add 3 cups cut or shredded pineapple and 6 cups sugar, 1 large lemon or 2 small ones ground. Mix well together and cook in covered granite or aluminum pan in the oven just long enough to thoroughly sterilize it, for too long cooking destroys the delicious flavor so characteristic of this marmalade.—Mrs. Clara Schrack, Valley Springs.

Preserved Figs—Wash and weigh figs. To each pound add ½ pound of sugar and enough water to make the figs float and vinegar to make it a little tart. Five pounds figs 2½ pounds sugar, 1½ quarts water, 1 cup vinegar, 1 tablespoon whole cloves, 1 stick cinnamon. Cook one hour and let stand until next day. Turn figs well and cook one hour the second day. Third day cook until the syrup is thick. They can stand until cold and if syrup is not thick enough, cook again. Take out cinnamon and put in fresh pieces top and bottom of jar.

Candied Figs—These are different from any candied figs we ever saw or tasted—and the best ever. Samples brought in to the Cultivator office aroused much enthusiasm and invariably brought from the lucky tasters request for the recipe. The figs are very tender, clear amber in color and jelly like in consistency, the seeds are not hard and barely noticeable, one gets a real taste of the fresh fig. Here are the directions—and they are very simple:

Slit skins, soak figs in salt water 6 hours, drain thoroughly, rinse if very salty. Make syrup in proportion of 1 cup sugar to 1 cup water to 1 pound fruit. Cook figs in this syrup 1 hour, handling gently and boiling gently so as not to break the skins. Don't stir. Let stand over night and cook another hour. Take figs out of syrup, spread on platters or waxed paper and let drain off and dry for two days. The usual directions call for drying in the sun for a longer time, but these soft figs are vastly more attractive to most palates. Also it was found that it was better not to dry in the sun as this made them too hard. Roll in granulated sugar.

---

Greatest earthquake of record occurred at Krakatoa, between Sumatra and Java, August 27, 1883 .

---

Sea water weighs 64 pounds per cubic foot.

---

Dr. W. H. Walker, president of the California Farm Bureau Federation, returned July 5 from a trip to Washington and Chicago. Dr. Walker went to Washington to help the Imperial County farm bureau put across the Boulder Canyon Dam project, and he attended an executive committee meeting of the American Farm Bureau Federation while in Chicago.

### CALIFORNIA COOPERATIVE CANNERIES CLOSES 1921 SEASON

Final statement of returns for the season of 1921 have been mailed to the growers by the California Cooperative Canneries. Over $200,000 has been paid out to the growers within the last two weeks.

The statements to the growers show a profit above the prevailing prices paid by commercial canners ranging from 10 per cent on freestone peaches and apricots to nearly 25 per cent on pears and cling peaches. The average prices returned on the entire delivery of each variety are: Gooseberries, 7.02 cents per pound; Royal Anne cherries, 7.06 cents per pound; apricots, $61.70 per ton; free peaches, $34.24 per ton; cling peaches, $48.50 per ton; pears, $75.86 per ton; plums, $37.84 per ton.

The method of grading used by the Cooperative Canneries gives a different return to each grower, who is paid in accordance with the actual pack of canned fruit obtained from each delivery as shown by a sample made as each load is received. This sample is carefully prepared and graded according to the grades of canned fruit. The average prices returned as listed above cover the entire delivery of each variety including any fruit which commercial canneries would grade No. 2 and pay half price.

The better deliveries brought prices considerably higher than these averages, and therefore in comparing with commercial prices for No. 1 fruit these high grade deliveries must be used to give a basis of comparison fair to the Cooperative Canneries.

In the case of Royal Anne cherries the highest return was 8.44 cents per pound while seven growers received returns of 7½ cents or better. The highest commercial price paid in 1921 was 6 cents in the Santa Clara Valley with an average of not over 5½ cents throughout the state.

On apricots despite the very poor quality of the fruit, owing to the excessive hot weather which prevailed early in the harvesting season, the average price paid by the California Cooperative Canneries in the Santa Clara Valley exceeded the price of $60 generally paid by commercial packers for fruit running 12 to the pound and free from sunburn and other defects. Two deliveries averaged above $70, while the lowest price paid was $52 for very inferior delivery. In Stanislaus County several of the best deliveries of Tilton apricots exceeded $70, one going as high as $79 which compares with a commercial price of $55.

Freestone peaches of No. 1 quality were brought freely at $27.50 and $30 in 1921, comparing with $34.24 average by the Cooperative Canneries. The best deliveries of the variety brought a return of slightly over $40. Deliveries containing a large proportion of No. 2 fruit averaged below $30 or about the price paid for No. 1 fruit on commercial contracts.

Cling peaches opened in 1921 at $35, and this price was paid for a large part of the crop. As the season advanced some canners, finding themselves short of fruit, bid the price up to higher figures, but the average paid was not over $40 for No. 1 peaches, 2¼ inches in diameter. The average of $48.50 returned on all of the fruit both No. 1 and No. 2 shows a handsome profit to the cooperative growers. One grower in the Visalia district who delivered exceptionally fine fruit received $65.48 per ton while many returns were in excess of $50.

The pear growers of the Cooperative Canneries were particularly fortunate. The pack made last year was of exceptionally high quality and the average price for the entire delivery including the No. 2 pears delivered was $75.86. The deliveries of No. 1 pears averaged generally over $80 and one grower reached the high figure of $91.

Altogether the growers who delivered their fruit to the California Cooperative Canneries were well repaid for their cooperative effort.

The coming season of the California Cooperative Canneries promises to be one of increased activity with all plants running at full capacity. A heavy pack of apricots, cling peaches and pears, will be made and several new lines will be added to the products packed. The success of the California Cooperative Canneries during the past three years during two of which general conditions have been very adverse to the canning industry as a whole proves that properly organized the growers of California can successfully engage in the canning and marketing of their own fruit.

### SOUTHERN CALIFORNIA CITRUS INSTITUTE AND PEST CONTROL SCHOOL JULY 14-15

Sessions will be held at Pomona in the auditorium, Y. M. C. A. Bldg., North Garey Avenue.

**Citrus Institute, July 14**

The general subject discussed at the institute will be frost protection.

10:00 A. M.—Extension Movement and its Relation to the Citrus Grower, Robert W. Hodgson, farm advisor, Los Angeles County. The Farm Bureau and the Citrus Growers' Department, W. S. Rosecrans, Gardena, president Los Angeles County Farm Bureau. The Conditions which Occasion Injurious Freezes in Southern California Citrus Districts, Floyd D. Young, United States department of agriculture weather bureau. Frost Protection at the Rancho Sespe, Howard F. Pressy, superintendent Rancho Sespe.

### WHAT OF DRIED APRICOTS?

Though the California apricot crop will be slightly larger than the one grown last year, the dried tonnage will probably be less, according to officials of the California Prune and Apricot Growers Association. Last year's dried tonnage amounted to about 25,000,000 pounds.

The high prices being paid by the canners and green fruit shippers for this year's crop is responsible for the small tonnage of dried fruit expected. A heat wave during the height of the ripening season would result in a much larger production of dried apricots than is now estimated, as hot weather would ripen the fruit so rapidly that it would be impossible for the canners to handle the fruit.

Exceptionally high prices are being paid for future dried apricots owing to the prospects of a small production, according to H. G. Coykendall, general manager of the association. The California Prune and Apricot Growers Association, the growers state wide, non-profit marketing association which handles 75 per cent of the dried apricot production of the state, has temporarily withdrawn from the market after selling a small proportion of the San Joaquin dried apricots which are first to be packed. Opening prices at which the association sold these apricots range from 17½ cents to 27½ cents per pound.

*Built to an ideal and not to a price*

The great quality limitation of the average pump is its price. Before the first casting is made its life usefulness is pre-determined by *price*.

Byron Jackson has become synonymous with quality because it has been the policy of this Company through the years to reverse this procedure.

Every pump, whether special or standard, is built to the ideals of quality, efficiency, dependability and economy. Then, and only then, is price computed.

De Laval Cream Separators have won 1091 grand and first prizes at all important expositions and fairs in the world during the past 40 years.

De Laval butter has won first prize at every meeting of the National Buttermakers Association, with but one exception.

# 51% ARE DE LAVALS

The overwhelming number of De Laval Cream Separators in use is proved in a striking and forceful way by three recent investigations conducted by disinterested people, covering most of the principal butter-producing states:

(1) From an investigation conducted by the **Purdue Agriculturist** (Indiana), **Iowa Agriculturist, Cornell Countryman** (New York), **Agricultural Student** (Ohio), **Penn State Farmer, Tennessee Farmer,** published by the students of the various agricultural colleges in question, and their readers, who received the questionnaire, are either graduates or former students:

64.8% use cream separators of the following makes:

50.6%—De Laval.
16.8%—Nearest competitor.*

(2) Sixty-two per cent of the cream separators on 388 representative Minnesota dairy farms, selected at random and over a wide area, are De Lavals, according to a survey recently made by **The Farmer,** of St. Paul.

De Laval—62%.
Nearest competitor—6.4%.*

(3) From the Dairy Farm Survey of **Hoard's Dairyman** (the foremost dairy paper in the world, having a circulation of approximately 85,000 at the time of this investigation).

**Have you a cream separator?**
80.00%—Yes.

**What make?**
41.18%—De Laval.
16.74%—Nearest competitor.*

51.26%—average number of De Lavals, based on the foregoing, which confirms the well-known statement that there are about as many De Lavals in use as all the rest combined.

The only reason there are so many more De Lavals in use is that it is the best separator—skims cleaner, lasts longer, and is easier to clean and turn.

*Names of all separators used and percentages given on request.

# Feeding Dairy Cows---No. 3

By E. J. Sturgis

## ADVANCED REGISTER TESTING

(Continued from last week)

AS soon as the cow shows signs of having an appetite begin with small feeds of the regular test ration which is composed of 200 pounds coarse ground oats, 200 pounds coarse ground barley, 200 pounds bran, 100 pounds corn meal, and 100 pounds linseed oil meal. Weighing the milk should begin the third or fourth day, but the official test does not begin until the morning of the seventh day at the milking nearest 6 a. m. The first seven days on test it is the general rule to make the cow produce as much butter fat as she can regardless of the amount of milk. It is the ability to feed a cow so that she does not increase in milk too fast and holds her high test that has made a success as short time testers for many men.

When the cow reaches the point of beginning test she should be on a fairly heavy feed of the test ration, and to it should be added soy bean meal and cotton seed meal acording to the amount she can handle. These last two ingredients are not incorporated in the regular ration but are added when the feed is weighed out, and the amounts may be changed at each feeding. Soy bean meal tends to make milk and should be used with care so that she does not increase in milk too fast and thus bring her test down. Cotton seed meal tends to hold the test nearly constant but is a powerful feed and should be used carefully.

### Seven Day Test

If the cow is naturally a big milker and is capable of producing over 100 pounds a day when on full feed she will probably be giving 75 to 85 pounds a day when put on test. If the average of this milk for the day is around 4.5 per cent, feed eight pounds of the test ration with not to exceed three pounds of soy bean meal and one and a half pounds of cotton seed meal a day. If she is milking 100 pounds and testing 4 per cent give her 10 pounds of the test ration with four of soy bean and two of cotton seed meal. With these rations feed 10 to 20 pounds soaked beet pulp a day and plenty of alfalfa.

Watch the average per cent of the test for the day very carefully. Do not worry about the separate milkings as they vary considerably and it is the average for the day that tells the tale. Be careful not to throw the cow off feed and especially if she is to be continued on year test. If she begins to increase rapidly in milk and of course go down in fat per cent within 36 hours of the end of her seven days you can discontinue the regular ration and feed a small amount of bran and oil meal and as much cotton seed meal as is safe to give, which is not more than eight pounds a day. This will tend to hold the test up until the seven days are completed. It is not safe to keep her on this kind of feed for more than 48 hours.

### Thirty Day Test

If it is desired to continue the cow for a 30 day record, keep her on the test ration with soy bean and cotton seed meals, increasing slowly at the rate of one-fourth pound of feed to one pound of milk gained. At the end of the 30 days if she is milking 100 pounds a day she should be getting from 20 to 24 pounds of grain. One often hears stories of cows which eat from 30 to 40 pounds of grain a day on tes but it is seldom that cows fed that way have made large year tests. Be conservative in your feeding and the results in the long run will more than justify your restraint.

Cows which have finished seven and 30 day records should be in condition to go ahead and make year records. Use the regular test ration, feeding one pound to four or four and a half of milk, according to the condition of the cow, easy feeders getting the smaller amount. Carrots, beets and silage may be fed to cows on test with good results, but my experience has been that it is better to rely entirely on soaked beet pulp and green alfalfa for succulence. Do not feed cotton seed after the end of the 30 day test.

### Care of Test Cows

A cow on seven day test should be in a box stall with a small paddock for exercise if possible. She is allowed a light blanket to guard her against sudden changes of temperature. Heavy blanketing and sweating is against the rules and should not be attempted. The cow is not to be given medicine unless she is sick and then only by a veterinarian who supplies a statement of its contents. It is allowable to give salts to a cow suffering from the binding effects of the cotton seed, until action is again established.

The year test is a long grind for the cow and a change of ration occasionally helps to keep her appetite keen and condition good. Now and then cut out the test ration for one feed and give a feed of oats and bran or whole oats in its place. If she slows up at any time reduce the amount of her feed until she is hungry again and then increase slowly until she is on full feed again.

### 305 Day Test

Because it takes in a period much the same as the lactation period of the ordinary dairy cow the 305 day test is highly favored by many breeders. This test is not complete until the cow has dropped her second sound calf within 14 months of the birth of the one with which she began test. Breeders figure that the 305 day test allows them to get a maximum production from the cow and still have the offspring at the regular time. One of the chief objections to the 365 day test is that in order to have the cow continue with her high production, many are not bred until late in their lactation periods and so do not have the second calf until 18 to 20 months after the first one. For 305 day records the cow should be bred the first heat before the middle of the fourth month after calving. If she fails to conceive at this breeding you will have two or three further chances which will still bring her within the 14 months. Cows on yearly test should be bred first in their fifth month.

## PACIFIC SLOPE DAIRY PRODUCTS SHOW AT FRESNO

The plans for the Pacific Slope Dairy Products Show started with a bang on Thursday of last week, when representatives of the dairy industry, including California Dairy Council, dairy supply men, newspaper men, and the college of agriculture, met at the Commercial Club in San Francisco to make final arrangements for the holding of this show. Great enthusiasm was shown and pledges of support offered by all present with a view to making this show a rousing success. Every branch of the industry will be called upon to give its support.

Fresno has been selected as the place for holding the next show, and because of its location near the center of population in the state, it is believed that it is the logical place for the show this year. Fresno is a convention city, and the great city auditorium is admirably arranged for holding this show and for the meetings of the various dairy organizations.

All branches of the dairy industry will be represented. The butter manufacturers expect to have a moving exhibit of the modern process of manufacturing butter; the milk distributors will show the complete process of milk handling from the dairy farm to the package for city delivery; the ice cream manufacturers will have a moving exhibit showing modern methods of manufacturing ice cream, and the cheese industry will be expected to show the complete process of cheese manufacture. The dairy industry division of the University of California has started plans for showing the progress of dairying in the past 50 years. Arrangements have already been made for collecting a

large supply of equipment which was used on dairy farms in California 50 years ago. Every dairyman in the state will be interested in this exhibit.

The machinery interests have already agreed to fill the exhibit space with equipment of every description that is used in dairying. The milk powder manufacturers, condensed milk manufacturers, milk sugar manufacturers, and all other dairy institutions will be represented.

By means of committees offering their services to assist with the organization, dairy interests of the state will be given an opportunity to join the ranks of the workers who have pledged themselves to make ths show the greatest of its kind that has ever been held west of the Rocky Mountains.

The California Dairy Council has accepted the resposibility of putting on a "Dairy Week" at Fresno during the show. The various features will be of interest to all dairymen. Special literary and musical programs will be arranged on different days, detailed announcement of which will be given later.

The dairy producers and manufacturers of the state should set aside the dates of November 13 to 18 and offer every aid in support of the industry.—C. L. Roadhouse, Manager Pacific Slope Dairy Products Show.

# Dairying in California

By A. M. Robinson, Dairyman, Davis

THE outlook at the present time presents to the farmer of moderate means a splendid opportunity to break into the dairy business as the price of dairy cows at present is lower than it has been in years and lower than it probably ever will be again.

The dairy farmer is weathering the financial gale better than the promoter of any other line of agricultural endeavor for the reason that there is a ready market for his products and he receives his returns on a cash basis semi-monthly. This gives him the advantage of having cash on hand to carry on his business.

There is no state in the Union which offers a greater inducement to the man of small capital than California. From every standpoint the conditions are ideal and unexcelled. It is a grass state and this, combined with the highly favorable weather conditions, makes it possible to raise feed of every kind abundantly and at the lowest cost as compared with other states in the Union. Our mild weather proves to be another abvantage as it is not necesary to keep the dairy herd housed during the winter months.

### Provides Good Investment

There is no other business that gives to the investor a better guarantee of interest on the investment than does the dairy cow. Every time she produces a calf it is worth from $10 to $15 at from two to four weeks of age, making a return of 10 per cent on a $100 investment, the value of the mother. If it is a wellbred heifer calf of high grade it would be a conservative estimate to state that it would be worth at two years of age all the way from $75 to $100, according to her breeding, allowing a reason able sum for milk, pasture, and hay. It can be readily seen that there is a good profit above the expense of her raising. There is also another advantage, namely: that of keeping the original investment replenished from the heifer crop. If at any time the investor desires to quit the business he can always sell out for more than the cost of his original purchase. The difference of profit largely depends on the quality of his cows. If he has used good bulls upon his herd, the offspring naturally bring more money. It is to the advantage of every dairyman to use the highest record purebred bull he can afford and at the present time wonderful young bulls can be bought for a comparatively small price.

### Land Necessary

The average amount of land necessary for the maintenance of a one-man dairy is from 30 to 40 acres. This will allow him feed to maintain a herd of from 15 to 25 cows, as well as providing feed for his heifer crop. If he desires he may increase that herd to 30 cows, but this would all depend upon the character of the land and its ability to produce feed. By the addition of a silo more cows can be kept, due principally to the fact that larger quantity of feed can be produced on the same given amount of acreage than could otherwise be produced without it. There is nothing connected with the dairy business that renders a greater return than does the silo, as it furnishes a succulent feed at that period of the year when it is most needed, increasing the yield when the prices are high. This factor alone makes it the greatest asset in the whole dairy equipment.

### Cooperative Marketing

There is another feature that is all important, the marketing of the product, California, being the pioneer state in cooperative organization, has seen to it, through its state market director under the supervision of the director of agriculture, that the dairymen of this state became organized for the purpose of eliminating waste, manufacturing by-products and selling directly from the producer to the consumer, thus destroying cutthroat competition and speculation. By being rightly organized the dairymen have been able to properly standardize their product, improving the quality, and by proper methods of marketing and distribution, have been able to increase the demand for all kinds of dairy products. The method under which these organizations operate is through the cooperative non-profit system under which the actual cost of manufacture and distribution only is deducted, returning to the dairymen the remaining proceeds from the sale of all products. By perfected methods of distribution they have been able to keep the markets of the state free from glut, thereby increasing the demand to such an extent that the prices of dairy products in California the past year have been higher than in many other states. Under these conditions the dairy farmer has no marketing problem to solve individually, and besides the marketing end of the business we have one of the greatest educational institutions in the United States, the University of California, which works out many problems of vital importance to the dairy industry. Any information that the dairymen need as regards proper feeding or the husbandry of dairy cattle will be fnrnished for the asking.

### State Help

Information relative to all contagious or infectious diseases of dairy cattle is supplied to the dairymen by both the division of animal industry of the state department of agriculure and the University of California. The enforcement of the various dairy laws is delegated to the state department of agriculture at Sacramento, and the prospective dairyman is urged to thoroughly inform himself of these various regulations. Strict compliance with these laws is most essential to the production of high class dairy products. California is lending every assistance through the different departments to help the dairy farmer solve his problems. It is protecting him against failure, stabilizing his business to the extent that for the amount of money and labor invested there is no other investment that is as secure and will guarantee a better return than the dairy business.

## GUERNSEYS AUCTIONED AT RIVERSIDE

There will be a sale of 46 head of registered Guernsey cattle: 36 cows, six heifer calves and four bulls, at the fair grounds, Riverside, on the afternoon of August 4. This is a cerefully selected draft from the well known Claremont herd, owned by L. D. Smith of Hydeville, but formerly of Berkeley, where the herd was founded 11

PAPEC seemed most practical"

COMPARISON of the Papec Ensilage Cutter with other cutters is invited. Before you purchase a Papec we hope you will look at as many cutters as possible, just as the rancher did who made the above statement.

Comparing the Papec Ensilage Cutter with others brings out the following practical features:

One-piece, solid, semi-steel frame;
Elevates to the height of any silo at 600 r. p. m.;
Cuts 3 to 30 tons per hour;
Perfect knife clearance;
Six fans on the cutting wheel instead of three or four;
Ensilage cannot clog the pipe.

Simplex Silos have advantages over other silos, that are as important as the advantages of the Papec Ensilage Cutter over other cutters.

SANTA FE LUMBER CO.

16 California Street, San Francisco, California

*Fill out and send in the coupon.*

In the meanwhile compare both of these products with others in the same line.

Tear Here

## You Should Not Buy a Bull Unless:

You have seen his dam and know that she is the type you want his daughters to be.
Or you have seen a good picture of her with a close-up picture of her udder.
She is a big producer of milk with a high percentage of fat.

Our cows are the tops of all the big sales in the state for the past three years.
Practically all of them have high 7 day and yearly records. They hold 4 world's records. Our herd bull is Sir Aaggie De Kol Mead, whose five nearest dams average 1130.66 pounds of butter in a year testing over 4%.
You should have one of his sons out of a high record dam.
Call or write for our long-time, easy payment plan.

Lankershim, Cal. Fred Hartsook Ranch

Visitors always welcome.

## DIAMOND G HEREFORDS

13 choice yearling heifers, sired by a son of an International Champion, well grown and just the sort for starting a profitable herd. Also 10 yearling bulls. Come and see them; the price is right.

H. H. Gable Esparto, Cal.

**The California Cultivator is only One Dollar Per Year.**

## Big Money Boring Wells

Have water on your own farm. In spare time make wells for your neighbors. It means $1000 extra in ordinary years, double that in dry years. No risk—no experience needed.

**Outfits for Getting Water Anywhere**

Earth augers, rock drills and combined machines. Engine or horse power. *Write for easy terms and free catalog.*

LISLE MFG. COMPANY
Box 716 Clarinda, Iowa

years ago. At the present time the herd numbers 150. On account of a fire that destroyed the main barn and a large quantity of feed it becomes necessary to reduce the herd, hence this offering. Much of the cream of the herd is being offered, every animal has recently stood the tuberculin test and they come from a herd that is absolutely clean. These cattle are bred as good as the best, are in fine breeding condition and will creditably account for themselves in the future.

Sale is under the management of the Pacific Pure Bred Sales Company, C. R. Thomas, sales manager, 808 Santa Fe Building, San Francisco. Catalogs will be ready July 20.

---

The bureau of markets will close its office today, July 15.

# Give Your Cows a Chance

## Help Them Make Money for You

Don't handicap them by giving them dry, withered feed that has no milk possibilities in it.

Give them nourishing, juicy, milk-producing silage, the kind that comes from an

# Ideal Green Feed Silo

By the use of the Ideal Green Feed Silo you have the advantage of green pasturage during the winter months—the time when dairy produce is at its highest price.

The Ideal Green Feed Silo will pay for itself every season, and possibly twice a season. It is the most economical investment you can make on your dairy. Built of clear, dry redwood—the everlasting wood—and held together with hoops of steel. Fitted with refrigerator doors.

Let us tell you about this wonderful silo. You need our booklet on silage. We'll send it FREE for the asking.

# SHORTHORNS

## at Public Auction

### Carruthers Farms, Live Oak, Calif.

### Wednesday, August 9, at 1 P.M.

In this offering the owner, Mr. W. M. Carruthers, comes close to realizing a long cherished ambition—to make a public sale offering of high class Shorthorns of his own breeding. With a very few exceptions the choice cattle in this sale were all calved on Carruthers Farms.

**31 Heifers in the Sale**

Mr. Carruthers is selling all of his heifers older than calves at foot, practically all of Scotch pedigree and including some real show ring prospects. Both bred and open heifers make up the group, presenting a most attractive selection of foundation material.

**Some Choice Cows Will Sell**

A limited number of choice cows will round out the female offering, some with calves at foot, others well along with calf.

**11 Choice Bulls in the Offering**

Of the eleven choice bulls to sell, about half are ready for service, the balance well grown calves. Some show prospcts among them.

This is conservatively one of the most attractive Shorthorn offerings made in California. Guaranteed breeders and tuberculin tested.

TERMS OF SALE—The sale managers will extend the usual terms of one-half cash, balance in six months, to responsible parties who arrange for credit before sale.

### AGRICULTURAL FAIRS

**By Prof. E. H. Hughes, Davis**

The livestock producers of our state at this time of the year are looking forward to the time when their livestock will be exhibited at the various agricultural fairs. It is a time when men are looking over their herds rather carefully and selecting the individuals that will make up their show herds. They are paying a little more attention to the feeding operations; they are exercising their animals and are generally shaping things up in such a way as to make a creditable showing when they meet the competition of the other fellow.

Our agricultural fairs are places where the state livestock and other products are on exhibition. Fair time is when men can compete in a free fashion for the blue ribbon; where type is set. Before and after the animal has been taken into the ring they discuss ways and means of producing better livestock, developing better markets, setting new and higher standards for the future. It affords the public an opportunity of seeing approved types of livestock and of learning more about livestock products. It affords an opportunity for the producer to sell, and for the public to buy. In other words, the producer who exhibits at the state and other agricultural fairs has an excellent opportunity of placing before the public the stuff he has for sale, and it is one of the best means of advertising we know of. It means a lot of extra effort in the way of feeding and care before the show, and while on the circuit it means long hours cleaning up, caring for the stock, loading on trains, going without meals and moving to the fair grounds and back to the car again. However, it is a time when men can swap ideas, gain inspiration and develop higher standards of attainment for the future.

## Livestock News Notes

The Berkshire Breeders of the Pacific coast will be interested in the results of E. J. Barker's sale held at Thornton, Indiana, June 15. Forty head sold for an average of $144, with a top of $240, which indicates that good foundation animals can be purchased at very reasonable figures and can be sold by the breeder at a very good margin of profit. The results of this sale should be an inspiration to the breeders on the coast to do likewise.

---

Most of the swine breeders that will show this fall have their show herds in preparation. The excessive heat of the summer months must be guarded against, and some of the best fitters of show herds recommend sand baths. This is accomplished by placing sand under a shade and keeping it moist with water but never letting it get into a mud mole. Mud holes are never healthy and should be avoided.

---

What the hog has accomplished for the corn grower of the Middle West the past winter he would have accomplished for the barley raiser of this state, if given the opportunity. With cash corn at about 25 cents per bushel fed to hogs it was worth from 75 cents to $1.00 per bushel. With barley at a dollar to a dollar fifteen it would have brought double fed to hogs. For 50 years hogs have been the backbone of Midwest farming; let it be the same in California.

---

On August 9 W. M. Carruthers will hold a sale of Shorthorn cattle at which time he will offer about 50 head, most of which have been bred and raised on his farm. The sale will be held on the farm just north of Live Oak, under the management of the California Breeders Sales and Pedigree Company. Ben A. Rhoades of Los Angeles will be the auctioneer.

---

In a statement made by R. V. Wright, farm management specialist of the University of California's agricultural extension service, dairy farmers made the best showing, making 7.7 per cent interest on their investment.

---

Many farmers who make livestock part of their operations are awakening to the fact that good females are just as essential as good sires. Often the remark is heard that the sire is half the herd, and with many this is a deliberate attempt to overcome the shortcomings of the females in the herd. The sire may have the same defects as the female and the mating of the two only tends to intensify the defects. There is no question that a good sire will improve any herd, but the better the females the greater the improvement.

---

The records of the United State department of agriculture which conducts the Better Sires-Better Stock campaigns, show that the interest in pure bred sires is more than double that of last year. There is increasing evidence, declares Dr. J. R. Mohler, chief of the bureau of animal industry, that raising scrub livestock is an unnecessary waste of time and feed. Any livestock owner can improve the quality of his stock by the better sire route. Purebred sires permit the raising of grades, crossbreds or purebreds, whichever is preferred, depending on the kind of females used. According to reports from more than 500 livestock owners who have used purebred sires for several years, the greater returns derived greatly exceed the initial outlay and the benefits accumulate with each generation of animals raised.

---

An Illinois farmer who operates a quarter section farm on the share basis raised 2200 bushels of corn last year. He fed his half to purebred hogs, sold $1208 worth of hogs and has seven sows, 25 fall pigs and two bears left. By feeding his corn to purebred hogs he realized about $1.17 per bushel while the landlord sold his share for 45 cents a bushel. What will purebred hogs do for the grain raisers of California?

---

Now is the time of times to cull and improve farm herds and increase the holdings of good stock on the farm, says Dean C. F. Curtiss of the Iowa state agricultural college. There have been abundant and conclusive demonstrations showing increased returns of 25 and 50 and even 100 per cent over selling grain or inferior animals. Present economic conditions make it imperative that the farmer take advantage of every method that will increase profits.

---

County agents, bankers and farm bureaus should join in campaigns to help farmers stock their farms with better stock. Unless agriculture gets the full import of this lesson out of present depression the great basic industry will not fully recover or enjoy the full measure of prosperity.

## BEE LOCATIONS AND HONEY PLANTS OF CALIFORNIA

(Continued from Page 53.)

So comes the migratory beekeeper who moves his bees from place to place following up the flow. The coast belt makes a good starting point. The willow, eucalyptus, alfilaria, mustard and other early vegetation start off early brood rearing. The orange belt furnishes the first chance of the season for surplus honey. The next hop is into the sage, then back to the beanfields for the summer and fall. Many Utah and Idaho beemen ship by rail to and from Southern California to take advantage of the early spring for increasing, also to avoid the heavy losses of their vigorous highland winter. The auto truck is the favorite means of transportation of our local migratory beekeepers. It must not be inferred from the above that migratory beekeeping is universally practiced. Many yards are permanently located in the foothills. Their owners prefer to take their chance of a crop in one place thereby avoiding the expense and labor of frequent moves, which is no small item.

Summing up I want to emphasize a few points. In selecting a wild range give preference to the north slope; other things being equal it will not dry out so quickly. Water should be reasonably near, say within a half mile or closer. Precautions should be taken against fire after the grass becomes dry.

In selecting an alfalfa range bear in mind that you must get over the coast range away from the salt air.

## STRICT COTTON QUARANTINE

A program of strict enforcement of the quarantine against cotton or cotton seed from states infested with boll weevil was decided upon at the special meeting held at Riverside by the state department of agriculture.

Imperial valley was represented at the meeting by Secretary R. B. Corcoran of the chamber of commerce, County Horticultural Commissioner Waite, Argyle McLachlin and O. A. Pratt, federal inspector at Calexico.

Under an agreement reached at the meeting, Riverside and Imperial Counties will share with the state the expense of stationing inspectors at Yuma bridge, Blythe and Daggett, the three gateway points into Southern California from the east.

These inspectors will be charged with the duty of inspecting every vehicle that enters the state to prevent the introducing of the boll weevil or worm into California.

Daggett was selected as a station so that the inspector could cover the three routes converging at that point; the Parker route, the Santa Fe trail, and the road from Nevada.

Other measures to be taken include strict supervision over seed brought into California from Arizona for milling purposes. All box cars carrying this seed must be disinfected immediately after unloading at the Los Angeles mills.

## CALIFORNIA HAS CHEAPEST POWER

"The intensive research compilations that have been undertaken by the Journal of Electricity and Western Industry bring out one forceful and encouraging conclusion to western users of electrical energy in the Pacific and Mountain states, the 11 Western states of America, that they enjoy the cheapest power rates prevailing anywhere in the nation. On the basis of the cost to the consumer per kilowatt hour generated, the rate in the different sections of the nation are as follows: New England states 2.82 cents, South Central states 2.65 cents, Atlantic states 2.09 cents; North Central states 1.82, Pacific and Mountain states 1.57 cents, with the average rate of California as reported by the California railroad commission of 1.42 cents per kilowatt hour. Thus the average rate for the United States as a whole is 2.17 cents, while the average rate in the Pacific and Mountain states is 1.57, with California showing the lowest rate of all, 1.42 cents.

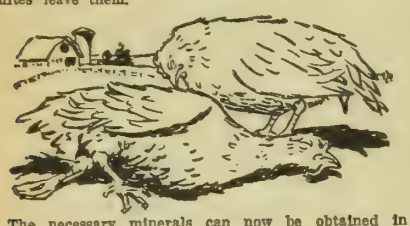
**800 Angora Goats** priced for quick sale. C. E. Bryant, Three Rivers, California.

# Lice Kill Chickens in Warm Weather

**Summer Months Most Dangerous, Says Poultry Authority—To Prevent Losses Add Minerals to the Fowls' Drinking Water**

If your chickens are sickly, won't lay and are dying off in hot weather, lice and mites are probably the cause. Dr. B. F. Kaupp, famous poultry authority, says: "Lice are most common in July and August. During these months conditions are more favorable for their propagation." To easily get rid of these pests and prevent losses, add minerals to the fowls' drinking water. This does away with greasing, dusting, spraying and dipping. Soon after the fowls drink the mineralized water all lice and mites leave them.



The necessary minerals can now be obtained in convenient tablets, known as Paratabs. They are scientifically prepared, perfectly safe, and dissolve readily. The tablets also act as a tonic conditioner and are warranted to impart no odor or flavor to eggs or meat. They are equally beneficial to young chicks and grown fowls. The health of the fowls improves, they grow faster, stand hot weather better, and the egg yield frequently is doubled. Mrs. M. N., Pulaski, Ky., says: "I am giving Paratab water to my chickens and am having better luck this year than ever before."

Any reader of this paper may try Paratabs without risk. They cost only a trifle and are sold under an absolute guarantee. Furthermore, the laboratories producing Paratabs are so confident of good results that to introduce them, they offer two big $1 packages for only $1. Send no money, just your name and address to the Paratab Laboratories, Dept. 959, 1100 Coca Cola Bldg., Kansas City, Mo., and the two $1 packages, enough for 100 gallons of water, will be mailed. On delivery pay the postman only $1 and postage. If not delighted with the results in 10 days, notify the laboratories and your money will be refunded in full. Don't hesitate to accept this test offer, as it is fully guaranteed.

# Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. # Speeding Up Production

By M. A. Schofield

THE speed with which food passes through the digestive tract of growing chicks is the determining factor of failure or success. Any time that partially digested food lies in the digestive tract for a few hours more than the normal period, such chicks are in danger of a setback, if not a serious attack of disease. There is little danger of serious loss as long as the food stream is kept moving rapidly, but when the food stream moves slowly, all the parasites and harmful bacteria which affiict our growing poultry begin their ravages with a ten-fold virulence, and it can be said that chicks with a slow digestion are almost sure of an early grave. Many of them at least.

### Overfeeding

From the beginning of things we have been taught that we must not overfeed our chicks. This is good advice and aims at the same idea expressed above. The difficulty is that overfeeding is a relative term; therefore, what might be proper feeding with one lot of chicks or the proper amount of feed on some one day might be entirely too much for another lot of chicks fed on some other day. The ability of chicks to digest food rapidly varies under the influence of environment; but in any event, even though the chicks are fed but half the usual amount, we must maintain rapid digestion if we expect to raise a profitable percentage. The muscles of the gizzard and intestines may become so weakened from over distention and from unnatural fermentation that in extreme cases it is utterly impossible to restore normal strength and elasticity to these and other organs. Chicks in good health and growing rapidly digest their food at great speed. We say they are always hungry, which means that in three or four hours after feeding their crops are empty once more. Chicks fed practically all they will eat at 5 o'clock are empty or nearly so by midnight. It is not necessary for them to have the entire night to digest their evening meal, but they have largely disposed of it before the night is one-half over. Growing chicks digesting their feed with such speed are in little danger from harmful bacteria and parasites.

### Favorable Environment

As a foundation for all brooding the successful poultryman realizes that comfort is the prime essential. That is, the heat must be at the proper degree; there must be sufficient fresh air; the brooder must be kept reasonably clean; and the drinking water fresh and uncontaminated; the food sound and free from mustiness or taint. Given good comfortable surroundings, we will then discuss how to maintain a rapid movement of food.

### How to Induce Rapid Digestion

As a general classification we believe that such agents may be divided into three: First—those food products which build up the muscular system of the chicks so that the foundation is properly laid. Among these agencies might be mentioned exercises and the proper use of milk solids. Possibly green feed should be mentioned at this time, because the benefit of green feed is probably two fold. One, to supply the necessary vitamines; and second, mechanically, its use starts a free movement of the chick's bowels. No argument is needed to prove that natural conditions of health can only be maintained where the chicks have strong muscles, hard and compact, not only externally, but also internally. In other words, the machinery itself must be in good running order, if the food is to pass through in record time. A great deal has been written warning us to keep the chicks from getting chilled or overheated, and for this reason the average poultryman understands what a bad effect either extreme might have on digestion.

### Two Ways of Speeding Up Digestion

The first of these is mechanically; the second, by the use of drugs. Mechanically speaking there are at least two agents which tend to speed up the digestion of the chick. They are fine sand and crude fiber. As a rule it pays to wash the sand before we feed it to the chicks although this is not absolutely necessary. The sand is mixed in the dry mash. Some authorities say that in extreme cases 25 per cent of the chick mash may be fine sand. Five or ten per cent is usually sufficient. Those who have never tried the use of sand will be surprised to note the acceleration it will give the movement of the mash feed with chicks that are still in a normal condition. One of the best chick starters that ever came to the Pacific coast was composed of 25 per cent of very fine sand; the remaining 75 per cent, however, was of very high grade material.

You will note that the second of our mechanical agents is crude fiber. A great deal depends upon the fineness to which the fiber is reduced. Large pieces of fiber are very apt to be detrimental because they injure the delicate membranes inside the chick. The hulls of oats and barley, for example, must be fine ground to serve their purpose properly. As a laboratory experiment, 10 per cent of blotting paper has been ground to a powder and added to the chick's ration to accomplish the same end. Those writers on poultry feeding who teach that chicks should be fed a ration very low in fiber, are going off on a tangent in the opinion of a great many of those most successful in brooding their chicks. We mention a second time, that fiber should be finely ground. This also stimulates the muscles of the digestive tract, to hurry the food forward. Flaky bran has also been recommended by many. However, the bran has at best 10 per cent fiber, whereas the ground hulls are from 30 to 40 per cent fiber. The bran, of course, has valuable nutrient property not possessed by the ground oat and barley hulls. As a source of crude fiber to induce rapid digestion, flaky bran is not equal to the others.

### Green Feed

We suggested above that green feed among its many advantages has two which are outstanding: In the first place, it supplies those growth elements which we call vitamines; and in the next place it has a mechanical use which increases the forward movement of the food. It is not only a laxative, but the fiber which is not in a harsh condition like the ground hulls, also tends to produce a progressive movement. We all realize, if we have attempted to raise baby chicks, that green feed is one of the most important on the chick's menu.

### Epsom Salts and Lactic Acid

To secure a rapid movement, many poultrymen resort to giving the chicks at intervals a more or less severe physic. Some use epsom salts and some a high percentage of lactic acid. Both of these agencies are used with success. Unless followed by rational feeding, the effect is only temporary and things soon revert to the condition which prevailed at first. Used to excess, any physic tends to derange the healthy action of the digestive machinery.

# Poultry Queries

Conducted by Jean A. Koethen

### Lame Hens

Apparently healthy hens commence to limp and never get any better. They usually have bowel trouble and die after a time.—Subscriber, Potter Valley.

Limping is sometimes rheumatic, but if it is accompanied by emaciation, "going light" it is often called, tuberculosis may be suspected. If a number in the same flock are affected in the same way, becoming lame and gradually losing flesh till they finally die, tuberculosis may be almost certainly diagnosed, though a bacterial examination is the only absolutely

HERCULES MFG. CO.
CENTERVILLE, IOWA

certain proof. There is no cure for tuberculosis. The only treatment is to kill and bury or burn every affected bird as soon as its condition is noticed, to clean and disinfect every part of the premises thoroughly, or, if possible, to move to new ground.

### Cholera

What is the cause of a yellow bowel discharge? Hens are sick for several days before dying.—Subscriber, Potter Valley.

That yellow excrement is characteristic of cholera. Dr. Salmon says: "The earliest indication of the disease is a yellow coloration of the urates or that part of the excrement which is secreted by the kidneys. This in health is pure white, though it is frequently tinted with yellow as a result of other disorders than cholera. Generally diarrhea is a prominent symptom. Excrement is voided frequently and has a deep yellow color, which in the later stages of the disease may change to greenish or even a deep green. Very soon after these symptoms appear the bird separates itself from the flock, it no longer stands erect, the feathers are roughened or stand on end, the wings droop, the head is drawn down toward the body and the general outline of the bird becomes spherical. At this period there is great weakness; the bird becomes drowsy; the crop is nearly always distended with food and apparently paralyzed. There is in most cases intense thirst." Genuine fowl cholera is considered incurable, though Dr. Beach has found that a tablet of bichloride of mercury dissolved in the drinking water helps, at least, to control infection, and may be of some relief to the affected bird. The solution should not be stronger than 1-5000, and I should not like to use more than one tablet to two or three quarts of water. Dr. Salmon recommends either bichloride of mercury or a few drops of creolin in the drinking water. It is generally safer to kill all affected birds and burn the carcasses or bury them deep. Premises should be thoroughly disinfected with creolin or sulphuric acid.

### Fattening Chickens

How can I feed young chickens to fatten them? Should they have exercise or green feed? If they do not grow fat what is the reason?—Reader.

There are two ways of fattening cockerels for market. Poultrymen who have a great many to market find it worth while to build crates just large enough to hold six or eight birds apiece and to confine them in these crates while fattening. The advantage of crate feeding is that the birds are not able to move around at all and hence put on flesh rapidly. The crates have a slatted bottom, and must be kept in a cool, shady place. The ration consists entirely of mash moistened with sour milk if possible; if sour milk is not available water is used. When sour milk is used, the mash may consist of 50 pounds corn meal, 20 pounds middlings and 10 pounds ground oats. When the mash must be mixed with water add 10 pounds beef scrap to the ground grain. The other way of fattening, which is in more general use, is to confine the birds in a small pen, and feed moist mash twice a day, with cracked corn for the third feeding. A little green may be given. Crate feeding cannot be continued over two weeks, for the birds are apt to get off their feed if confined longer. The other method may be followed from the time cockerels are separated from pullets till they are ready for market, and is easier for both birds and feeder. If birds do not put on weight it is because the ration is not right or they have been confined too long.

### Mites Perhaps

Our six weeks' old chickens did well till a week ago. Now many of them stand around hunched up, drowsy and with rough feathers. Our feed is the best, yards and houses clean.—Subscriber, Garden Grove.

From the symptoms you give I suspect mites are at work on these chicks at night. Have you sprayed their coop regularly or painted with crude carbolic acid and kerosene? It is possible, of course, that coccidiosis is in the flock. In that case there would be bloody droppings. If you see such droppings, put the whole flock at once on a diet of sour milk, with a little grain night and morning. If you can put them on clean ground, so much the better. But look for mites and paint or spray whether you find them or not.

### Peafowls

I wish to keep a pair of peafowls on our eight acre ranch, and would like to know how to manage them. I thought of making an aviary covered with two inch wire and confining them for a time. Are they hardy, or do they have to have a house to roost in? Are they delicate or do they live a good many years? Can I keep grouse and prairie chickens in an aviary, and do they easily become domesticated? Can you suggest a nice aviary pet after the order of pheasants or ducks? —Subscriber, Fillmore.

I took this question to a Los Angeles aviary and learned that some of the nicest aviary pets are the Australian Crested dove, the Crown pigeon, the South American guinea, pheasants, which become very tame with proper care and the California Mountain quail. Peafowl are cared for exactly as chickens are in all respects, requiring the same feed and shelter and are very hardy. Grouse and quail may be caught and domesticated, but are not easily obtained otherwise.

### Fall Hatching

I am new in the poultry game and would like to know whether a fall hatch of White Leghorns will do as well as a spring hatch. What are the objections, if any, and why do not more poultry people prefer the fall hatch?—Subscriber, Arcadia.

The objection to fall hatching is a commercial one entirely. Chicks hatched in September grow splendidly and command the highest price for fryers and roasters in February, but the pullets are not as profitable for the simple reason that they begin laying in the decline of the season instead of at its height and must be fed longer before they pay for their feed. Pullets hatched in March begin laying when prices are near the top and begin to pay their way immediately. Pullets hatched in September begin laying in March when eggs are cheap and go into the molt just when they ought to be most profitable. This, I believe, is the objection in a nutshell. If one is short of pullets and anxious to save time he will do well to set all the eggs he can in August and bring off a lot of September chicks. If he has birds enough for the coming season he will do better to wait till February, which is, all things considered, the best hatching month in the year.

---

The Oregon Public Service Commission has fixed standards for hay. Alfalfa grades are: Choice, No. 1, Standard, No. 2, No. 3, no grade.

### STORRS EGG LAYING CONTEST

Storrs, Connecticut, June 27, 1922.—The hens in the laying contest at Storrs are easing off a little as compared with the excellent performance of a few weeks ago. In the thirty-fourth week the total lay for all pens was 3,660 eggs or a little more than 52 per cent. White Leghorns are expected to forge to the front at this season, and this is exactly what is happening. A pen of Leghorns owned by George B. Ferris from Grand Rapids, Michigan, was in first place for the week with a score of 55 eggs.

With the approach of summer, the poultryman's problem is not so much to get more eggs this week than he did last but rather to recognize the fact that hens will lay less eggs from this time on to the end of the laying season next October. Good management must be practiced during the summer months in order that the inevitable slump in egg production shall take place gradually instead of abruptly. The maximum number of eggs can not be laid by hens unless they are supplied with abundance of green food, suitable shade, cool and comfortable sleeping quarters and houses that are free from mites. These are some of the factors that every poultryman must keep well in mind during the summer season.

The four leading pens in each of the principal breeds are as follows:

**Plymouth Rocks**

Harry G. Culver, (Barred), 1427; W. H. B. Kent (Barred), 1346; Purdue University (Barred), 1296; Ontario Agricultural College (Barred) 1276.

**White Wyandottes**

Frank P. Matteson, 1526; Woodbridge Orchards, 1494; Walter Bradbury, 1358; Clemens J. Diemand, 1297.

**Rhode Island Reds**

The Orchards, 1336; John Z. Labelle, 1302; F. H. Sampson, 1265; Applecrest Farm, 1256.

**White Leghorns**

J. Frank Dubois, 1365; Hollywood Farm, 1358; Goshen Poultry Club, 1335; L. E. Ingoldsby, 1292.

---

Taking advantage of the high waters in the San Joaquin River grain growers of the Patterson district are planning to send their grain to market on river barges for the first time in years.

### FRESH FRUIT

These are actual prices obtained July 3 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc., as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apples: New, White Astrachans, loose, 5@7 lb. Packed, 3½@4; tier, 3.25; 4½ tier, 3 per box.

Apricots: Lb., Northern Royal, best, 3@5; poorer, 1@2; local, lug, 75@1.00.

Blackberries: Cr., 2.25@2.50; fy., 3.25@3.50.

Cantaloupes: Haulings light, decreasing. Demand light. Market slightly stronger for good stock. Carloads f. o. b. cash track. Few sales Standards. Mostly Standards 36's. Salmon Tints, 90@1.00. Estimate 110 cars to be shipped July 11. Shipments July 10, 165 cars. Total this season to date, 11,505 cars. Arizona: Shipments July 10, 185 cars. Estimates for July 11, 200 cars. Phoenix, Ariz.: Past 24 hours, minimum 76 degrees, maximum 102 degrees; today at 8 a. m. 76 degrees, clear. Imperial Valley: Standards mostly, 1.35@1.50; poorer, low as 1.

Casabas: 2½@3 per lb.

Cherries: Per lb.: Bings, 17@20; Black Republicans, 12@16; Royal Annes, 10@12.

Currants: Cr. 2.50.

Figs: Black, 10@13; White, 8@12.

Loganberries: 2.00@2.25 per cr.

Grapes: Coachella Valley. Thompson Seedless, 7@10 per lb.

Peaches: Per lb: Best, 4@5; poorer low as 2. Redbirds, fancy, 2.25@2.50 lug. Homegrowns, 75@1.00 per lug.

Plums: Per lb.: Santa Rosas, 3@4. Climax, 2@3 lb.

Raspberries: No. 1, 3.00.

Strawberries: No. 1, 2.75@3.25.

Watermelons: Imperials, Chilean, Klondike and Angeleno 1@1½ per lb.

### CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock July 11, by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 3.50@4.00; market pack, 3.00@3.50; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Special brands, fancy, 6.75@7.50; choice, 5.50@5.75.

Oranges: Demand moderate, market steady. Valencias, special brands, 9.00@10.50.

### HONEY

The orange crop is estimated at ¼ to ⅔ of normal, according to locality. The sage crop is reported generally good, and above average in quality. Perhaps one-half of the crop in the southern part of the state was made by the first of June.

Demand for carlots is reported light, the movement is slow, and the market unsettled. Dealers are said to be buying from beekeepers only on orders. A few carlot sales are reported on usual terms basis as follows: White Orange Blossom, 8½@9, some fancy high as 10. Light Amber Alfalfa, 5½@6 per lb. Beekeepers said to be disposed to hold for higher prices. Beeswax, cash to beekeepers, selling at 22c per lb.

### BEANS

F. o. b. Cal.:

| | |
|---|---|
| Lima, Standard | 9.00@9.15 |
| Lima, Henderson Bush | 9.00@9.15 |

Cal. Lima Bean Growers Assoc. reports some sales made in June for Oct. delivery of 1922 Limas and Baby Limas at around $6.25@6.40 f. o. b. Coast. Demand for futures now quiet. Assoc. has been sold out of 1921 crop for several months.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 20.00@26.00 |
| Barley | 18.00@22.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@22.00 |
| No. 1 Alfalfa | 16.00@18.00 |
| Standard Alfalfa | 12.00@14.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 20.00 |
| No. 1 Dairy | 15.00 |
| No. 1 Alfalfa | 12.00 |

### GRAIN

Prices L. A. Grain Exchange, July 11.

Barley: 100 ton lots July Del., 123¾.

Milo: 100 ton lots July Del. 1.95.

Grain Department California Farm Bureau Exchange: Little wheat has yet come into Los Angeles markets. In fact, less wheat has been coming in for three weeks than is needed for consumption. Reserves, which are very light, are being exhausted. Present prices probably are as high as we will see for a few months as Eastern and Northern wheat will soon be coming in competition as Eastern growers figure they can sell on the Los Angeles market at a profit at present prices. Barley is not yet in export demand. There is a big crop and harvest is just commencing. In the Imperial Valley the exchange has 70 per cent of the acreage and is able to hold back shipments and keep up prices. Imperial is selling well in San Diego and Arizona markets, not so well in Los Angeles.

Prices to grower delivered in L. A.:

| | |
|---|---|
| Wheat No. 1 | 1.90 |
| Barley No. 1 | 1.25 |

# San Francisco Markets

San Francisco, July 11, 1922.

Peaches, 1922, California Peach and Fig Growers' Assoc. prices :

Opening quotations for the 1922 dried peach fruit pack announced by the California Peach and Fig Growers, Inc., show an irregular advance over the opening prices of last year in keeping with the general upward movement of California fruit values. The growers anticipate an increase in the export demand and expect that the domestic trade will hoard their early holdings. Following is the list of prices issued by the Peach Growers' Association quoted, f. o. b. Fresno for August and September delivery:

Yellow—Standards, 9¾c per pound, choice, 10½c; extra choice, 12c; fancy, 14½c; extra fancy, 16c. Muirs—Standard, 10c; choice, 10¾c; fancy, 15½c; extra fancy, 17c. These are basic prices for unpeeled peaches. Peeled are quoted one cent per pound higher and packing charges are one cent per pound in 50, one and a quarter cents in 25 and two cents in ten-pound boxes. Blue Ribbon cartons are quoted as follows: $7 per box of sixty eleven ounce packages , $8.25 for twenty-four two pound packages and $6.50 for ten five pound packages.

Pears, 1922, Packers' prices f. o. b. Cal.:

| | —In 25s— |

### HAY AND FEEDSTUFF

A. W. Scott Co. reports under date July 8:

Receipts past week 723 tons as compared with 725 previous week. The San Francisco market continues very quiet with quotations unchanged. The first two days of the week we observed as holidays and the resulting accumulation has clogged live demand and held trading in buyer's favor with prices weak

Export in better volume and coast shipping picked up. Interior trading still light. Baling is going on actively and dealers are inspecting and estimating the crops, but farmers in many sections are holding at prices two or three dollars higher than consumers are willing to consider. Alfalfa is moving steadily but in light volume—prices are unchanged. The quality of the second crop generally is very good excepting that coming from the Sacramento Valley sections where grasshoppers have inflicted considerable damage.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Grain Department California Farm Bureau Exchange:

Export shipments of California grain from San Francisco have pushed up prices. Japan and Central America are now taking California wheat as it comes in a month earlier than Eastern wheat and therefore commands the market at this time. Northwest wheat will come in a month later so that we do not expect prices to go higher. When the exchange controls as much acreage in the Sacramento and San Joaquin Valleys as it now does in the Salinas and Imperial Valleys the market will be in the farmers hands. It now has 360,000 acres in the state and more is coming in every day.

Prices to grower delivered in S. F.:

Wheat No. 1 ..... 1.95@2.00
Barley, No. 1 ..... (about) 1.25

## Cirrus Markets

Los Angeles, July 12, 1922.

Average shipments of Valencias from the state 40 cars daily; less than 5,000 yet to go. Prices exceptionally strong on eastern markets. Returns on this season's crop because of good prices will about equal last year's. Set of fruit this spring was light and heavy June drop has still further reduced it. Many orchards will have good crop, but it is yet too early for estimates.

Generally cool and rainy weather in East has depressed lemon market. Foreigns available for sale in next 30 days, 163,000 boxes.

### Citrus Shipments

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 19,877 cars lemons, 7,552; total, 27,429. To same date last season: Oranges, 30,396; lemons, 8,329; total, 38,725. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 19,877 cars; lemons, 7,552; total, From Northern California to date this season: Oranges, 372; lemons, 8; total, 380. To same date last season: Oranges, 305; lemons, 5; total, 310.

### CALIFORNIA CATTEMEN'S MARKET REPORT

San Francisco, July 10.—The Chicago market showed a considerable decrease in receipts probably due to the holiday, while prices remained steady.

The San Francisco market remains steady with a rather strong undertone. Dressed beef of number one steer quality is bringing 14½ to 14¾ cents, with a few sales as high as 15 cents. As high as 7⅛ cents has been offered f. o. b. ranch for very prime steers. Because of the fact that 75 per cent of the cattle being killed are only half fat, the bulk of recent sales will probably average between $6.50 and $6.85 f. o. b. ranch for choice steers, with $5.00 to $5.25 f. o. b. ranch for cows.

The Los Angeles market also seems to show some improvement in tone, and sales are reported at 6½ cents f. o. b. ranch in Santa Barbara County for steers and 5½ cents f. o. b. ranch for cows. Sales are also reported at 7½ cents for steers and 6½ cents for cows, delivered in Los Angeles. Buyers have paid 6½ cents f. o. b. Phoenix, for twelve cars of grass steers for delivery August 1. This is equal to at least 7½ cents in Los Angeles.

Information from Nevada that buyers are offering 6½ cents f. o. b. ranch for beef to be delivered this fall, but all offers declined. Utah steers selling for 7¾ cents in yards at Ogden.

Indications of fairly good feeder market in California this fall, and cattlemen are urged to hold half fat cattle for sale as feeders and not force them onto the market for immediate slaughter.

Remember that this market report quotes only actual sales made, all of which can be proven to be correct. Also remember that only the higher sales are quoted, since buyers will keep you informed of lower sales. R. M. Hagen, secretary.

### IS THE THIRD HORSEMAN RIDING?

(Continued on Page 51)

Livestock in this locality may offer a way out for small farm production when a definite market is established here next winter. Farmers who have feed will be able to buy on time, and a definite market will exist for sale. In the past, with local butchers operating at gift prices for small lots, large men contracting and small men coming in at any old price, livestock was out of the question for the ordinary small farmer.

Nero fiddled and Rome burnt. Our politicians fiddle and increase our taxes but little has been done to safeguard the first producer. A united will would force justice to production in a few months, but the majority care nothing for the one man who is producing, and will do nothing until a lack of food brings the lesson home. The organized commodity producers do make a living profit. There is the lesson.

### EARLY SALES OF LIMAS

**By R. L. Churchill, Manager California Lima Bean Growers Association**

Both the association and independent dealers and shippers have sold some quantity of 1922 crop Limas and Baby Limas as futures, but, as we understand, mostly for October rather than either September or November shipment. Of course, any that have been booked for September or for that shipment, if available, commanded higher price than October shipment. Believe most of the October shipment orders, particularly for first half, were booked at around $6.25 to $6.40 f.o.b. Coast.

On account of the high prices now prevailing and which have ruled during the last three months because of a combination of scarcity and manipulation, the wholesale distributors seemed to feel that a price between two and three cents per pound lower than the current market would be a good gamble, so those who were speculatively inclined announced that they had determined to purchase some quantities of new crop stock now, and in turn would try to resell futures to their retail customers. This resulted in some activity during a part of June, but did not last long, since which time inquiry for futures has been quiet.

The weather up to this time has been favorable for the growing crops of beans, and Limas and Baby Limas are generally looking and promising well.

There has been considerable damage from wire and cut worms in certain districts, particularly in the section south and west of Santa Ana, between Saticoy and Santa Paula and over a small area above Santa Barbara.

With this exception, the prospect now favors a considerably better quality and per acre yield of regular Limas than last year. Of course, the critical period is between now and the 10th or 15th of August, which is the blooming and setting time, when favorable weather is most needed and when unfavorable weather, particularly a spell of very warm weather, would do great damage through causing the bloom and small pods to drop.

### AVOCADO DIRECTORS MEET

A very interesting meeting of the board of directors of the California Avocado Association was held at the Van Nuys Hotel on Saturday, July 1. In addition to the directors, there were present representatives from the University of California, the United States department of agriculture, the county farm adviser's office and the Los Angeles Chamber of Commerce.

The different problems and difficulties confronting the commercial growers of avocados were discussed, and it was the general feeling that in as much as the culture of avocados and other tropical fruits is attracting the attention of many horticulturists in Southern California and promises to become an important addition to our horticultural enterprises, that an earnest effort be made to get the department of agriculture to establish an experiment station somewhere in the vicinity of Los Angeles for the purpose of carrying on experiments in the growing of avocados and other tropical fruits, and that a compentent man be assigned to take full charge of this work. The representatives of the different organizations agreed to lend their assistance in helping to bring about the establishment of such an experiment station, and it is hoped that some definite action will be taken on the matter at an early date.

The avocado and tropical fruit growers feel that they must have help of this kind from the government in order to solve the many perplexing problems confronting them and place these new industries on safe commercial basis. Without it they must grope in darkness, so to speak, for an indefinite time, and possibly never solve all of the problems or get the industry firmly established, whereas, with competent government men in charge of such experimental work, whose sole business it would be to make experiments and study the different problems, they could be worked out in a much shorter time and in a very much more definite way, and thus save the future planters the painful and costly experiences suffered by the pioneers of the industry.

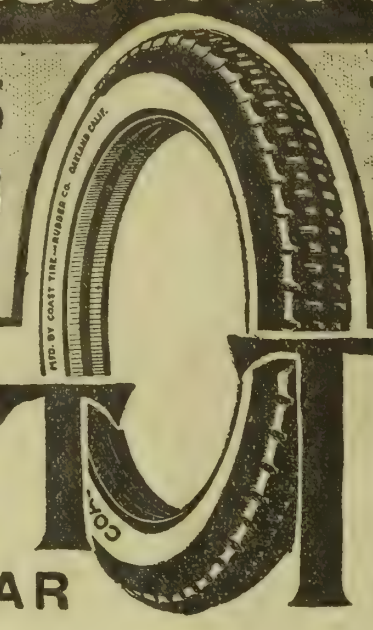
# THE GREATEST TIRE TEST IN HISTORY

## 100,000 MILES OVER UNUSED TRAILS AND UNCHARTED ROADS



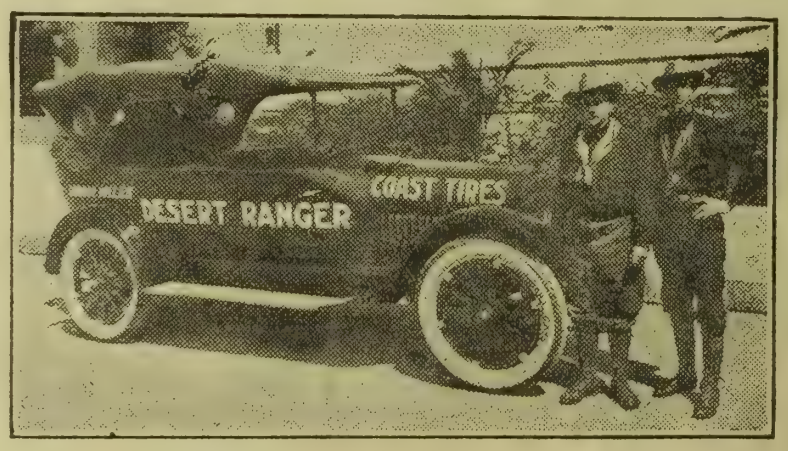
## THE MOST SCIENTIFIC ROAD TEST EVER GIVEN ANY MAKE OF TIRES

# COAST TIRES

WEAR DEFIERS

**Never before has such a test been attempted. Tire performances have been based upon track and road races, or inter-city runs over highways. Coast Tires have triumphed under such conditions, and we are now going to "treat 'em rough" and demonstrate their ruggedness and durability in this, the most severe test ever given any make of tires.**

Colonel King Stanley, one of the most famous of the old-time Indian scouts and an experienced trail blazer, with William Spohn, of Oakland, a noted hunter and sportsman, have started on the first leg of their one hundred thousand mile journey over unbroken roads off the main highways of travel, in order to make a thorough and comprehensive test of the wearing qualities of Coast Tires, and to chart and break roads and trails hitherto unused by automobilists.



## Regular Stock Coast Cord Tires

**will be used throughout this entire journey, and at the end of each day's run accurate speedometer readings will be made and the condition of each tire carefully noted and reported upon to the factory.**

---

## THE LATEST RECORD FOR

# COAST TIRES

## The Mt. Wilson Trail in 22 Minutes

**On Friday, May 19th, Mr. Frank E. Benedict, driving a Paige 6-66 Special, equipped with Coast Cords, lowered all existing records for the famous mountain trail by 5 minutes, 51 seconds.**

**Mr. Benedict claims a great part of his success was due to the perfect service rendered by his Coast Cords over the rough and dangerous trail.**

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

On this week's cover are shown scenes from the great raisin growing sections of California. We think it can be truthfully said that the raisin industry's phenomenal growth is largely, if not entirely, due to cooperation. From an annual production of less than 75,000 tons of raisins which, before the organization of the raisin growers, it was impossible to market in one season. the production has steadily increased, and the present year's crop is estimated at 225,000 tons. Proper handling and uniform packing, together with a national advertising campaign, made possible by the volume of business handled, has created a demand for this vast production at prices that make raisin growing an attractive and profitable industry again. There is no question but that advertising is the greatest present day medium for increasing the demand for farm, as well as all other products, and only through cooperation is it possible for the farmer to advertise his product in a way that will attract the great mass of consumers. Realizing this the Sun-Maid Raisin Growers are planning to expend $2,520,000 in advertising their 1922-23 crop. This is the largest amount of advertising ever done by the raisin growers and is also the largest sum ever expended in any food products campaign in the world.

* * *

And backing this up is another great campaign of advertising and selling cooperation to the growers. This goes steadily on among new members and old through the growers service department. Through its field men it is in constant touch with the grower; at a day's notice can be in his vineyard consulting on some problem of pruning or irrigating or curing. Fertilizer tests are now being made on 200 separate plots representing all soil types found in grape growing districts. A simplified form of bookkeeping has been adapted to vineyardists' use—the first step in that direction taken by a cooperative association. Knowing that a field man will be at Jones' vineyard at 10 o'clock to show him how to test the sugar in his grapes, Brown may drop over, or maybe Smith and Russell come in their cars, and then the whole bunch go over to Green's place to see how his grapes weigh up. Those field men are a busy lot, sometimes their cars show 1500 to 2000 miles a month. They keep in touch with farm center meetings too, and are ready to answer cultural questions there or to explain the work at the big packing plants, what it costs to market raisins in New York, where the advertising funds go—in general help to maintain the cooperative spirit by keeping the 14,000-odd grower members informed of what their brother members are doing to put out a better raisin, what the men in the packing plants are doing to get the raisins to the consumers in attractive shape, what the salesmen in Chicago and Dallas and Copenhagen and Shanghai are doing to sell raisins.

* * *

Sounds like a big and busy business, doesn't it? And it keeps right on growing bigger and busier. We started asking questions about this field service work of the Sun-Maid Growers the other day when Fred Howard dropped into the office, for we happened to remember that it was his idea and that he had put a lot of work and enthusiasm into it. From what he told us we should say that the enthusiasm was striking deeper every day, while the work was broadening out. To the direction of the field service he has added supervision of the growers' organ. To this, the "raisin" education of a sales force scattered from China to Canada—another chance for cooperation. Many of these salesmen had never even seen California, so to them Mr. Howard wrote the "Dear Al" letters in a jolly, personal way, telling how the sugar gets in the raisins, how the grower irrigates day and night when he gets the "run," how the sun cures the luscious clusters they are to sell, etc. These letters, by the way, have been given the name of "the salesman's bible" and 38,000 copies have been issued in pamphlet form to wholesale grocers. They are good reading for anybody—a world of information conveyed in a few friendly words. Our copy has a place on our ready reference shelf and we are thinking of suggesting it as an inspirational textbook in our schools. We believe somebody told us it had been translated into Chinese. Then, of course, there are films showing growing and packing of raisins. Twenty copies are now being distributed, some under Japanese and Spanish titles. It looks as if Sun-Maids were following the sun into every corner of the world.

* * *

We note in the daily news columns that this broadening work has gained for Mr. Howard a new title, that of Director of Educational Activities, which certainly sounds inclusive enough to cover the field for awhile. But there is no doubt as to the greatness of the field in this and other cooperative organizations. We are only getting started here in California. More acres are coming under cultivation, more intensive care is being given them, better fruits are being produced, more and more is the necessity of cooperation realized. Here is the great field of such educational work as we have hinted at above.

* * *

Plant Quarantine Conference decides that no material changes are necessary with regard to the enforcement of Quarantine No. 37. We are pleased to note that at the recent plant quarantine conference at Washington, D. C., it was decided unnecessary to make any changes either in Quarantine 37 or in the regulations of the Federal Horticultural Board for its enforcement. We print the full report made to Secretary Wallace, covering the findings of the committee.

## SMUDGE POTS

None of us living in the citrus belt enjoy breathing the fumes and soot from the lighted smudge pots, least of all the men employed in attending to them while they are in operation, but until it is clearly demonstrated that some better method of frost prevention has become available, we think that the good of the citrus industry demands that we tolerate them. After all we only have to endure them at most a week or two each year, and with the other 50 weeks of ideal California weather we are vastly better off that many of our Eastern and Northern friends who have to remain housed up for a goodly portion of the winter. We venture to say that a lot of these people would like to trade places with those of us who object to inconveniences we have to endure while the citrus grower is trying to save his crop from the freezing weather such as we experienced last winter. We do not doubt but that some better method will be worked out, but until it is we trust that the good people of Covina will not do away with the smudge pots as might be indicated by the following resolutions unanimously adopted by the Frost Prevention Committee of the Covina Chamber of Commerce at a special meeting held on Saturday, July 8.

"Resolved, by the Covina Chamber of Commerce special committee on frost prevention, that we reiterate our opposition to smudge pots and to the theory that they are the only resource for orchard protection during freezing weather; and

"Resolved further, that we are satisfied, from the evidence presented, that frost protection was obtained successfully last winter, at a temperature of approximately 21 degrees, in the Warren Towt 12 acre orchard at Lindsay, without smudge pots and without heat of any kind, but wholly through the operation of the experimental Cobb tower device; and

"Resolved finally, that we are encouraged by this fact to believe that with some practical solution of the problem of cost of installation, financially adjusted to the requirements of orchardists of small means, the Cobb device, or one similar in character with or without a central heating auxiliary, is preferable in nearly every respect to the smudge pot."

## AFIELD

The principal feature of a trip from Chicago to Buffalo in late June and early July is the odor of new mown hay. Through Illinois, Indiana and a part of Ohio the cutting was principally of clover, but after a fore night in Ohio timothy added to the fragrance. Self binders are busy in wheat fields (the first week of July) and in another month oats of which there is a big crop will be in the binding. Speaking of grain I note that Babson comments on the recent report of the U. S. D. A. crop reporting service:

"The outstanding feature of the June government report is that acreage of all wheat, oats, and rye is 2 per cent less than a year ago, but the estimated yield is 17.1 per cent greater. This means that growing conditions are comparatively favorable. I have yet to witness a year where crop scares and marked price fluctuations did not materialize. Weather and insect ravages cannot be forecast, but as conditions now stand the total grain output showed about equal normal proportions. The winter wheat crop is now being harvested, the yield estimated at 3.4 per cent over 1921.

"Spring wheat figures are placed at 18.8 per cent more than a year ago with the total considerably in excess of the ten-year average. Nevertheless, wheat is statistically strong. The exportable surplus for the current year was placed at 255,000,000 bushels. Actual exports for the season approached 265,000,000 bushels. The relatively large crop is entirely offset by the limited carry over. Australian and Argentine stocks are also limited. True, the price level of wheat is high compared with corn and oats. Wheat, however, is the natural leader and would make one point clear; namely that until Russia is again in a position to feed a great portion of Europe, the price of wheat in this country will remain high."

Babson does not think barley worth quoting, or at least the papers which quote him do not include any comment on barley, but on cotton he says:

"I am particularly interested in cotton. The condition is now estimated around 70, which compares with a ten year average of 75. Last year's crop was the smallest in modern history yet the record carry over constituted a total figure that successfully coped with the curtailed European and domestic demand. This year the carry over is nearly back to normal proportions and a crop in excess of 11,500,000 bales is now indicated. This means that the total supply is about equal last year's figure but the potential demand is greater.

"Europe has been taking between 5,000,000 and 6,000,000 bales annually since 1913," concluded Mr. Babson. "The pre war figure was between 7,000,000 and 9,000,000 bales. Europe must buy raw cotton in greater quantity if she is to maintain supremacy in the finished product. With the settlement of the present textile strife domestic consumption will be higher not lower. Theoretically there is a world shortage of cotton and until the statistical position is corrected this condition that cannot materialize for at least another year, the average price will remain as high, if not higher, than the present level."

All of which reminds me that I visited the grain pit in Chicago.

As to that, next week.

---

Acreage planted to cotton this year in the United States is estimated by the U. S. department of agriculture at 34,852,000. This is an increase of nearly 3,000,000 over last year's planting. The big carry over from last year has been cut in half.

# California Cultivator

Vol. LIX No. 4 | Los Angeles, July 22, 1922 | One Dollar Yearly

# Southern California Citrus Institute

By Ernest Braunton

THE opening session of the institute was attended by 350 "citrusites" from all parts of the south end of the state, delegates being resent from Santa Barbara and San iego Counties, and from all interme- iate territory. The opinion was ex- ressed by many that it was the most epresentative gathering of citrus men et held. The "big bugs" were nearly ll there.

J. B. Vaile of Claremont presided nd introduced Farm Advisor Hodg- on, who delivered the opening ad- ress by explaining the agricultural xtension movement and its relation the citrus grower, the keynote of is talk being: "The function of the xtension movement in essence, is to ring the college of agriculture to the dividual rather than forcing the in- vidual to go to the institution in the uest of knowledge. In an important nse the agricultural extension ser- ce is the sales agency for the state llege of agriculture. In addition it so represents the United States de- rtment of agriculture in a similar pacity. It is therefore the function the agricultural extension service to ake available to the farmers of the unty what information has been de- loped by the two above mentioned encies and which is directly applic- le to the solution of the agricultural oblems of the county."

The second speaker was W. S. Rose- ans, president of the Los Angeles unty farm bureau, who made an rnest plea for greater membership all departments. In regard to the rus department he said: "In this unty the citrus grower has always ceived more consideration than any ier type of farmer from the farm reau and agricultural extension ser- e. There has been from the very beginning of the movement in this county a tremendous amount of work done for and with the citrus grower. The citrus grower has also had an advantage over all other farmers in this county in that there are many centers in the farm bureau that are made up largely and in some instances almost entirely of citrus growers."

The conditions which occasion injurious freezes in Southern California citrus districts was the subject treated by Floyd D. Young of the United States department of agriculture weather bureau. Mr. Young has been stationed here for several years, engaged in observation along the lines of his address. He said the weather in California was determined largely by that prevailing over the whole country, but that citriculture is carried on in the valleys, and the mountains largely cut off the general weather conditions prevailing elsewhere. Therefore the general weather forecasts are not wholly applicable. The extreme local conditions are also peculiar. One night in 1918 the temperature at one citrus station was 21 degrees Fahrenheit, while 225 feet higher, and less than a half mile distant, the temperature was 49 degrees. At the lower point the trees were seriously damaged; at the upper point and above there was no damage. The work in the Pomona Valley was commenced by the government in 1917. Weather forecasts are made up from readings of barometers in different parts and telegraphed twice daily. The forenoon's program ended with a paper of unusual value to the citrus grower, by Howard F. Pressy, superintendent of the Rancho Sespe, which appears elsewhere in this issue.

### Friday Afternoon Session

At 1:30 p.m., W. S. Rosecrans was in the chair and introduced J. E. Adamson, manager of the Pomona Valley Protection Association, whose paper on "Ten Years of Frost Protection" appears on another page of this issue. T. R. Woodbridge spoke on frost protection for the small orchard and told how it paid, even if one has to "go it alone," but scored heavily the small orchardist who would not cooperate, in the hope that neighbor's fires and smudges would protect him from serious loss. R. L. Willits, manager of the Call estate at Corona and chairman of the orchard heater committee, rendered his report and had one of the recommended heaters on the platform. This is a nine gallon pot with a louvre stack, with additional sleeve which slips down inside when not in use, making a stovepipe of 40 inches height. Warren R. Schoonover, citrus specialist from the university, closed the day's program with an explanation of the new ideas quite recently launched regarding orchard heating. He said: "No matter what may come after, the orchard oil burner is a success, and all should use it for the present. If something better presents we will then change, but the prospects are for a continuance of the pots now in use for perhaps years to come." In the closing remarks he said that certain citrus districts in this state will lose ten millions of dollars this year because of the fact that there is strenuous objection to the smoke of the smudge pots; an objection which arose from the housewife's horror of housecleaning after a particularly smudgy spell. "You can do a lot of house cleaning for ten million dollars."

The resolutions committee reported, among others of lesser moment, the following of vital importance to all present:

"Whereas, at periodic intervals the citrus districts of California are visited by disastrous freezes, the most recent of which occurred in January, 1922, and

"Whereas, the injury resulting from these freezes has amounted to millions of dollars, affecting the general prosperity of large areas of Southern California, and

"Whereas, our present information concerning the many problems connected with the occurrence of freezes and methods of satisfactorily protecting orchards against injury is far from satisfactory.

"Now therefore be it resolved, that the citrus growers of Southern California assembled on the occasion of the Southern California Citrus Institute at Pomona, July 14, 1922, do respectfully urge the United States department of agriculture, the weather bureau and allied bureaus to continue the valuable investigational work which has been under way during recent years, and to considerably enlarge and augment the same, and

"Be it further resolved, that it would be greatly appreciated if it might be possible for the University of California to participate in work along this line supplementing that carried on by the federal department of agriculture, and

Be it further resolved, that it is our feeling and desire that it is necessary to carry on such work that financial cooperation of the great marketing organizations, such as the California Fruit Growers' Exchange, the Mutual Orange Distributors and others be solicited."

In the evening the citrus growers' annual banquet was held in the Y. M. C. A. dining room, 150 being present. C. C. Teague, president of the California Fruit Growers' Exchange, was toastmaster, and the speakers numerous, not all respondents having their names on the printed program.

# Citrus Pest Control School

Editorial Correspondence

THE fifth annual pest control school of Southern California under the joint auspices of five county farm bureaus, was held at Po- na, July 15. The school dealt with rus pests only, the forenoon session fumigation and spraying and the ernoon devoted to biological control 'bug eat bug."

. W. Hodgson, farm advisor, held chair and the "first at bat" was J. Ryan, horticultural commission- both from Los Angeles County. Ryan presented a number of charts how the records of past year's ac- plishments in control of the black le. Though 1922 figures were also en, the record keeping was much in- fered with through defoliation by January freeze. In Whittier and southwest parts of the county, ugh, the results with liquid gas e uniformly good. In some of the hards uninjured by the freeze, the provement in condition over the vious year, by the three more com- n methods was shown by chart to be per cent for liquid gas, 14 per cent for cyanofumers and ten per cent for pots. In the upkeep of condition of orchards previously in poor condition the liquid gas registered 78 per cent, cyanofumer 68 per cent, and the pot 66 per cent. Mr. Ryan said that owing to the freeze he feared many would not fumigate or spray this year, but that it was really more important this year by reason of weather conditions favorable to scale and the great amount of soft succulent growth made because of the freeze, ideal food and shelter for the scale insects. He said fumigation would start in San Fernando Valley next (now this) week, the first work of the season in the county. During the past year orchards neither fumigated or sprayed showed a deterioration of 45 per cent.

The next paper, by J. L. Prizer, superintendent Bastanchury Ranch, Fullerton, was on the relative merits of fumigation and spraying for scale control. Mr. Prizer recommends fumigation for scale and reservation of sprays for red spider and other like pests and the tree diseases.

### Liquid Gas, Cyanofumer or Pot?

Next came a triangular discussion of the effectiveness of liquid gas, cyanofumer and pot methods of fumigation. The first speaker, J. R. LaFollette, manager of the Covina Valley Fumigation Corporation, said that a careful examination of 1750 acres under his control showed little difference between pot and cyanofumer, but liquid gas was fully as effective as either and the cheapest of the three methods. Liquid gas is easier, therefore suits labor better and is not so hard on clothes. It is also simpler to handle and he considers it decidedly superior to either of the other methods.

M. B. Rounds, entomologist for the Azusa Foothill Citrus Company, said that eight trees were set aside for trial. Upon four liquid gas was used and on the other four the pot method. One thousand insects from each tree were examined, or a total of 8000. Those subjected to liquid gas showed 1.3 per cent alive; those treated by pot showed 2.1 per cent living. In a liquid gas-cyanofumer trial under ideal conditions, liquid gas killed 93 per cent, cyanofumer 83 per cent. He is certain that in many sections scale insects are becoming more resistant to gas. F. G. Wyman, manager of the Growers' Fumigation and Supply Company, disagreed with the two former speakers by saying cyanofumers are superior to pots and both are superior to liquid gas.

R. S. Woglum, entomologist of the field department, California Fruit Growers' Exchange, gave a talk on "Fumigation Recommendations," which we expect to publish in our next issue.

### Bug Eat Bug

Before the bug eating observations were related a resolutions committee recommended that the United States department of agriculture be asked to resume its work carried on for many years at Alhambra. This station was abandoned and special entomological work on citrus pests is no longer on the federal program in California.

The bug watchers who told of battles for possession of the trees were three in number, the first, J. D. Culbertson, of the Limoneira Company, Santa Paula, will tell our readers his story next week.

C. V. Newman, manager of the San

(Continued on Page 83)

# Agricultural News Notes of the Pacific Coast

## Northern California

Marysville has adopted the city manager plan of government.

Forty per cent of California's 1921 rice crop was exported to Japan.

Tree spraying outfits have been pressed into service as fire extinguishers.

Placer County planted 40,000 acres to peach trees this season, 55,000 to grapes.

A half million bags of rice has been sold by the California Rice Growers since June 15.

Vineyardists of Yolo County say they have refused offers of $125 a ton for their grapes.

The fourth annual Eden Township Show opens at Hayward August 9 continuing four days.

Work has begun on the packing plant of the California Prune and Apricot Growers at Colusa.

A disastrous fire northwest of Willows, Glenn County, destroyed 6,000 acres of pasture and standing grain.

Fourteen berry growers were fined in the Oakland courts last week for violating the weights and measures act.

The California Rice Growers Association estimates the 1922 crop at 105,000 tons. Last year's crop was 100,000.

These are busy days in the harvest fields of Livermore Valley. The crops are good and the machines will have a long run.

Practically all canning peaches of Sutter County are reported sold by the Peach Growers Exchange at around $60 a ton.

Bids will be open July 31 by the state highway commission for paving and grading of the roads between Colusa and Long Bridge.

San Francisco is planning its second annual California Industries Exposition, October 27-28. It will be held in the exposition auditorium.

Nevada County fruit growers are getting together this year in the use of a "Grown in Nevada County" label on all fruits shipped to Eastern markets.

California produced in 1921 $15,704,822 worth of gold. Yuba was the banner county with production of $4,738,248. Nevada County produced $2,570,162 worth of gold. Amador came next with $2,267,443.

Gravenstein apple growers of Sonoma County are propping their trees to care for a record crop. Heretofore the picking and packing has been handled by local people but this year several hundred laborers will have to be brought in.

Seven counties of the Sacramento Valley are getting together in a "Hands across the Sacramento River" campaign to start program of development. Butte, Colusa, Sutter, Glenn, Tehama, Yolo and Yuba Counties are joining in the movement.

The Mills Orchards in Colusa County are adopting the tying down system on lemon trees. This spreads the limbs of the trees horizontally, admitting maximum of warmth and light and bringing trees into bearing early. The system, originated by W. A. Caldwell of Camino, has been successfully demonstrated on pears.

## Central California

The Turlock melon carnival will be held September 1-3.

The Hume cannery at Turlock started off with crew of 450.

The Turlock Melon Growers Association has installed a strict inspection.

Tipton, Pixley and Delano sections will ship out 1,000 carloads of cantaloupes.

The cannery at Hilmar is experimenting this year in bottling blackberry juice.

Members of the Sun Maid Raisin Growers have planted 50,000 acres to new vineyards this year.

Friends of California's water and power act are oganizing in the Fresno and San Joaquin Valleys.

Sun-Maid growers will use the packing house of the Turlock Melon Growers Association as a receiving station for raisins.

An inspection is being made of farms in Stanislaus County preparatory to declaring certain sections "weed free areas."

Poultry culling demonstrations are being held throughout Merced County by R. B. Easson of the university extension service.

The first carload shipment of melons from the Turlock district went out July 12. Four cars were shipped, two going to Canada.

The Turlock fig cannery opened July 10. New machinery has been installed and the management expects to make a long run.

Plans for the Oakdale, Stanislaus County, district fair are well under way. The management has on hand $1800 from the last fair.

Modesto has shipped out 39 carloads of apricots the past two weeks. First shipment of peaches will probably go out the first of August.

The Sun Maid Raisin Growers has adopted an advertising budget for next year that will call for an expenditure of two and a half million dollars.

The Cooperative Canning Company at Modesto made a sale of last season's apricots of 57 carlots to an English firm. It declared they were the best canned fruits it had ever handled.

The Cooperative Canning Company at Modesto has a force of 350 women and 100 men busy on apricots. The cannery is paying $92.50 per ton for Tiltons and $87.50 for Blenheims and Royals.

Victiculurist Nougaret of the state department of agriculture has been investigating reported occurrence of phylloxera in vineyards near Oakdale, Stanislaus County. He reports no phylloxera found.

The California Grape Growers Exchange estimates this season's shipments of grapes from Stanislaus County to be 1500 cars. This does not include grapes carried out by truck or shipped to canneries.

Mrs. M. Zumwalt who is in charge of the women's department of the Tulare County fair is asking the women of the county, now that they are beginning the canning season, to keep the fair in mind and prepare their finest specimens for display at the fair.

## Southern California

Walnut growers field day at Santa Barbara, September 2.

R. S. Vaile has returned from a year's special study at Harvard.

Yucaipa Valley has had the most successful cherry season in its history.

Two carloads of grapes were sent from Holtville and one from El Centro on July 12.

The Highland chamber of commerce has been in charge of a cleanup campaign on puncture weed.

The U. S. bureau of markets estimates cantaloupe plantings in the state this year at 31,200 acres.

Canneries at Ontario employ more than 2,500 people and expect to double the number within a few days.

The Orange County Fertilizer Laboratory is now in operation at West Anaheim. D. D. Waynick is in charge.

Horticultural Commissioner F. W. Waite of Imperial County has been authorized to establish a branch office in Brawley.

The San Diego Milk Producers Association met at the Ballantyne dairy farm at Santee, June 28 with an attendance of 100.

The Imperial Valley Associated Chambers of Commerce has petitioned supervisors for an appropriation to aid the county fair.

W. R. Chrisman of Ventura has been selected to head the newly organized Ventura County Vegetable Growers Association.

The Claremont Pomological Club is asking for state appropriations for scientific investigation of methods of frost prevention in citrus groves.

San Luis Obispo County reports high temperatures in eastern part of the county maturing grain, and fog along the coast helping bean crop.

Ontario, San Bernardino County, has such a big fruit crop that the problem of housing orchard and cannery workers is becoming rather serious.

Ventura County fair, October 5-8, will stage a big horse show as Santa Barbara County—which usually makes this a feature—has decided not to hold a fair.

The annual meeting of the California Lima Bean Growers Association was held at Oxnard, July 11. A noon barbecue was held on the sugar factory grounds.

J. M. Paige of Pomona has been elected president of the Associated Chambers of Commerce of the San Gabriel Valley. Twenty cities are represented in the association.

W. B. Hooper of Carpinteria has been appointed extension specialist to conduct walnut field studies. His present headquarters are at the citrus experiment station at Riverside.

A special meeting for poultry raisers of Southern California will be held at Ganesha Park, Pomona, Friday, August 4. The directors of the farm bureau egg laying contest will present plans for experimental feeding work.

Farm bureau meetings will be held in Los Angeles County at Burbank, July 24; Little Rock, 25; Del Sur, 26; Owensmouth, 27; Pomona and Tierra Bonita, 28; Alhambra, August 1; Zelzah, 2; Lankershim, 3; Whittier and San Fernando, 4.

## The Coast and General

Cotton crop is good in both New Mexico and Arizona.

Prune growers of southwestern Idaho are contracting at $60 per ton.

The Southern Pacific will establish motor car service from Tucson to Nogales.

Cherry growers of Idaho have contracted Bings and Lamberts at ten cents a pound, Royal Anns at six and a half.

Heavy showers have fallen in Santa Cruz County, Arizona, Nogales reporting 1.56 inches for the week ending July 12.

Growers of peaches are being warned by Georgia state authorities to dispose quickly of cull peaches to minimize danger of reinfection by brown rot.

James P. Britt, who has been in charge of the division of markets of the state department of agriculture has resigned.

The Hawaiian Sugar Planters Association, in its work of reforesting mountainous areas, will use an airplane to drop tree seed on inaccessible points.

The U. S. department of agriculture is working out color standards for extracted honey so that buyers and sellers can do business without inspecting the honey.

Over 1,000 acres have been signed up by Gadsden, Arizona, farmers for lettuce planting. Somerton, Yuma and Bard are also going into lettuce growing extensively.

Quarantine inspectors will be stationed at Yuma Bridge, Blythe and Daggett to strictly enforce quarantine against cotton and cotton seed boll weevil infested sections.

Once a desert but now fertile and cultivated, the Yaqui River Valley in Mexico this year has over 34,000 acres planted in wheat, corn, barley, alfalfa, cotton, garbanzos, and rice, besides acres of orchards and gardens.

The motor truck is of great value to flower growers supplying the New York City market. By means of the truck they get their flowers on the market with a minimum of handling.

Many beekeepers of the Northwest are said to be experimenting this season with bulk comb honey, such as is sold in Texas, as a result of the lack of demand for comb honey in sections. Some inquiry already for new crop honey.

Arizona's cantaloupe harvest was greatly favored by break in the hot weather the second week in June. Shortage of labor added to the cantaloupe growers difficulties. Arizona cantaloupes are now going out at the rate of 150 carloads a day.

Associate Forester E. A. Sherman of the U. S. service is making a two months inspection tour through the 20,000,000 acre national forests of Alaska. He will make special study of road construction for which congress has appropriated $1,000,000.

Livestock is generally reported in good condition and doing well in the corn belt, the Northwest and the mountain states, with the exception of a few outbreaks of cholera in Illinois and Wisconsin and parts of New Mexico, where cattle have suffered from drouth.

# Uniform Grades for Arizona Cotton

By M. E. Bemis

EDUCATING a boy by beginning with his grandfather is somewhat analogous to raising American Egyptian cotton, to this extent, at least, that there are still some lessons that can be learned from studying the very crude ways of the Egyptian farmers or "fellaheen." We can raise just as good or maybe a little better cotton than is raised in Egypt but the average, which has to be taken into consideration when making the market, is down in the scale and leads us to suspect that we have got to go back and sit at the feet of these slow moving, ox driving, poorly paid ignorant (?) Egyptians and learn that haste sometimes makes waste.

Pima Cotton Gin In Salt River Valley of Arizona.

The British government—in spite of some internal and external opposition in Egypt, that might appear serious if the unpleasantness in Ireland were not so much closer to the footlights, and if the Irish chorus didn't make so much more noise—still controls the waters of the Nile that are held back by the great Assuan dam and released for the use of the farmers in Egypt as needed. The British government still controls the acreage of cotton that may be planted, and in consequence has more influence over methods of grading and marketing cotton than any government or association has in America over cotton, or any other crop.

It is true that the British government has concerned itself but little with the introduction of improved machinery, possibly realizing that to a plodding patient race, there should be allowed the prerogative of taking three times as long to do a job as is necessary, provided that the pay is less than one-third what it is where improved. time saving machinery is used and the standard of living higher.

The purpose of this article is to discuss the methods of handling the cotton after it is grown, but in passing it might not be entirely foreign to the subject to mention the fact that in spite of the slow hand labor of the Egyptian farmers in planting and cultivating there is some advantage that compensates in some measure for the extra time spent.

### No Clods Left

Plowing is with an ox drawn stick, said to be similar to the plows of Bible times. One would have to be optimistic to see where there is any special advantage in that method. Making the ground ready with wooden hoes is little better except that, instead of a certain number of times over a field with harrows and drags, these plodding laborers that earn but a few cents a day beat up the clods until they have made every part of the field as fine as it can possibly be worked. The next step in making the crop is planting, a hand job entirely. This results in a more even stand, first because there are no skips as with a machine and second, because the seed is used liberally so that there are almost sure to be enough plants come up to make an even stand after thinning. If a handful of seed is put at exactly the right distances apart in the row there is pretty sure to be one good plant that will stand right where it is needed. While we have made a great deal of progress in the matter of preparing the ground and planting there are very few fields of a perfect stand. A maximum crop cannot be raised without a perfect stand. It seems obvious that cotton cannot be planted on a large scale by hand, but still I should not be surprised if some one makes the biggest crop yet by hand planting a small field, and possibly a big one. Who

Boll of Arizona Long Staple Cotton

# Conservation of Moisture

By Leonard Coates

A DISCUSSION of the best methods to retain moisture in the soil is as pertinent and interesting as ever. A very large proportion of irrigation water is lost by evaporation before it is able to benefit the trees or vines. This loss could be reduced if after cultivation were more prompt, more thorough and deeper.

### "Drawing the Moisture Up"

My first lesson in moisture conservation. (I did not know it by that name then) was in the summer of 1876 when I was given the job of cultivating a 35 acre field of corn. The foreman of the ranch showed me the cultivator, an old fashioned "double shovel," told me to change the shovels frequently, keeping them snarp, and impressed it on me that I was to bear my weight on the handles so that I reached moist earth all the time. I noticed that this became more strenuous as the season advanced. This, in the farmer's parlance, was "drawing the moisture up." In reality, it was "holding it down." Having been early taught the importance of obedience, I bore upon those shovel handles literally throughout the greater part of that summer,—in fact, I rode upon them. The corn was planted in hills 3½ feet apart each way, so the ground was cultivated and cross cultivated. I dug into moist earth from the time that corn was a few inches high until it was above my horse's head—and he was a big animal, too. Never a drop of rain had fallen upon that field of corn, and I gazed in wonder at the results. The neighbors also; but they gave the credit, of course, to "that fine piece of corn land."

Later I grew nursery stock on the same land and by the same method of deep and continuous cultivation. Never were any better or finer trees raised under irrigation.

Still later I watched the growth of the A. T. Hatch orchards in Solano County where he cultivated among the young trees almost up to the time the fall rains began.

### Lowering Water Table

Mr. Hatch had many adherents, but, as individual orchards grew in extent, so methods for handling more rapidly became popular. The result was a clean, smooth surface, two or three inches of loose earth and a hard plow sole. Weeds became scarcer, trees less vigorous. Breaking up that plow sole, and the planting of cover crops to increase humus were much discussed topics, until now the prime, if not the only desideratum, seems to be the application, or the means to apply, water, rather than the conservation of moisture already in the soil.

I have thus sketched, very briefly and hastily, the "rise and fall" of water in our orchards during almost half a century. Everywhere, except in a few temporarily overirrigated sections, complaint is made of lowering of the water level. Why is this? The rainfall averages the same, and rivers of water are used for irrigation. It cannot be otherwise than in improper methods of conservation of water naturally in the soil, or when applied artificially.

I do not take into consideration exceptional instances, as, for instance, the cropping of new land, whether to peaches or wheat, neither do I believe much in the doctrine of soil impoverishment any more than if it had continued to be cropped by nature with oaks and prairie grass.

The fault lies in the improper handling of the soil, just as the failure of fruit trees long before they are old results from continuous mutilation.

### Cultivation Pays

I might go back farther than in my corn growing experience, for, as a child I remember watching and helping an uncle, who, as an amateur, grew flowers for exhibition purposes; a thorough watering at night was always followed in the morning by as thorough loosening of the soil deeply, with a trowel. The same principle applies in a 6 by 4 foot flower bed, a 35 acre corn field, or a 500 acre orchard.

A long article by a scientist has recently gone the rounds of the papers, explaining why the ground was drier after a heavy rain. Sounds paradoxical, but my own experience during the last three years, when I have made experiments for my own satisfaction, shows conclusively that a soil stirred deeply and very frequently retains moisture much better and promotes a much greater tree growth than the same soil watered frequently but with but poor cultivation.

To say "it does not pay" to do the work thoroughly, is but an excuse, and a very flimsy one: it is all a question of results. Application does not keep pace with theory.

# Ten Years of Cooperative Frost Fighting

By J. E. Adamson, Manager Pomona Valley Orchard Protection Association, Before Citrus Institute

THE Pomona Valley Orchard Protection Association began its career as a cooperative frost fighting organization, May 15, 1912, but like all other movements whose purpose is worth while, its real history began several years earlier. It was born of necessity, its purpose being two fold. Many of its two hundred or more members lived in town at a considerable distance from their groves and required some means of information on the weather conditions without being called upon to maintain a constant watch on each separate property. Also, there was a frank acknowledgement of the fact that with the sooty heaters then in use any considerable increase in the number of heaters would create a condition, at least disagreeable, and that there should be a constant effort put forth to produce greater efficiency and cleanliness in the practice of orchard heating.

In the season of 1908-09 a small group of growers made the beginning, and with an increase each year, both in number of growers and acreage, we entered the season of 1911-12 with about 750 acres equipped with three or four different designs of heaters, but all of the open type. The calling system was of a neighborhood group type. That was soon found to be too cumbersome and had a tendency to work a hardship on the few who were wiling to take the trouble of calling ten to 20 other growers.

The remarkable success of the work that season brought on a great increase of interest in orchard heating, and many who looked with doubt on any plan to "heat up the whole outside" were ready to follow the lead of those who had been bold enough to risk money and time in the effort to show that citrus fruit could be saved by artificial heat.

### Many Plans Offered

So great was the interest that the plan of a cooperative organization was launched, and the Pomona Valley Orchard Protection Association was formed. An effort was made at once to secure better heaters, and one was developed and contracts made for its manufacture, but a compromise heater was brought in by the Fruit Growers' Supply Co., known as the California three gallon, which was accepted by our Pomona people. We found before the year was out that the designers knew little about making a heater that would burn clean, and at the same time keep going, on the oils furnished for fuel.

Many and various were the schemes offered us from that time to the present for the improvement of heaters and heating, some having points of value and others being absolutely without any element of practical value.

We have been criticized by some of the inventors for being too conservative in our reception of new propositions, but our effort has been and will be for the protection of our growers rather than for the assistance of the producers of new theories.

### Rules for Heater Demonstrations

As an example of this we offer for present consideration a set of rules formulated in 1913 for the conduct of heater demonstrations:

1. Each demonstrator will be required to burn two grades of oil. No other oil will be allowed in enclosure. One grade will be 28 gravity, less than 6 per cent pitch. The other to be standard fuel oil purchased from the Pomona Valley Ice Company.

2. Each demonstrator will be allowed to use not to exceed six pots. One-half filled with each kind of oil. Pots to be filled full.

3. Three gallon heaters to be lighted at 3 p. m. Larger than three gallons will be lighted at 4 p. m.

4. Will allow regulation of heaters every two hours, otherwise demonstrators and others must stay out of enclosure. Five minutes will be allowed for regulating of heaters.

5. All heaters will be extinguished at 10 o'clock and weighed to determine residuum.

If these were followed, many claims for good points in heater construction would have been placed in the discard, as in fact was the case in the demonstration for which the rules were originally made. Several heaters showed themselves utterly unfit to be left alone in an orchard with no kind friend handy to shake the soot free from some vital part of the draft or of the combustion features of the heater.

### Studied Conditions

In addition to the activities outlined in the foregoing, we have been always busy assisting in every way possible, with the efforts of the U. S. weather bureau, in the detailed study of conditions in any way responsible for the success or failure of frost fighting. Something over $2,000 has been spent in the past ten years for the advancement of the science and the betterment of conditions of orchard heating.

In 1912 we made efforts to have the weather bureau take a more active interest in the detail of frost prevention, the first definite result being the establishment of a local station with records beginning January 1, 1913, which after a somewhat stormy time for a period of years, under the criticism of many misinformed persons, has been developed into the "key" station for some of the finest forecast work the industry has ever seen.

The season of 1917-18 brought to us a group of trained men of the weather bureau, among whom was Floyd D. Young, who has since been given charge of the work for Southern California.

### Be Everlastingly Prepared

Lessons of importance have come to us in the past ten years, of which it seems there is none more important than this: Be everlastingly prepared. Five times in ten years we have had dangerous to damaging temperatures in November at a time when the trees are the least able to withstand freezing conditions.

The mornings of November 18-19, 1921, found many growers unprepared, and more damage occurred than many realize. This applies to both trees and fruit.

The improved heaters of today cannot be lighted with the speed and certainty possible with the simple forms of 1911-12-13, and more time must be allowed for getting under way.

Also, we have allowed ourselves to change in the spirit of our attack. While in 1912-13 many of the growers were new to the game and ready to go at the slightest alarm, 1921-22 found them just a little too much at ease. The days of winter passed by, and there had come a feeling that there was no more danger, when like thunder from the blue sky came the forecast of a possible minimum of 22 for the morning of January 20, with the further forecast that the low temperatures would be reached at the upper levels first.

### Call Fighters by Telephone

Telephones were busy with the calls before 8 p. m. of the 19th, but the temperature fell faster than the wires could work. Calls before 10 p. m. are always slow, due to the other business on the lines. Then after calls were made, many delayed lighting for fear the heaters would burn empty before morning.

The present system of calling the growers by telephone was started in 1912, and after the experience of that season, was modified at times to correct deficiencies as they developed in practice. The district was divided into zones of influence on the basis of an old but false theory that the elevation above the sea level indicated the degree of frost danger.

This is seen in the arrangement of our call map even today, but we modified our arrangement of names on the sheets used by telephone operators to correct the error to some extent. Further modification will be made the coming year by using a code number, indicating the thermometer station which dominates any grove or group of groves. By this means it will be possible to call a portion of a sheet earlier than the rest.

### Cold Air Flows Into Depressions

As a matter of fact the zones of influence affecting the frost danger lie in line with the old washes and intervening ridges, spreading out fan like from the mouths of the various canyons of the mountains to the north. Also, as we get away from the mountains, by the valleys formed by the various low ranges of hills to the west and south.

The cold air simply flows by gravity down the slopes, diverted here and there by some local topography, but always down, to take the place of the warm air that is ever rising on account of its lower density. On the steeper slopes the rate of flow is more rapid than in the lower and more level valleys and the cold air forms a thinner stratum than in the valleys. This is the reason for some of the freaky conditions found in the hilly country to the west of us. There are places where you can see the slow but sure filling up of the vallley floor with the cold air until, when the spell was past, only the extreme upper parts of the slopes were untouched.

### Many Small Heaters

Recognition of these facts should enter to a large extent into the layout of the heating system. Heaters should be placed at right angles to the slope in close set rows and every heater in the row fired to heat the cold air as it reaches the barrier and force it to divert upwards and sideways from the grove.

These rows should be as close together as is found to give the desired

(Continued on Page 83)

FROM a mountainous section of Colorado, especially hard on tires because "the roads are always full of rocks," comes the following testimony:

"One of our dealers drove in here recently from the country with four Red-Tops on an old Ford car, which he said had been on for over two years and he had given up figuring how far they had gone. 'The only trouble with the Red-Top,' he said, 'is if you ever sell a man you never get a chance to sell him again because the tire never wears out'."

Where the roads or the loads break down ordinary tires quickly, there its extra ply of fabric and the extra heavy tread place the Red-Top in a class by itself.

*There's a Fisk Tire of extra value in every size, for car, truck or speed wagon.*

***New Superior Model***

# The World's Lowest Priced High-Grade All-Year Sedan

# *The Ideal Family Car*

***The Comfort and Weather Protection of a Limousine For Less Than the Cost of Most Open Cars***

**$875**

**F. O. B. FLINT, MICH.**

Never before has a Fisher Body Sedan of this quality been offered at a price so low. The beautiful lines, superb finish, luxurious upholstery and refined appointments that have made Fisher Bodies the standard of excellence in closed cars, are all here in full measure. Its four doors fit perfectly and cannot rattle.

The heavy plate glass windows can be instantly lowered to any desired point, or as quickly raised, and the plate glass windshields are both movable, permitting instant conversion of the Sedan into either a closed or an open car.

Mounted on the New Superior Model Chassis, this car is fully equipped mechanically, and combines ample power and speed with steadiness and ease of handling.

No matter what car you now use, or think of buying, investigate this Sedan. Its power, speed, appearance and appointments please discriminating motorists accustomed to paying higher prices for closed cars.

Its low price and low maintenance appeal to all who find it desirable to economize. In no other car on the market can you find this unusual combination of Style, Quality, Economy, and Year-'Round Service.

FAST THRESHING—AND GOODYEAR BELTS

*When he thinks of the belt troubles* he put up with before he got his Goodyear Klingtite Belt, George F. Gerk, of Hillsboro, North Dakota, says he sometimes wonders how he ever got his threshing done.

*Those ordinary belts*—he tried many kinds of them—slipped and lost power, had to be limbered up every morning. They were short-lived, expensive and bothersome.

*His Goodyear Klingtite Belt* holds the pulleys in the slipless grip of its friction surface, works just the same one day as another, and distributes the load evenly. It requires no dressing, eliminates engine resetting, and needs no breaking in.

*Goodyear Klingtite Belts* are reliable, trouble-free and economical; they are made in endless type for threshing, silo-filling, feed-grinding, wood-cutting and other heavy duty, and in suitable lengths for lighter drives, like churning, cream separating, water pumping, wash machine and electric light plant drives.

*They are sold by* Goodyear Dealers everywhere and by many progressive hardware merchants. For further information about them, write to Goodyear, Akron, Ohio, or Los Angeles, California.

# THE AUTO-OILED AERMOTOR

**A Real Self-Oiling Windmill**

*A year's supply of oil is sent with every Aermotor*

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

### Deeding Separate Property

Can a husband sell real or personal property which he owned prior to marriage, without the signature of his wife? Can he sell community property without her signature?—Subscriber, Glendora.

The separate property of the husband or wife, can be sold or conveyed or willed without the consent or signature of the other. The husband has the management of the community personal property with like absolute power of disposition other than testamentary as he has of his separate estate, provided that he cannot dispose of it without a valuable consideration, nor sell, encumber or convey the furnishings of the home or wearing apparel without written consent of the wife. The husband also has the management and control of the community real property but the wife must join with him in executing any instrument by which it is leased for a longer period than one year or sold, conveyed or encumbered. As a practical proposition the searchers of titles never wish to ascertain or adjudge the sometimes complicated legal proposition as to whether or not the property is separate or community and for their own protection they almost invariably require the signature of the wife on conveyance even of separate real property. If the wife refused absolutely to do so it is probable however, that this might be arranged.

### Delinquent Taxes

Kindly explain the matter of delinquent taxes on real estate.—Subscriber, East Bakersfield.

The matter of county and state taxes is regulated by the political code and is the same throughout the state. Taxes on personal property, even though assessed against real estate, become delinquent on the first Monday in December of each year. Taxes upon real property may be paid in two equal payments, the first on or before the first Monday in December of each year and the second on or before the last Monday in April of each year. If such taxes are not paid and so become delinquent the county tax collector makes up what is known as the delinquent tax list which must be published on or before the 5th day of June of each year, setting forth the description of property and amount of taxes, penalties and costs due. Five years from the date of such publication the state of California becomes entitled to a deed for this property upon which taxes are thus delinquent. In fact, all property upon which taxes are delinquent is marked, "Sold to the state," after the date upon which the last payment should be made. After the period of such delinquent taxes no person has any right to remove or destroy any building or improvement on the land or in anywise impair their value. During this period of five years the property may be redeemed from tax sale by the owner or any party, in interest by paying to the county the full amount of the taxes, costs and interest to date. If the property is not redeemed within that period then the tax collector makes a deed of the property to the state of California and thereafter at a sale of all properties for which deeds to the state have been made, the state conveys title by what is known as the tax deed to the highest bidder, and the title of the original owner to the property is thereupon terminated. There are, indeed, various other provisions with respect to the collection of taxes, but the above stated is the general procedure followed. By no means is the property taken away from the person who has not paid the taxes during the interim of the five years.

### Failure to Meet Contract

I bought land from a party on an installment time contract which provided that in the event of any failure to comply with the terms of the agreement the vendor should be released from all obligation to convey the property and time is the essence of the contract. The interest became due on a certain date but not having the money I tendered the vendor a check five days later, but he says he is going to foreclose. Would his action be upheld if the matter comes to the court?—Subscriber, Terra Bella.

Undoubtedly the vendor has a right to require strict compliance with the terms of a contract containing provisions such as are above stated, and in case the vendee fails to live up to the terms of his agreement his interest may be cancelled. If the contract is recorded an action would be necessary upon the part of the vendor to quiet the title to the property. It has sometimes been provided in judgments of this character that the vendee was given a certain specified time, say thirty or sixty days, in which to pay up the whole amount of principal and delinquent interest, but this is not invariable.

### Using Company Property

I am a stockholder of a mutual water company. Can the general manager use for his own purposes the equipment of the water company? Are the directors responsible if they permit him so to do? Is such action lawful, even though the use of the equipment is subsequently paid for?—Subscriber, Rannels.

The actions complained of on the part of both the manager and directors are illegal, and action can be taken against each of them both for the costs of the use of the equipment of the company and for a breach of the trust which is reposed in them. Just exactly what action could be taken would depend very largely upon the terms of the bylaws and charter of the company. The fact that payment is subsequently made does not change the legal phase of the matter except that the action of the manager may be construed to have been ratified by the board of directors. But whether they had the power so to ratify such a contract would again depend upon the bylaws.

### Diverting River

Flood control board has diverted the waters of a river so that many of our fields are drowned out. What redress have we for such diversion from the natural course? Can the board be compelled to turn the water back into its natural channels?—Subscriber, Artesia.

Generally speaking, waters cannot be diverted from their natural courses and in case of such diversion damages may be recovered against the party, corporation or division of the government which makes such diversion. Injunction would also lie to restrain such diversion or, in fact, any change in the natural course of the river. To apply this rule, however, to any individual case, especially in the matter of California rivers, which so frequently have changed their course so that it is difficult to ascertain what in fact is the natural course of the river, would require a thorough investigation of the particular situation. It must be remembered that these concerns, particularly governmental corporations, do not usually take such action without careful investigation. It is, of course, well established that no man's property can be taken or damaged for public use without compensation being first paid. These questions present very complex situations, upon which the writer would hesitate to give an answer without thorough investigation.

### Making Will

Is a will made by husband and wife and not witnessed, valid? Can an administrator be chosen from any part of the state? What fee could he require?—Subscriber, Redlands.

It is difficult to see how a will could be made by two persons, as a will takes effect at the death of one person, and, therefore, it is a very individual matter. It can be changed at any time prior to death. There are two usually adopted forms of will. One, called an olographic will, must be wholly written, signed and dated in the handwriting of the testator.

This does not need witnesses. The other form, known as the written will, may be typewritten or partly written and partly printed. This requires two witnesses in California. The requirements as to witnesses vary in the different states. A person who takes under the will cannot act as a witness. That is, if they do act as a witness they cannot take under the will. These witnesses must sign in the presence of the testator and in the presence of each other, and to them the testator must have declared the will to be his last will and testament. If a will is executed in any other manner than those stated it is invalid. An executor may be chosen from any part of the state. The code provides that the fees of an executor or administrator are 7 per cent on the first $1,000 and 4 per cent on the next $9,000, with decreasing percentages as the amount grows larger.

Former residents of Illinois will picnic at Long Beach today, July 22.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Kadota Figs on Adobe

Noting question as to success of Kadota figs on adobe soil, a Los Angeles reader informs us that Kadota figs on his place most emphatically are a success. His soil is the blackest and stickiest kind of adobe. The figs fruit abundantly, are large and fine flavored. One tree cut off level with the ground a year ago is now up four feet high and bearing.

### Beans and Cucumbers Ailing

Kentucky Wonder beans and cucumber plants, both healthy, suddenly begin to turn yellow and bean leaves are soft when they fall. Plants are now bare. Cucumber leaves get stiff and hard. I can see no insects on them. What can I do for them?—Subscriber, Reedley.

Though not plainly in evidence we believe minute insects are present as symptoms are those of red spider. Kentucky Wonder beans are favorites with the spider, over other beans. Look on under side of leaves very closely or use a microscope—the reddish brown insects may still be present, surely their eggs. A daily spray with cold water before sun is up would have banished the insects. It is doubtful if any remedial measures will now help, for crop may be ruined and insects gone.

### Blackberries Dying

Kindly tell me what ails my blackberry vines. They are the Mammoth and were planted last season. This year they made good growth and were loaded with fruit. When fruit was in midseason vines began to turn yellow and finally die, root and branch. Now the entire field is infested. What should I do?—Subscriber, Snelling.

Correspondents having such troubles should give all possible information and send sample of affected vines. The cause of death we cannot determine; there are so many, any one of which might produce results described. A heavy crop alone would not kill but, combined with some trouble just as plants are making their greatest effort, would cause death more quickly than at other seasons. So sudden a collapse could result from a rise of alkaline water about the roots, due to local irrigation, perhaps a field on higher ground. It may come from antharcnose—a sample of diseased vine might make easy such determination. Look on roots for crown gall, large wartlike growths. As any

CORRECT CONSTRUCTION
in the next tire you buy

The Savage Cord was built to give remarkable performance on stage lines and other hard runs. It is not built by any so-called secret process, nor is it freakish in its construction, but it does embody the best known practices and latter-day attainments in cord tire construction. It has been built to be the world's foremost cord tire—built to endure long and to serve well.

In it are seventeen features of design and inbuilt strength that appeal particularly to motorists who travel country roads; making a remarkable tire with

Extra heavy construction throughout;

Generously heavy sidewalls, of the same rubber and as tough as the tread to protect against rut wear;

A scientifically efficient non-skid tread, so soft that it does not "cut" or "chip" and yet so tough that it wears extremely well—a rare combination.

The Savage Cord will pound out thousands upon thousands of miles of good, hard service, and in doing so, eliminate to a large extent, tire trouble, needless expense and delay. You'll find it a paying investment.

Other good makes of tires may use one or more of the seventeen constructional features we have incorporated into the Savage Cord but no other tire that we know of begins to embody them all.

WE GUARANTEE

that not an ounce of shoddy or adulterants is used in the building of the

of these could cause death quite suddenly, and possibly a few other troubles, we are quite at sea regarding advice, as a page could be filled with generalities.

### Pink Beans

Are bees a benefit in pollenizing pink beans? How many years should pink beans be planted on the same ground? Do they build up the ground or not? What would be the best to plant after pink beans?—Subscriber, King City.

This question was referred to the California Bean Growers Association and Manager Robert H. Fraser answers:

"Naturally bees would be of benefit in pollenizing any plant that can be fertilized by pollen, but the actual fact is that they are not absolutely necessary, as the pollen sacs of the beans burst when sufficiently ripe and the temperature is about 85 degrees, and the pollen is scattered by means of the wind, etc., so that as far as we have any information a field would be thoroughly pollenized without bees. Regarding the number of years that pink beans can be planted on the same ground, will state that the longer beans are planted, the more profitable and bigger crops can be raised, as they, being a leguminous plant, increase the fertility of the soil. This has been particularly worked out in the Lima bean sections, where 20 years ago they used to get an average of 10 sacks per acre, and after these beans have been planted continuously for 20 years on the same ground, they are now getting 20 sacks per acre. They most certainly do build up the ground, as beans have the ability to take nitrogen from the air and store it in the soil, and that is one of the most costly fertilizing elements that there are. After beans, any grain crops, such as barley, wheat, oats, or corn crops, such as field corn or gyp corn, or maize, could be profitably planted."

---

Although California has established a quarantine against importation of cotton seed, it will still be admitted from Arizona under permit for mill and seed purposes.

# Plant Quarantine Conference

NEED for safeguarding the United States against the entry of foreign plant pests and diseases is emphasized in the report made to Secretary of Agriculture Wallace by the special advisory committee appointed by him to follow the proceedings of the plant quarantine conference held here in May. The belief was expressed that no material changes are necessary either in Quarantine 37 or in the regulations of the Federal Horticultural Board for its enforcement.

The report commends the idea of committees representing the various interests affected by the quarantine regulations. Frequent conferences between the committees and the board, the committee said, would bring about a clearer understanding on the part of all and secure the beneficial results sought by the act.

The committee pointed out the losses now suffered by American agriculture from pests accidentally imported before Quarantine 37 went into effect. In view of the danger of other destructive pests being brought here much greater care than formerly must be exercised to keep them out. The difficulties complained of in the administration of the quarantine are due to the unknown factors that have to be dealt with.

The report is signed by the late Prof. J. C. Whitten, horticulturist of the University of California, Dr. A. F. Woods, president of the University of Maryland, and M. R. Cashman, president of the American Association of Nurserymen. The conference was attended by leading florists and nurserymen from practically all parts of the country, as well as many state officials and other interested persons, including representatives of foreign countries.

The text of the report is as follows:

"In response to your request of May 12, 1922, we attended on May 15 and 16 the plant quarantine conference called by you to consider particularly the classes of plants which should be permitted unlimited entry under Regulation 3 of Quarantine 37 and other questions connected with the administration of this quarantine.

"The conference was well attended by representatives of the various interests involved and each and every one was given a full and impartial hearing. The subject was discussed from every angle both by representatives of groups, such as the nurserymen, florists and ornamental horticulturists, orchid growers, rose growers, etc. and by individuals. Everyone was encouraged to make constructive criticism and suggestions. After every one who desired to be heard had spoken, often several times, including the representatives of foreign countries, each group was asked to form a committee to submit further recommendations and hold further conference. We are impressed all through with the effort made by the secretary of agriculture and the Horticultural Board, to give a full, fair and unprejudiced hearing to every one.

"In our opinion the board is properly constituted as to membership and exercises unusual care to get expert opinion and advice. There is every evidence that the board intends to render every possible assistance to the trade and to individuals in making introductions.

"To those familiar with the losses now being suffered by the United States from pests accidentally imported before Quarantine 37 was effective, and knowing the dangers of further introductions, it must be clear to any unprejudiced mind that much greater care than formerly must be exercised to prevent introduction of organisms that may become pests. We believe that the measures adopted by the board are wisely directed to this end. It is clearly apparent to us that the difficulties complained of in the administration of the act (Quarantine 37) are due to the necessity inherent in the work of dealing frequently with unknown factors. As the difficulties and dangers become clearer adjustments will be made to more perfectly meet the situations.

"It is evident that the board wishes to do everything in its power consistent with safety to assist in securing desired importations.

"We commend the idea of committees representing the various interests involved. Frequent conferences between such committees and the board will bring about a clear understanding on the part of all and secure the beneficial results that the act was intended to give.

"With reference to the act (Quarantine 37) itself and the regulations under it, we believe no material changes are necessary."

# California Fruit Crop Report, July 1

By California Cooperative Crop Reporting Service

### Apples

The apple crop is estimated 85 per cent normal as compared with 59 last year and a 10 year average of 80. Gravensteins in Sonoma County will probably show 50 per cent increase over last year. Late apples shy. In the Watsonville district late crop reported better than early. Present conditions indicate about 7,490,000 boxes.

### Apricots

Now estimated 59 per cent normal as compared with 46 last year and a 10 year average of 69.

### Cherries

Cherry production estimated 70 per cent normal, about 12,000 tons as compared with 13,000 tons in 1921.

### Peaches

Peach crop 98 per cent normal, as compared with 72 last year and a 10 year average of 82. About 420,000 tons estimated, against 320,000 last year.

### Pears

Pears 80 per cent normal, compared with 59 last year and a 10 year average of 77. While the reports of blight continued throughout the month indications point toward a crop of close to 100,000 tons for 1922.

### Plums

Plum crop spotted, some varieties only half crop, others practically normal. Few reports of sunburn. Estimated 79 per cent normal as compared with 68 last year and a 3 year average of 73.

### Prunes

Should present condition be maintained next two months total production of prunes will be about the same as last year, right around 100,000 tons.

### Figs

Crop estimated 91 per cent normal as compared with 84 last year. With new bearing acreage and older trees this year's production should amount to about 12,000 tons.

### Olives

In Los Angeles, Tulare, Sacramento and Butte Counties there has been a very light set of fruit, and the condition for the state as a whole is only 60 per cent normal as compared with 63 last year and a 10 year average of 81.

### Oranges

High temperatures the latter part of June caused a heavy drop in practically all orange growing districts. The drop will doubtless continue during part of July, making it exceedingly difficult to estimate the condition of the crop at the present time. Tabulation of reports shows a condition of only 63 per cent normal, as compared with 75 last month, 88 one year ago and a 10 year average of 81.

### Lemons

Bloom has been very late and irregular owing to lateness of season, and the high temperatures the latter part of June caused a heavy drop which is not yet over. The condition is estimated at only 56 per cent normal as compared with 63 last month,

85 one year ago and a 10 year average of 83.

### Almonds

Crop is 79 per cent normal as compared with 62 last year and a 10 year average of 70. With new bearing acreage and older trees a crop of between 9,000 and 10,000 tons for 1922 is indicated.

### Walnuts

Walnuts reported 85 per cent normal. Last year the condition on July 1 yas 75, and the 10 year average, 85. Crop spotted, good in Orange County but rather poor in Ventura. Production will probably be about the same as in 1920.

### Grapes

Wine grapes reported practically normal, indicating production of at least 380,000 tons.

Raisin grapes slightly sunburned in a few localities latter part of June and crop estimated about 98 per cent normal, as compared with 69 last year. Indications for slightly better than 200,000 tons.

Table grapes 92 per cent normal as compared with 69 last year. Malagas in Fresno County are a light crop, and Thompson Seedless show a rather light setting in some districts. With favorable conditions the total crop should amount to about 175,000 tons.

## TEN YEARS OF COOPERATIVE FROST FIGHTING

(Continued from Page 78)

results. But it is our opinion, based on results, that the fires should be numerous and small, placed not over 20 feet apart in the rows and every heater in the row fired, rather than a few large heaters scattered hit and miss through the grove and burning a gallon or more per hour.

If there is one thing that has been shown more than another this year it is that the oil consumed is by no means the measure of the success in fruit saving.

We have instances of oil cost as low as $12 per acre with a salvage of 85 per cent, and others of oil cost of $50 per acre and a salvage of 90 per cent, both in the same locality.

Another with an oil cost of $30 per acre and a salvage of 95 per cent and one of an oil cost of $60 and a salvage of 20 per cent.

The lower cost in both these instances was with small fires and the higher cost in both cases with large fires. The number of fires per acre was not seriously different in the several cases.

Other ways to prevent frost damage have been tried out when there seemed to be any valuable element in sight.

### Other Protection Tried

Air circulation in some form seems to have the greatest number of adherents on account of the beneficial effects so often seen on windy nights.

Three times this association has made definite experiments, and at other times assisted the weather bureau in tests of private owned plants. The results have at all times been so poor, compared to the cost, that we have been discouraged from feeling much interest in this theory until some one can show us something better than anything we have seen.

In 1912-13 we piped a small orchard with steam, using inch pipe exposed and fitted with an adjustable outlet at each tree. The fuel cost was about double that of oil burned direct, and the plant cost was so great as to be out of the question.

In the season of 1913-14 we covered an acre with tobacco cloth and found the mechanical features so difficult to deal with that the slight benefit in temperature, without heaters, would not compensate for the added expense.

### Summing Up

To sum up the results of our experiments, I believe it is safe to say that our committee is a unit in favor of the heater as the only known way of preventing frost damage. Also, that there is not enough advantage in smoky heaters to offset the dirty fruit and the disagreeable effect on the community. The real advantage lies in having a heater that will burn steadily without much attention for a long period.

With this end in view our committee has had developed a simple stack for oil burning heaters, which can be fitted to most of the old types of heaters. It enables the grower to have his heaters operate with a steady fire, requiring little attention and giving combustion that will work a vast difference in the condition of the air during a prolonged period of freezing weather.

## CITRUS PEST SCHOOL

(Continued from Page 75)

Joaquin Fruit Company, Tustin, confined his remarks to red spider. He says that natural enemies keep the pest fairly well in check in his district, though spraying is at times necessary. He advised all in infested districts to have machines and spray material on hand, ready for operation at short notice, and when pest becomes really injurious to spray without delay.

H. M. Armitage, in charge of the state insectary at Whittier, gave an outline of the work carried on to introduce Aphycus Lounsburyi, the now noted black scale parasite. In inland districts the short, even hatch leaves the aphycus without food and it perishes. In coastal districts the hatch is uneven and so prolonged that food is available throughout the active season of the insect. So the eggs are laid in the scale, and though the parent then dies the more numerous progeny emerges at a time when food is again plenty. The parasite cannot live without the insect host—the black scale. Last year the insectary made 1000 shipments of 19 species, a total of about one million, half of which were aphycus. Rhizobius and scutellista are also necessary for control of the scale for the three prey upon black scale at different periods.

D. Eyman Huff of Orange read a paper on the county insectary plan, but as it was based largely on Ventura County work, the same information will be found in the Culbertson paper next week. Orange County has but recently built an insectary, and then only after careful study of its predecessors and Mr. Huff thinks they have the best. In fact, says they have.

### Red Spider Control

Prof. H. J. Quayle, citrus experiment station, Riverside, told of both insects and sprays for control of red spider. The insects are not new to Southern California, but the scientific names are new to the general public and they don't look good in print—too long and too hard to pronounce. But one of them, called brown lace wing "for short" ate 21 to 44 spiders each day until it had consumed a total of 800. Two other species "nameless here forever more," ate 15 a day for 16 and 18 days, respectively. Still another ate 20 each day for 15 days, a short life but a glorious feast.

Red spider control is decidedly a local problem—an individual ranch problem. Insect enemies may hold them in control, but be ready to spray. There are many sprays, of many materials, and what is reported on as most successful in one district is not the best for another. In one district lime-sulphur registered the best kill, but in the Chula Vista section of San Diego County the oil sprays have given better satisfaction. Prof. Quayle recommends as very good a two per cent lime-sulphur but would add to this five to ten pounds of sulphur in each 200 gallons, using a glue or some other carrier in which to dissolve the sulphur. That's all until the 1923 meet.

## WAGE SCHEDULE FOR HAULING TO CANNERY

Temporary permits to trucks to operate in Southern California fruit districts during the coming season have been issued by the railroad commission. Rate schedules fixed are: 1 mile, $1.10 per ton. 1 to 2 miles, $1.20 per ton. 2 to 3 miles, $1.30 per ton. 3 to 4 miles, $1.40 per ton. 4 to 5 miles, $1.50 per ton. 5 to 6 miles, $1.60 per ton. 6 to 7 miles, $1.70 per ton. 7 to 8 miles, $1.80 per ton. 8 to 9 miles, $1.90 per ton. 9 to 10 miles, $2.00 per ton.

---

Waves 50 feet in height (trough to crest) and 220 feet in length (crest to crest) were encountered in the North Atlantic Ocean on March 4, 1922 with a wind blowing 100 miles per hour.

# What's the Answer to "How do you do?"

THINK it over carefully—and then answer frankly. Face the facts. Do your nerves and digestion stand the jolting of the coffee drug? Can they *go on* standing it.

There's charm and complete satisfaction in Postum—and freedom from any harm to health.

Thousands of sensible people who have seriously looked for the answer to "How do you do?" have turned from coffee to Postum, and are doing so well, in satisfaction and health, that they wouldn't think of turning back.

You can begin today, with an order to your grocer.

Postum comes in two forms: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for fully 20 minutes.

## Postum for Health

### GODFORSAKEN

(Dedicated to one met on our travels)

"A godforsaken county! How a guy
Can stand it here is more'n I can see,"
He grunts; his little eyes maliciously
Blink at the fair green country passing by.

At far, round hills within whose placid arms
The weary sun is resting from the day;
At quiet vales enclosing pleasant farms
In all the fair, glad radiance of May.

He stares and blinks .. .. .. ..Of purple now, and gold
Are earth and sky. Now working time is done
And in sequestered farmsteads, one by one,
The lamps are lit; and lifted eyes behold

The dawn of stars .... .... .... ....He stares, inert, unshaken,
And blinks, and grunts, and mumbles, "Godforsaken!"

R. L. in Extension Service News.

### THE FAIRY CHILD

By Marianne Gauss in Youth's Companion

IT was in the dusk of a fall day that the fairy child came to Faith, to be dressed in Bunny's clothes and laid in the little bed with the brass knobs that Bunny loved so much.

The afternoon before the coming of the changeling, Faith went to ride, alone. As she mounted her pony, she saw the river dimpling merrily in a breath of wind—just as if it had not drowned Bunny. She looked away from the water to Jim's face.

Bunny had been very much like Jim, strong and quick, with the same eager brown eyes; but instead of dark hair like Jim's he had tight yellow rings—like his mother's.

"Where are you going to ride, Fay?" Jim had shortened her name to Fay, because she was slight and small, and because until Bunny had gone she had always been as merry as a fairy. "Don't you want to ride into town and see Minnie?"

He thought that his sister's new baby might comfort her; but Faith wanted to ride where she would be in no danger of seeing a child. Turning her horse quickly, she went down the river trail, under the cottonwood trees, past the quicksands. At the turn into the canon she waved her hand; and when Jim could no longer see her, she paused to look at the treacherous river.

The water had gone down in those few days since Bunny was lost: that hillock where they found his little red shoe had been right at the brink—it was now far inland. No one had seen him the day he slipped away; but Fay knew how he had looked in his blue rompers, with the rings of hair dancing, as he scrambled over the sand to the river. He could not walk; but put him on all fours, Jim used to say, and he would get to the coast very quickly.

"I ought to have known," she said to herself. "I ought to have frightened him about the river."

As she rode, everything reminded her of Bunny. On one of the riverside cottonwoods Jim had cut the letters "J. B. T., Jr.," for James Bunson Tucker, Junior. She entered the canon, and meadow larks were blowing their silver trumpets. Bunny had loved that happy call.

And now—farther in the canon—she was reminded of the dark days after Bunny was lost. Because of the swollen condition of the river it was not possible to recover the drowned child. So they had kept on searching, kept on faintly hoping until hope died. It lived longest with Fay. And in one sense hope was not yet dead—she would see Bunny sometime, somewhere. But her heart was sore; she could not go near other people's babies.

The trail wound higher up the canon. Cedars dropped a rain of bluish berries, on which the birds were feasting. The fresh air and the mountain stillness seemed to comfort her. She thought she would ride on as far as the Indian camp—she could easily go so far and back before dark.

But she rode a long way and did not come to the camp. Finally the trail wound through a grove of evergreens; and when she emerged, the sky, which had been hazy all the afternoon, was overcast. The wind swept raw and chilly from the peaks. And presently she felt moisture against her face. She drew rein and looked about her. Twilight was upon the mountains. Near her, beside the trail, rose a reddish, steeple pointed rock. This, she knew, was beyond the Indian camp—she had come a long way from home.

How had she missed her landmark? She rode rapidly back the way she had come, and finally came to a place near which, she thought, the wikiups had been. Perhaps the Indians could tell her a shorter way home. She dismounted and led her horse across a place that was covered with cat-tails.

The wikiups were gone from their clearing; their occupants had migrated like swallows.

Fay swept the distance with her eyes. This was the place; she recognized an old cabin with its windows gone.

"There is a short way home from here!" she thought. It was rapidly growing dark in the canon. All was still; even the sound of raindrops pattering on the leaves had ceased, for the rain had turned into snow.

Just below the place where the Indians had camped, Fay found a trail that seemed to be the short way home. She had gone some distance on this wild and lonely road before misgivings troubled her. A moment later she found her way blocked by a tract overgrown with cat-tails. So she dismounted to reconnoiter

As she walked, leading her horse, a small brown bear started up from among the trees. He was a good humored creature, stuffing a last meal of pinon nuts before retiring to his winter cave; but Fay's pony reared in terror, plunged forward, kicked out behind, and, as his mistress dropped the bridle, crashed away through the rushes.

Fay ran after him, but only to hear his hoof beats grow fainter and fainter as he ran down the mountain trail. Home was not many miles distant, but she had no idea which way to go. She found herself at the edge of a grove of evergreens. The wet snow was white on the branches.

The faint path that she followed led through the grove, and as she entered it a fairy sound caught her ear.

Jim used to say to Faith that she was the only grown person he had

ever seen who believed in fairy tales. The sound she heard now was strange—like a cry from somewhere among the trees on the mountain side. It was not repeated. If Jim had been with her, he would have said that she imagined it.

Fay went to investigate. The edge of the wood was toward the west. Fay parted the branches of a feathery, dead weed. Under them, waiting like the fairy changelings in the story-books for some one to carry him home, lay a baby. She took him into her arms and, as he was very scantily clad, put him under her plaid cape. He clung to her with his hands like a wild creature. With a rapidly beating heart, Fay looked round for any sign of human beings—cabin, tent or foot-print in the snow. There was nothing.

(Continued Next Week)

## HOUSEHOLD QUERIES

### Jelly from Sweet Fruits

I have enjoyed reading the Cultivator and as you answer so many questions on different subjects I would like to ask, first, about making jelly with sweet fruits that do not jelly well. How much apple juice do you add to make it jelly? To each cup of juice how many cups of apple juice is added—sweet blackberries, apricots, strawberries? I would like to know exact proportions so as to make a good, firm jelly.—Subscriber, Santa Cruz.

With apricot, peach, pear, raspberry, strawberry juice, to one cup add 1 cup crabapple or sour apple juice and ¾ cup sugar to 1 cup of combined juices. If the above sweet fruit juices are to be jellied alone, add only ½ cup sugar to 1 cup juice as they are low both in acid and pectin. Blackberries have more acid and more pectin and may have ¾ cup sugar added. To 1 cup blackberry juice add 1 cup crabapple or sour apple juice and 1 cup sugar to 1 cup of the combined juices. Our inquirer has asked for exact proportions, but of course, the exactness can only be attained by balancing the known pectin, acid and sugar contents. As a practical working rule the above may answer, but only judgment and experience backed by scientific tests will give exact results. The article by A. W. Christie on page 656 of the Cultivator of June 17 gives very definite directions for jelly making with simple test for pectin, also four lists of fruits: (1) rich in pectin and acid; (2) medium acid and pectin; (3) rich pectin, low acid—add acid fruit; (4) low acid, low pectin—add juice rich in pectin and acid. A study of this article will answer nearly every problem of the jelly maker. To judge proper acidity of fruit for jelly making, Mr. Cruess of the food products laboratory gives this simple test: Make lemonade of 1 teaspoon lemon juice, 8 teaspoons water, ½ teaspoon sugar. Taste juice to be jellied, compare with tartness of lemonade, add acid fruit to bring to same tartness.

### Tomato Catsup

Please print directions for making tomato catsup like that you buy in the stores.—Subscriber, Bakersfield.

Following directions are given by W. V. Cruess in "Home and Farm Food Preservation":

Select ripe tomatoes of deep red color. Cook the tomatoes thoroughly and put through colander or sieve to remove seeds and skins. For each gallon of pulp so obtained use: 2 tablespoons salt, 4 tablespoons sugar, 1 tablespoon powdered mustard, 1 tablespoon whole cloves, 1 tablespoon allspice, 1 tablespoon cinnamon, 1 tablespoon pepper, 2 small red peppers cut finely, 1 pint vinegar (preferably cider vinegar), 4 tablespoons ground paprika (not essential but desirable). Tie the whole spices in a bag of cheesecloth and add the other ingredients, except the vinegar. The paprika gives a bright red color and flavor, but may be omitted. Cook until almost thick enough (usually 1½ hours) and add the vinegar. Continue cooking till thick. Pour hot into scalded bottles and cork with corks sterilized in boiling water 10 minutes. The corks are not pressed in at first but left loosely in the necks of the bottles. Put the bottles upright in a washboiler sterilizer with hot water one-half way up the bottles. Heat water to boiling and boil 1 hour with cover on the boiler. Drive corks into the bottles. Allow to cool. Seal with paraffin or wax.

### Hot Weather Milk Drinks

Can you tell me how to make a good old fashioned milk shake.? Also are there other milk drinks that are easy to make?—Subscriber, Fresno.

A fruit jar makes a good shaker. Fill not more than half full, put on rubber, screw top on tight and shake hard. Or a tall jar and a good egg beater will serve very well. Milk should be as cold as possible.

To each glass (¾ glass milk) add about two tablespoons fruit syrup of any flavor desired. Shake thoroughly and sprinkle nutmeg or cinnamon over top. Or add one tablespoon sugar and few drops vanilla.

Milk Shake with Crushed Fruit—Add to milk in addition to syrup or sugar one tablespoon crushed fresh or preserved peaches, pears, figs or other slightly acid fruit.

Chocolate or Coffee Shake—Add strong coffee or melted bitter chocolate, or mocha by combining chocolate and coffee. We do not give proportions because tastes differ so widely and those who like strong coffee flavor usually cannot tolerate a weak mixture.

Macaroon Shake—Make ordinary fruit syrup or vanilla shake and sift crushed macaroons over top.

Egg Nog—Two thirds cup milk, one egg, syrup. Shake and add charged water if available.

## HINTS FROM HOUSEKEEPERS

### Teparies are Good to Eat

Having gotten many helpful recipes and suggestions from your page in years past when we took the Cultivator, I am sending my way of cooking Tepary beans.

Put two cups of Teparies to soak over night, then boil in water to which you have added about one half teaspoon soda. Boil in this water longer than you would ordinary beans, then put into colander and pour boiling water enough over them to rinse thoroughly.

Mix a tablespoon of molasses and a rounding teaspoon of dry mustard; add a medium sized onion (ground), a good sized piece of ground salt pork or fat bacon, (we prefer the bacon flavor), about half a cup of tomato juice. Now put your beans into this mixture. If you have any bacon rinds put over top where they can be removed easily later. Put one half bay leaf, 1 or 2 cloves, 2 or 3 whole allspice, and half a dozen peppercorns into a tea ball and drop into beans; add more water and cook for about two hours with cover tight, then slip cover to one side to let steam escape and cook for another hour.

I cook the beans on top of stove over very low heat, usually putting an asbestos mat under pan the last hour. I use my round aluminum roaster for beans and they seldom stick. Of course, if one is using the oven, one would naturally bake the beans, but I find it much cheaper to cook them on top than to run the oven purposely and no one would know they were not baked.

I hope some of the Cultivator readers will try this method of cooking the Tepary beans and see how delicious they are. I often cook different varieties of beans this same way.

Also, did you know that after using part of an onion one can wrap the remainder in waxed paper and put in cooler or ice chest to use later? The onion stays fresh and does not make anything else taste of it.—A Past Subscriber, Porterville.

### Easy Way to Carry Ice

After reading so many helpful hints from the household department, I must say I find more infornation from the Cultivator than any farm paper I ever read.

Living out in the country too far for deliveries I found it hard to handle ice without tongs until I wrapped it in a large piece of cloth, lifting it by the four corners. In this way it can be laid in the refrigerator without dropping. Wishing the Cultivator success, F C Foster, Burbank.

### Jellied Meat—Jellied Cucumbers

The new recipes for Jell-O in last week's Cultivator made me think of two favorites in our family for company luncheons or hot day suppers. Make lemon Jell-O in regular way, then just as it begins to set add nice bits of lean meat—lamb, veal, chicken or rabbit we like best—highly seasoned with salt, coarsely ground pepper, chopped fresh green or pimento pep-

# Care for your Teeth

In regulating an incubator, running a tractor, or cleaning dairy utensils, great care must be taken to do the work in the *right way*.

It's just as important to clean the teeth the *right way*. A good farmer would no more buy a gritty, soapless dentifrice for his family than he would use a gritty soap to wash the high polish of his car. Nor would he give the children a "druggy" tooth paste with strong chemicals any more than he'd use a spraying material so strong as to burn the foliage of his orchard.

## COLGATE'S

### Cleans Teeth the Right Way

*"Washes"* and Polishes—
Doesn't Scratch or Scour

The U. S. Public Health Service tells us that diseases of the heart, blood, kidneys and joints are often caused by neglect of the teeth. Cleaning the teeth twice a day with Colgate's is a common sense investment in health.

*Colgate's Ribbon Dental Cream has just the combination you need—*

(1) Its specially prepared chalk with *rounded* edges cleans and polishes safely.

(2) Its "washing" quality gently cleans the teeth and inside of your mouth.

If your store doesn't carry *all* the Colgate products listed below, send in the coupon.

C.C.7-22-22
COLGATE & CO.
Farm Household, Dept. 102
199 Fulton Street, New York, N.Y.

per—sometimes a bit of cheese and a few drops of Worcestershire or walnut catsup. This is a delicious meat loaf.

Jellied Cucumbers—Instead of meat add chopped or diced cucumbers, green onions and fresh or canned pimentos. Slice, serve on lettuce leaf and add teaspoon mayonnaise to each plate.

### Ripe Tomato Relish

Tomato time is around again, and I am sending a recipe that we think is splendid. I got it years ago out of the Rural Californian, now out of print:

One peck tomatoes (peel and chop), let drain over night in a colander; in the morning chop and add 6 onions of ordinary size, 2 bunches chopped celery, 2 tablespoons mustard seed, 1 tablespoon celery seed, 4 chopped red peppers, ½ cup salt, 6 cups brown sugar, and 6 cups cider vinegar. Mix all together and seal in jars without heating.—Beulah May, Santa Ana.

(It seems good to hear from the Rural Californian again. It was a pleasure to work with our household readers in getting out that little monthly magazine, and we are glad to know that Miss May has been saving this good recipe so that it may make its appearance in the Cultivator.—Edit.)

### TO SET COLORS IN WASH GOODS

"Just because they are faded, many garments with lots of good wear left in them are discarded before the material is worn," says Azalea Linfield, clothing specialist in South Dakota state college.

In homemade garments the colors should be set in cotton and linens before making, in ready made garments set the colors the first time they are laundered.

Directions for setting colors follow:

Blue—One half cup vinegar, one tablespoon powdered alum, a gallon of water cold). Keep material in solution two or three hours.

Pink and black—One cup salt, one gallon cold water. Keep material in solution for two hours.

Lavender, yellow, light green and red—One ounce sugar of lead, one gallon boiling water to dissolve the sugar of lead. Keep material in solution for two or three hours.

Leave the material folded and be sure that it is entirely covered by the solution. Move occasionally so that the material will be entirely soaked through. After leaving in the solution for the required length of time, remove and press water out, but do not wring. Rinse in cold water and hang out as before. Hang to dry in a shady place. Iron on wrong side of material.

## Vitamines in Cooked and Canned Foods

DOES cooking foods at high temperatures in steam pressure cookers and canners destroy vitamins? This question comes frequently to the Cultivator from those who would like to adopt the convenience of steam pressure cooking but are cautious about giving up the old way until assured the new way is better as well as easier and quicker. This same question, it seems, has been coming to the commercial canneries, and in order to answer it conclusively, they have put it before Dr. E. F. Kohman of the Research Laboratory of the National Canners Association at Washington. He has made careful study and consulted authorities on the subject and his research demonstrates that canned foods supply the vitamins as abundantly as the same foods cooked in the ordinary way. The vitamin content is the greatest when foods are at the proper stage of maturity for consumption and decreases when the foods are held for a period of time. The fact that canned foods are prepared in their prime and must be in this condition for canning is in favor of the canned product.

Canned tomatoes are said to be among the richest sources of all vitamins in any product. On the strength of their content of the antiscorbutic vitamin, canned tomatoes have been recommended by physicians to supplement pasteurized milk in infant feeding. Special use was also made of canned tomatoes in army rations because of the vitamins in them. Canned tomatoes have been stored for three years and still found apparently as rich as ever in vitamins. This is longer than the antiscorbutic vitamin, which is the least stable of them all, can be kept by any other known method.

Canned foods are processed in vacuum while foods cooked on the stove are exposed to the air, which is the cause of a considerable loss of vitamin C. From the experimental evidence now available canned foods are found to be practically as rich in vitamin A and B as the corresponding fresh raw products. In acid products, such as tomatoes and fruits, there is only a negligible destruction of vitamin C by ordinary cooking or in the canning process.

### What Are Vitamins?

In view of the popular discussion of vitamins and what they actually are, their function is interesting. Dr. Kohman says:

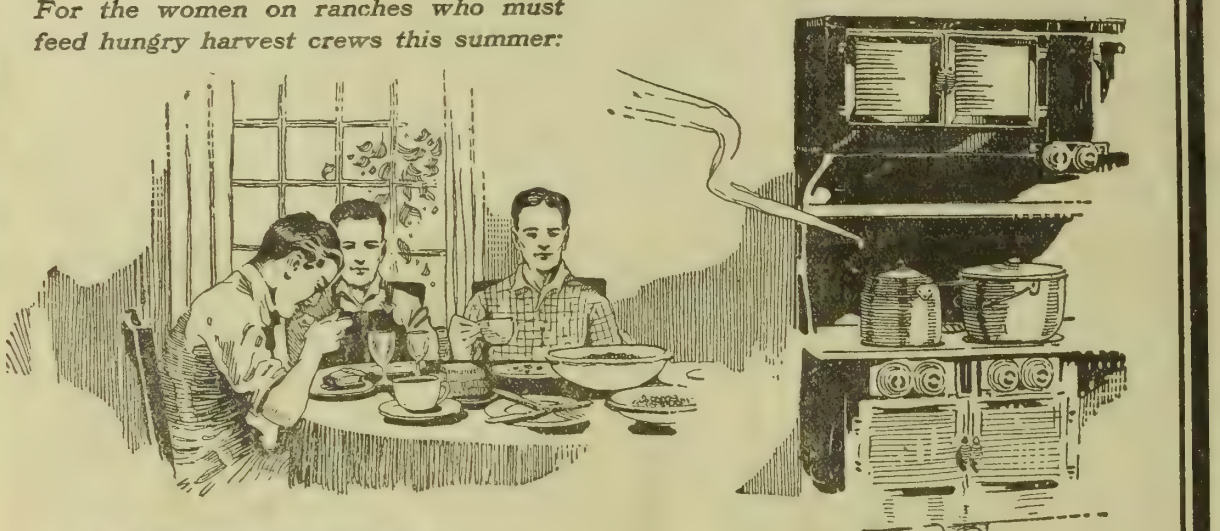
"They supply the body with neither energy nor tissue building substances. They may be likened to a spark plug. The energy produced in the spark plug does not aid in propelling the engine nor is the fuel of any account in running the engine so long as it remains in the form of gasoline. The spark plug, however, ignites it, producing a change whereby it does become useful as a source of energy. By some means, still unknown to us, the vitamins enable the body to utilize the energy producing and tissue building components of our foods which would be useless to us without the vitamins. They play a part in addition to the role of the spark plug in that they have something to do with the construction of the engine; that is, they regulate the assimilation of the tissue building portions of the diet.

"The vitamins are also different in properties, so far as we know their properties, from other food constituents. They are active in extremely minute quantities. In this respect they bear about the same relation to the rest of our food as the energy produced by the spark plug bears to that generated by the gasoline."

At present it is universally agreed that there are at least three vitamins. These have been given a variety of names, but the simplest designation is to call them Vitamins A, B, and C. Vitamin A is found in milk and eggs, largely in their fat, in other animal products, particularly grandular tissues, in animal fats and fish oils, and in vegetables, especially the green leafy varieties. It has been found to play an important part in the growth of bones, although it has other, though less clearly defined functions in the life of both young and old.

Vitamin B is widely distributed in all classes of natural food; in seeds, vegetables, and animal products. Its absence in the diet is concerned in the disease known as beriberi in man and polyneuritis in fowls. It is there-

*For the women on ranches who must feed hungry harvest crews this summer:*



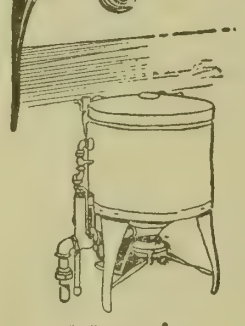
# Electrical Kitchen Appliances are "Labor Savers"

HUNGRY CREWS, coming from the fields, require great quantities and a large variety of food. Before the dishes can be washed and put away, it is time to start preparing the next meal.

The housewife who faces such a task needs "Pacific Service" back of labor-saving, electrical kitchen appliances. She needs an electric range to enable her to prepare the great quantities and variety of food that the hungry harvest crews must have. She needs an electrical bread mixer to handle that heavy task, while she takes her dishes, all clean and drained, from the electric dish washer. An electric churn should be working, while she feeds clothes rapidly into her electric ironer. The electric water heater, ice box, cream separator, bottle washer, sewing machine and vacuum cleaner are other electrical appliances that are great "labor savers" for housewives on ranches.

All of these appliances and many others can be operated wherever the local distributing lines of the P G and E run. Every farm woman should investigate their labor-saving possibilities.

Call at the P G and E office the next time you are in town and ask for further information.



Electric Dish Washer

"PACIFIC SERVICE"

P-05:7-5 Farm

fore known as th antineuritic vitamin. It may have some function in controlling the appetitie. Vitamin C occurs abundantly in fruits, succulent vegetables and tubers, and in milk. Its absence in the diet results in scurvy, and hence it is called the antiscorbutic vitamin.

### Vitamins in Canned Foods

It is said fruits and vegetables in their prime are richer in vitamins than those which are left to stand around for ripening purposes or are held over for later sale. Therefore, the interesting argument is advanced that canned foods, which must necessarily be packed immediately after ripening, contain considerably more vitamins than the partially ripe fresh foods. For instance, it has been shown that ripe tomatoes are richer in Vitamin C than partially ripe tomatoes.

"No one should infer that raw fresh foods should be dispensed with in the normal human dietary," says Dr. Kohman. "This would be contrary to the universal belief among physiologists and students of nutrition. Those foods which can be eaten raw should always be so eaten as far as possible when they can be obtained in the fresh state, at reasonable cost. When they are out of season, inconvenient, or uneconomical, their place can well be taken by canned products, as evidence shows that canned foods are as nutritious as ordinary cooked foods.

### Man Must Choose His Diet

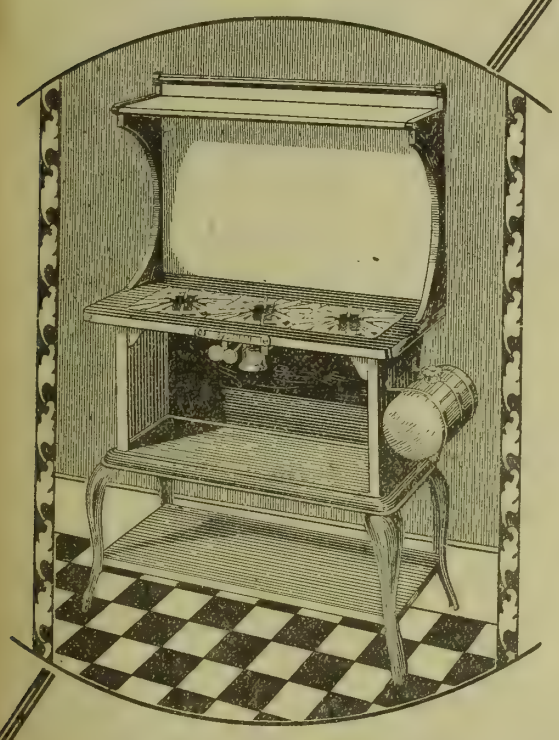
"Animals in the wild state, when the food supply is plentiful, are safely guided by instinct and appetite to choose a diet adequate for all their needs. With civilized man this is not always the case. His instinct and appetite often seem to be sophisticated, and many times his free choice is made impossible by social and economic restrictions. A diet even when composed entirely of raw products, must, therefore, be chosen with intelligence to insure its adequacy.

"A consideration of all the recent experimental evidence convinces one that it is possible to select a diet, entirely of canned foods, which is complete and adequate for long continued nutrition; a diet in which all the known vitamins are represented in sufficient amounts, having such a variety of proteins that no animo acid will be slighted, and supplying all the necessary mineral salts. These more fundamental substances will unavoidably be accompanied by a variety of fats and carbohydrates whose primary function is to supply us with heat and muscular energy.

# Coleman Cookers

*Make their own Gas*

## Just Like Natural Gas



1—The clean convenience of natural gas.

2—Makes its own gas from motor gasoline.

3—Gives you the cleanest, quickest, hottest fire ever produced.

4—Has perfect flame regulation—simple and easy to adjust.

5—No wicks, no cones or chimneys, no smoke, no ashes; clean, safe and economical.

6—Will cook an average meal on about 2c worth of fuel.

7—Sturdily built for lang service;—complete with one gallon fuel tank—or larger if wanted.

8—This is the ideal cook stove for family use in home or mountain cabin.

## COLEMAN COOKERS

### Make Their Own Gas

The most advanced achievement in stove engineering for use where natural or artifical gas is not available. Coleman Cookers provide efficient gas service for all cooking and baking purposes in any home. All the bother and trouble common in ordinary oil stoves are eliminated for Coleman Cookers are real gas stoves with all the convenience, cleanliness and comfort found in the city kitchen. There is no reason, now, for any home to continue using smoky, unsatisfactory oil stoves.

Gasoline under pressure gives a hotter fire than gravity gasoline, oil wick or oil vapor stoves. The Coleman burner produces the most heat for the least money. The complete stove is clean, simple to operate, and is built for hard service. You can have all the way from a slow simmering fire to an intense heat that will boil a half-gallon of water in 4 minutes. The flame does not "crawl up" and smoke your cooking utensils. Only one working part—the generator. No valves to fuss with or to clean and replace.

**Ask your nearest hardware dealer about Coleman Cookers. If he can't show you a sample and demonstrate the superior merits of Coleman Cookers, write us at once.**

## THE COLEMAN LAMP COMPANY

120 South Los Angeles St. Los Angeles, Calif.

## With 2½ Cents Worth of Kerosene and a Superior Oil-Gas Burner

In your cook stove you can have a baking oven for 1 hour. If there is a water coil in the firebox you will have an abundance of HOT water. The entire top of the stove is heated which is ample in size to cook a meal for a large family. In cold weather the whole house will soon be comfortably warm, and in hot weather the fire can be shut off as soon as the meal is cooked.

By making a pure gas from the oil and then burning it in a cast iron container (cook-stove) the highest possible efficiency is obtained. Write us today for our literature. Tell us what you want to heat and we will tell you how to do it.

259 Market Street, San Francisco

### FOR HOUSEKEEPERS TO TRY

By A. M. H.

Try putting up a few cans of corn in this way without cooking. Take green corn and shave it off with a sharp knife but don't scrape the cob, then put one cup of salt for every two cups of corn, and seal it up in glass jars. Soaking in two waters from breakfast to dinner will bring it out fresh for cooking.

If a bunch of grape leaves is put in the brine in which cucumbers are to be soaked for pickling it will help keep them sound, firm and of good color.

Instead of laboriously scraping carrots, wash them clean and boil with skins on and when done let cold water run into the pot until you can slip the skins off by hand. Young and tender carrots are delicious with a cream sauce, and they are also among the most wholesome of vegetables.

Try putting the thinnest coat of mustard on ham, adding one teaspoon of vinegar to about two slices before frying. It is a great improvement. To make extra good ham sandwiches, make a dressing of half a cup of butter, one tablespoon mixed mustard, a pinch of salt and pepper and the yolk of a hard boiled egg. Rub the butter to a cream, add the other ingredients, then stir in as much chopped ham as will make it spread well between slices of thin bread.

Glass jars and cans that have not been well cleaned and sterilized cause much loss of fruit, and the easiest way to clean them is to put as many in a large dish pan or boiler as it will hold without crowding, cover with warm water and sprinkle enough borax soap chips over them to make a good suds and let boil for half an hour or longer. Rinse with clear hot water and set in the sun to air for a day or two. Boil the caps at the same time, and all bottles that are to be used for catsups and fruit juices are freshened in the same way.

The refrigerator is kept purely clean by scrubbing out once a week with hot soap chip suds, then rinsing with clear hot water and leaving open to cool and air before replacing the contents. The same suds is excellent for cleaning the pantry floor and shelves and for the kitchen floor and tables.

If you have no milk for toast, work a heaping tablespoon of flour into two of butter, add a pint of water and let it boil. Season with salt and pepper and pour over the toasted bread. Milk toast is improved by adding a pinch of pepper and salt to the milk while it is heating.

### FRESH FRUIT—ESPECIALLY IN HOT WEATHER!

Fresh fruit furnishes a valuable part of the meal, stimulates the appetite, cools, refreshes, and is easily assimilated. Especially in hot weather fresh fruit is doubly welcome at meal-time, says the California department of agriculture.

Grapes, for instance, contain blood building constituents such as sugar, potash, salts, phosphoric acid, lime and iron.

Apples and pears contain phosphates, lime, albumen, and malic acid, and act as gentle laxatives.

Cherries and plums furnish phosphates, sugar and nitrogen.

Berries are good tonics for their acids, and salts of lime and iron.

Oranges are blood makers and laxatives.

Melons are largely water in combination with sugar and starch.

Lemon juice taken regularly is a valuable laxative with a pronounced beneficial effect on torpid livers.

In children's diets oranges, berries or acid fruits should not be given along with milk. Continued use of fresh fruits will promote intestinal activity and reduce acidity of the blood.

Fruit has ceased to be a luxury. Even at higher prices for standard grades it is a wise and excellent investment.

We believe that all people were put on earth for some useful purpose, but we also believe that nobody ever will find out what the purpose of some of them is.

## The Cultivator Patterns

**4050. Ladies' Dress**—Cut in 6 sizes: 34, 36, 38, 40, 42, and 44 inches bust measure. A 38 inch size requires 5⅝ yards of 32 inch material. The width of the skirt at the foot is 2⅜ yards. Price 10 cents.

**4063. Boys' Suit**—Cut in 4 sizes: 4, 6, 8 and 10 years. It will require 3⅝ yards of 27 inch material for a 6 year size. Price 10 cents.

**3807. Ladies' House Dress**—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 38 will require 5¼ yards of 36 inch material. The width of the skirt at the foot is 1⅞ yards. Price 10 cents.

**4041. Ladies' "Over" Blouse**—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires 2⅜ yards of 32 inch material. Collar and cuffs of contrasting material require ¾ yard 40 inches wide. Price 10 cents.

**3640-4046. A Good "Sports" Costume**—Blouse 3640 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It will require 3⅛ yards of 36 inch material for a medium size. Skirt 4046 is cut in 7 sizes: 25, 27, 29, 31, 33, 35 and 37 inches waist measure. A 29 inch size will require 4¾ yards of 40 inch material. With plaits extended lower edge of skirt measures 3⅝ yards. Two separate patterns, 10 cents for each pattern.

**4056. Girls' Dress**—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size requires 3 yards of 40 inch material. Price 10 cents.

**4066. Ladies' House Dress**—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 5⅜ yards of 32 inch material. The width of the skirt at the foot is 2½ yards. Price 10 cents.

**4045. Ladies' Negligee and Cap**—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A medium size requires 2⅝ yards of 32 inch material. The cap alone requires ½ yard. Price 10 cents.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

**CATALOGUE NOTICE**

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

# Feeding Dairy Cows---No. 5

By E. J. Sturgis

## FITTING AND SHOWING

AFTER its high production records the next best advertisement for a herd of pure bred cattle is its show ring winnings. There is a tendency on the part of some breeders to overvalue high records and to consider them so important that individuality and conformation is of secondary importance. Individuality and conformation should hold equal place and the sales ring proves that this is so in nine cases out of ten.

In the show ring of course individuality holds the center of the stage as in all but the advanced register classes the conformation of the animal is what counts. The animals are judged purely and simply from the way they appear in the ring so that in picking out a show herd all sentiment and regard for high records must be set aside for the time being and the cold, hard facts of the animal's appearance be the sole guide in its choice. If the breeder does not feel sufficient confidence in his own judgment to pick out his herd he will be able to get assistance from his farm advisor or some one of the men connected with the farm papers.

### Salient Points

There are a few general things that must be watched closely in picking show animals. First of all they must have good top lines and tail sets. These two generally go together, and animals that are straight on top are usually good and straight in the tail. In the females the udder is of wast importance and is judged on size, placement and texture. It should be long and straight, set well forward and hung high behind, with the teats of good size placed squarely on the corners. It should not be meaty. In the males the rudimentaries which correspond to the udder on the cow are given considerable attention by most judges and should be long and well placed as they are an indication of the udders which their daughters will carry.

The females should be feminine in appearance and show dairy temperament as against the easy feeding, show moving temperament of the beef cow. The animals should have prominent shoulders and a long barrel with a good spring of rib, all of which show great capacity. They should have plenty of depth and heart girth in order to have sufficient breathing space. They should be well filled back of the shoulders. With these few points in mind the breeder can pick out the ones he thinks best, and if he is in doubt he can get aid as suggested above.

### Fitting

Show animals should be tied up under cover for at least six weeks before the show. There has been a tendency with some breeders to neglect their show strings until near the time for the first show, which in this state is generally the state fair, and do most of the conditioning and fitting at the fair grounds. If every one did that way it would be all right but some men prefer to show a well fitted herd at the state fair, and after a few sad experiences the lax ones have learned to come prepared.

For putting on the soft fat which rounds, the animal into show condition I use equal parts of ground oats, bran, corn meal and linseed oil meal. I feed about four quarts of this a day to yearlings and up to 20 pounds to the mature animals. For the young animals I like to feed oat hay once a day with alfalfa before them the balance of the time. Calves under a year should have plenty of skim milk which gives them size and quality. A tablespoon of oil meal in the milk will help to make them sleek. Green alfalfa to the entire herd once a day is a good thing.

When they are first tied up they should be washed with some good laundry soap and plenty of water. If the weather is warm, as it usually is at this time of the year, allow them to become nearly dry before blanketing. If a cold wind is blowing, blanket at once. A wool blanket next to the skin with a canvass or burlap blanket over that will provide plenty of covering. For the period of fitting before going to the show, beet pulp sacks sown together make a cheap and sufficient covering for most animals. Do not wash any oftener than is absolutely necessary to keep the animals clean as soap and water tends to dry the hair, take the oil out of the skin and make it hard. Daily brushing and rubbing are much better. About six weeks before the show trim the feet so the animals stand on their toes.

### Training

In most herds there are young animals which have not been broken to lead. This is an important item of show training as there is nothing more annoying in the show ring than an animal which refuses to stand or lead as required. It is an injustice to other breeders to show such an animal as it usually crowds or balks and throws the entire ring into confusion. Wild youngsters can easily be trained if they are tied up and left without water for a period of from 12 to 20 hours and then led to the trough. Being led to water twice a day helps to tame them, and they should be taken out and trained to pose. If at first they refuse to lead to the water they can be tied to a big, gentle cow and she will usually act as a persuader.

Two weeks before the show clip any animals which have not shed sufficiently. The ones that show a good coat of hair should be clipped on the head and neck, taking care to blend the clipped and unclipped portions so that a line does not show along the back bone and tail head and the tail, but be sure to leave plenty of switch, on the udder and under the belly.

A show box should be prepared which will carry the show blankets, halters, brushes, etc. There should be horn scrapers, emery paper and tripoli powder and sweet oil with which to keep the horns in condition. Household ammonia for taking off stains and bluing for using in the rinse water for white cows should be included. There should be a bottle of iodine to use on scratches, plenty of salts, and powdered alum. This last is put in the rinse water used for the switch before braiding and helps to keep the switch in curl when it is combed out.

Carry your own rake, forks, hose, feed buckets and water tub. None of these things are furnished, and you will be more popular with your fellow show men if you do not have to borrow. Paint them some distinctive color so that they will not be easily lost or carried off.

### Registrations and Entries

Be sure that all of your show animals are registered and tuberculin tested. Carry the papers for both with you at all times. Make your entries early and help the fair secretaries to be ready for you when you arrive. You can ship your stock to the state fair and back home again free of charge. If you go to the other fairs you have to pay half fare. Be sure to route your stock back to the place from which it started.

Keep the stock blanketed until time for the show. After the judging it is courtesy to blanket them only at night. The spectators come to see the animals, not the blankets.

The night before the judging feed plenty of salt and do not give much water. The animals will be ready to drink their fill the next morning. Lead them out to drink about 20 minutes before time to take them into the ring. This allows them to recover from the effects of the cold water and they will not go into the ring shivering. Do not let them drink too much water. They should be just well filled.

Cows in milk should show with from 25 to 30 pounds of milk in the udder, and one can easily judge when to milk them out in order to have that amount.

46 REGISTERED 46
SHORTHORNS
At Public Auction
Carruthers Farms, Live Oak, Calif.
Wednesday, August 9, at 1 P.M.
In this offering Mr. W. M. Carruthers will sell all of his heifers above weaning age, some choice cows, and a group of good bulls, mostly all of attractive Scotch breeding.
31 HEIFERS—4 COWS—11 BULLS
Guaranteed breeders, tuberculin tested, and sold on terms of one-half cash, balance in six months to all who make arrangements for such credit with sale managers prior to sale.

## Livestock News Notes

### LIVESTOCK SALE CALENDAR

**Shorthorns**

August 9, Carruthers Farm, Live Oak.

**Guernseys**

August 4, L. D. Smith, Riverside Fair Grounds.

**Holsteins**

August 17, Jas. McGillivray, Sacramento.

The consignors to the Sutter County farm bureau hog sale at Live Oak on Wednesday, July 12, were very well pleased with the returns from the sale, one carload being sold to J. W. Walker of Marysville, and shipped to Alden and Agnew, Oakland, at $11.05 per 100 for tops hogs. Local buyers were offering from 10 to 10½. The demand for hogs seems to be very keen for this time of year.

On Thursday, August 17, a complete dispersal of the registered Holstein heifers in Willowmead herd, owned by James McGillivray, Sacramento, will be made at public auction. The 140 bred and open heifers in this sale make it the largest heifer offering ever made in a western sale. Particular attractiveness attaches to the offering because of the clean record of health and the fact that all heifers over six months old will be sold subject to 60 day retest by the buyer.

Irene Segis Pontiac, a junior four year old daughter of Finderne Pride Johanna Korndyke, lately completed a 365 day record of 1,008.75 pounds butter from 23,301.3 pounds milk. She has the same sire as the great junior 4 year old Kiatta Pontiac Pride that finished not long ago with 1,138.25 pounds butter from 31,489.1 pounds milk in 365 days. Both of these heifers are owned by Palo Alto Stock Farm, Palo Alto.

Vic Bello, formerly herdsman for McFarland's Steybrae Farm at San Mateo, is now in charge of the North Oaks Ayrshire Farm at Novato. This herd is owned by Robert H. Trumbull

of San Francisco and Novato. Vic had the pleasure of winning first on his bull Mac's Statesman of Elkhorn at the Western Sonoma and Marin Fair last month.

Santa Anita Rancho has sold the great Poland China show sow, Miss Big Price, to H. C. Merritt, Jr., of the Tagus Ranch at Tulare. She will be a feature of the Tagus show herd.

Queen Sadie Vale Veeman Karlray, a five year old Holstein owned by the Berylwood Stock Farm, has just finished a 30 day record of 127.45 pounds butter from 2386.9 pounds milk. Her last seven days was the best, and during that time she made 31.5 pounds butter from 616.3 pounds milk.

Belle Pontiac Korndyke Daisy, a junior two year old daughter of King Korndyke Pontiac 20th, has increased her former seven day record in her fourth month in milk, making 19.05 pounds butter from 484.5 pounds milk. She dropped twin heifer calves by Sir Aaggie Mead, and is making a splendid showing on yearly test, Winnie Walker, a junior two year old daughter of Sir Aaggie De Kol 2d, recently made 17.32 pounds butter from 434.1 pounds milk in seven days during a hot spell when the thermometer ran as high as 112 degrees. Both of these good heifers are owned by F. S. Borror & Son, Tipton, whose herd has already gained a place among the top herds of the San Joaquin Valley.

The recent national sale of Ayrshires held at Devon, Pennsylvania, in connection with the annual meeting of the Ayrshire Breeders Association, made a very satisfactory average. The sale included 42 animals from 18 herds and averaged $510 per head. All animals sold were from federal accredited herds or from herds that had passed one federal test without a reactor.

California has four out of the 25 leading prize winning sires in the production prize list of the Holstein-Friesian Association of America for the year 1921-1922 lately published The four, with amount of money won by daughters of each, are King Segis Alcartra Prilly, $230.25; Prince Gelsche Walker, $187.75; King Pontiac Netherland Segis 3d., $176.15; Segis Pontiac De Kol Burke, $147.75. Daughters in California of the eastern sire, Finderne Pride Johanna Korndyke, were also responsible for his position among the first 25 money winning sires.

Maud Netherland Wayne De Kol 2d, owned by Dr. W. H. Ketchum, Palo Alto, lately completed a 365 day record of 1,312.10 pounds butter from 32,631.9 pounds milk. This gives her the third highest yearly milk record and the sixth highest yearly butter record yet made in California.

The H-G Ranch at Buellton in the Santa Inez Valley recently sold 20 head of two year old grade Ayrshire heifers to a farmer in the Sisquoc Valley. This is a "repeat" order as this farmer already had a large number of H-G bred cows. They also report the sale of a pure bred bull to the same party. All the heifers were bred to that good bull "Steybrae Robin Quechy."

The Southern California Purebred Livestock Association is attempting a very comprehensive survey of the livestock situation in the southern counties, and a strong effort will be made to secure a complete and reliable census of the conditions relative to the number of beef and dairy cattle, hogs and sheep, present feeding conditions and local consumption demand. Southern California is supplying only a comparatively small part of its consumptive demands of beef, pork and mutton and in every county there are undeveloped resources which can be and should be applied to increasing production. The chambers of commerce and farm bureaus in each county have been asked to assist the members of the association in each county in securing this survey.

Copa De Oro Holland Bawn, owned by Arthur & Maxfield Holstein Co., Hanford, becomes the first 1,000 pound cow developed in Kings County, with a production of 1,103.45 pounds butter from 26,234.0 pounds milk in 365 days. She is a daughter of the well known sire, King Holland Paul De Kol.

Charles Harrington, Compton, has added another to the splendid yearly records made in his good herd when Oakfield Korndyke Adele 2d finished a 365 day record with 938.88 pounds butter from 20,839.9 pounds milk.

Ormsby Mechthilde Prilly, that calved at three years, three months with her first calf, has just completed a 365 day record of 1,017.59 pounds butter from 24,258.3 pounds milk in the Bridgford Holstein Co. herd at Patterson. She is a daughter of the sensational sire King Segis Alcartra Prilly and his second daughter to make above 1000 pounds butter with first calf. A new world's record has just been made in the Bridgford herd by the heifer Fairmont Colantha Prilly. Calving at 26 months of age she has made in 305 days 853 pounds butter from 20,067 pounds milk, giving her the world's records for butter in the 305 day division of the junior two year old class. This great heifer is a three-quarter sister to King Segis Alcartra Prilly, being by the same sire, King Segis Pontiac Alcartra, and out of a daughter of the Prilly bull's dam.

The Cultivator is in receipt of a letter from a Mexican breeder who wants to buy a carload of Holstein cows in milk. Letters addressed to Livestock Editor, California Cultivator, Los Angeles, will be forwarded to the prospective buyer.

The farm bureaus of Sonoma and Marin Counties have united on a pure bred sire campaign and have issued a very comprehensive leaflet showing the results which have been obtained in that district by the use of pure bred bulls. A survey which shows that 14 dairymen with 530 cows sired by pure breds produced $73,196.32 worth of butter fat in 1921 while 13 dairymen with the same number of cows sired by scrubs produced only $43,433.90 worth of fat, or an average loss of $2,289.47 to the man who champions the scrub bull.

The date of the Los Angeles County Fair at Pomona has been changed to Oct. 17 to 21. This completes a southern circuit of Ventura, Riverside and Pomona, and as all are big shows many of the breeders will undoubtedly be present.

D. F. Conant of Modesto has sold 11 milking cows and a bull from his Jersey herd to Louis J. Romer of Ukiah. Three of the cows were full sisters by Pansy's Gertie Lad, and the grandsire on the dam's side was a son of Lady Letty Lambert. One of the sisters has a record of 742 pounds fat. Seven of the others were daughters and granddaughters of the three cows, and the other is Mamie Owl whose record of 435 pounds fat as a junior three year old was a state record for several years. Mr. Conant says there is a big demand for Jersey cows now.

The report of the U. S. department of agriculture on tuberculosis eradication work for May shows that during that month 60 herds were tested in California. 3,184 cattle were tested and 113 reacted which was a remarkably small percentage since this was the first test. The waiting list shows 12 other herds which have applied for the test. 41 herds in the state have passed one test without a reactor.

Golden Eminent's Fairy Girl 449980, owned by H. G. Gross, Eureka, is the new yearling champion Jersey of California. In 362 days she produced 9,195 pounds milk, 529.35 pounds butter fat, starting test at one year and ten months of age. On this record she wins a silver medal, having carried calf 284 days during test. Her sire is Raleigh's Fairy Boy 9th 113825, a noted Register of Merit sire, and her dam is Olds' Golden Eminent 297220.

The second annual combination sale of the Eastern Guernsey Breeders' Association, held at Devon, Pennsylvania, June 14, resulted in an average of $1,118 on 48 head. Three bulls averaged $850 and 45 females $1,114.

CALIFORNIA BREEDERS SALES AND PEDIGREE CO.
C. L. Hughes, Sales Manager, Sacramento, Calif.

You Should Not Buy a Bull Unless:

You have seen his dam and know that she is the type you want his daughters to be.

Or you have seen a good picture of her with a close-up picture of her udder.

She is a big producer of milk with a high percentage of fat.

Our cows are the tops of all the big sales in the state for the past three years.

Practically all of them have high 7 day and yearly records. They hold 4 world's records. Our herd bull is Sir Aaggie De Kol Mead, whose five nearest dams average 1130.66 pounds of butter in a year testing over 4%.

You should have one of his sons out of a high record dam.

Call or write for our long-time, easy payment plan.

Lankershim, Cal. Fred Hartsook RANCH Visitors always welcome.

MR. FARMER:—

You are contemplating the purchase of a service bull next year. Why not save 50 per cent of the purchase price by buying a registered Holstein bull calf now? Pay for him next year when he is ready for service.

Sons of SIR VEEMAN KORNDYKE PONTIAC, who has 27 A. R. O. daughters, and of BURR WALKER SADIE VALE, whose seven nearest dams average 29 lbs. of butter in 7 days, included in this offer. Call or write at once.

produce practically all of the milk in this country which sells at a price considerably above the market price of ordinary milk. Guernsey grades produce the same kind of milk and they are in demand at good prices.

Every grade dairyman should own the best Guernsey bull he can buy. Write us if you want Guernseys.

ROSEMOOR FARM
W. H. Dupee, Owner Riverside, Calif.

Stock Farm at Hueneme, returned from a vacation in the northern part of the state and the San Joaquin Valley, with 49 head of Holsteins to add to his big herd. Thirty-six of the number are open heifers which are to be bred to Prince Aaggie of Berylwood, the highest record bull on the Pacific coast. Many of these heifers are out of yearly record dams and sired by yearly record bulls. One of the heifers is a daughter of Norma Korndyke, the Hartsook cow which recently made 42.8 pounds of butter in 7 days. One of the purchases was of a mighty good aged bull to replace the former senior herd sire which died recently. This bull is sired by Sir Bessie Fobes Tritomia and is out of the well known cow, Fay Tritomia Hengerveld, which made 30.4 pounds butter in 7 days. He is therefore a half brother to Fay Tritomia Hengerveld Walker, the state record 3½ year old also in the Berylwood herd, and of Fay Tritomia Hengerveld 2d who sold in the last guaranty sale for $975. This bull is also a tried sire as his daughter, Queen Pietertje Hengerveld Fobes, also in the Berylwood herd, is making about 25,000 pounds milk and between 750 and 800 pounds butter as a senior yearling and is expected to break the state butter record for her age. With the bull Mr. Snodgrass got seven of his daughters, three of whom are due to freshen in a short time.

Santa Paula set an example in Fourth of July celebrations that could be followed by any farming community with decided success, by making a livestock show one of the main features of its big day. Exhibits of livestock, horses and mules and dairy cattle, took part in the parade and served for judging classes later. One of the features was an exhibition of Holsteins from the Berylwood Stock Farm, and another was the show put on by the Ventura County Calf Club. This club now has 12 members and is rapidly expanding. The calves were judged by G. E. Gordon of the extension department U. of C., and Baird Snodgrass won first place.

## LARGE SALE OF REGISTERED HOLSTEIN HEIFERS

The largest sale of registered Holstein heifers ever made in the West will be on Thursday, August 17, when a dispersal of the 140 heifers in Willowmead Herd, owned by James McGillivray, Sacramento, will be effected at public auction. This is a sequel to the sale about a year ago of the registered cows in Willowmead Herd, following which Mr. McGillivray leased his ranch on Freeport road to commercial dairymen. A commanding feature of this sale is the fact that the heifers have been raised on milk from tuberculin tested cows, turned into clean pastures at weaning time, and in making the test for this sale a total of 175 head were tested, including the cows furnishing milk for the calves, and only a single reactor was found, that one a calf recently brought over from another ranch. The heifers over six months old will be sold subject to 60 day retest by the buyer, another unusual feature.

A very large group of these heifers are sired by Prince Echo Sylvia Segis whose sire is Champion Echo Sylvia Pontiac, the son of May Echo Sylvia whose daughters are making such sensational records at present. Another large group is sired by Colony Zarilda Newman whose dam in heifer form made over 30,000 pounds milk and over 1000 pounds butter in one year, and as a mature cow made over 33,000 pounds milk and over 1100 pounds butter in one year. Other heifers in the sale include granddaughters of such noted sires as King Mead of Riverside, Prince Gelsche Walker, and King Valdessa.

The sale will be managed by California Breeders Sales and Pedigree Co., with Col. Ben A. Rhoades, Los Angeles, as auctioneer, and will start promptly at 9:30 a. m., as this will be the largest number of registered Holsteins yet sold in one day in California.

## CALIFORNIA FALLS INTO LINE

By C. L. Hughes

California has at last joined the ranks of states cooperating with the U. S. bureau of animal industry in tuberculin testing of cattle to secure federal accredited herds. This is a result long sought for my many progressive California breeders. Possibly the real pioneer in promoting the idea was Horace L. Hill, Jr., owner of Toyon Farm, Los Altos, who tried unsuccessfully for several years to secure the cooperation of this state with the federal government, as he was particularly anxious to have a federal tested herd. He finally succeeded in a way by purchasing an entire federal accredited herd in Minnesota and shipped to California with the distinct understanding that the federal department would continue testing the herd after arrival in this state. This accounts for the fact that Toyon Farm had a federal tested herd at a time when it was not possible for any other California breeder to enjoy the same privilege. California Holstein-Friesian Association finally took up the task which Mr. Hill had started and was the first association of cattle breeders in California to go on record as favoring federal testing. At a directors meeting on May 4, 1920, a resolution was adopted favoring the introduction of the necessary bill in the then coming session of the legislature. At a general meeting of the association at Los Angeles on June 16, 1920, Dr. J. P. Iverson, chief of department of animal industry, at Sacramento, was present by invitation and explained that his department wished to introduce a bill providing for area eradication work by the state, and that the federal bill could be introduced at the same time. The area eradication bill was duly introduced, known as Senate Bill No. 98, but it remained for Assemblyman Cummings of Humboldt County to introduce the bill providing for federal testing in Assembly Bill No. 38. A keen fight developed on Senate Bill No. 98, primarily because of glaring faults in its original draft, but it was eventually amended, passed, signed by the governor, and is now law. Assembly Bill No. 38 received its most active support in the legislature by the association, the secretary and members of the board of directors appearing before the ways and means committee at a time when it looked as though the bill might be killed through the appropriation which it carried. Mr. Cummings finally eliminated that section of the bill providing for an appriation and in that form the bill was passed, signed by the governor and is now law. Approximately a year was required after the bill was signed before the federal department and the state signed the necessary agreement to permit the work to proceed, but the plan is apparently now in working order and many California Holstein breeders who have wanted the federal test now have it available.

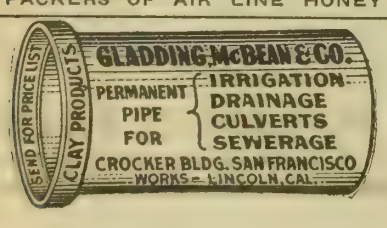
PACKERS OF AIR LINE HONEY



# Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Worms.

Please advise us through the Cultivator what to do for a cat with worms. He is very thin and has vomiting spells and this morning vomited some worms about two inches long.—Subscriber, Fresno.

Get of your druggist ten powders each containing ten grains powdered areca nut. Every morning stir one powder into a tablespoon of fresh milk. The cat will probably eat it as there is very little taste to the areca nut, but if he will not then spoon it down him. Also get of the druggist a small package of catnip. Throw some of it down on the floor near the cat every day or two.

### Bloody Wart.

We have a mule that has a bloody wart on her leg that bleeds badly at times. Please tell us what to do for it.—Subscriber, Fresno.

Get an ounce of nitric acid and with a small swab wet the top of the wart once a day for three days with the acid, then stop until the scab comes off. Repeat this until you think the wart is cured. Be careful in handling the acid as it is very caustic. It will burn the skin or clothing. Keep it out of the reach of children.

### Goat Ailing.

We have a pure bred Toggenburg goat that came fresh the first of this month and there is still a bloody discharge coming from her. What would you advise doing for her?—Subscriber, San Jose.

Probably a part of the afterbirth was retained which will pass away in time. On account of the size of the animal it cannot be removed. Get one ounce of the tincture of iron and mix it into a pint of water. Give her a tablespoon of this twice a day.

### Looseness of Bowels

There is a great amount of fluid with the passages from our 18 year old horse and it smells bad. Also he bites the hair of his legs. I cured him last year by feeding him pumpkins. We had a veterinarian examine his teeth and he says they are all right. Horse is in good flesh and works well. Am feeding first class oat hay two-thirds and alfalfa hay one-third. No grain. Small or large amount of drinking water makes no difference. What can be done for it?—Subscriber, Downey.

Oat and alfalfa hay cut a little green, even if it is well cured, is apt to cause soft passages from the bowels. Oats and alfalfa should both be allowed to ripen more for horses than for cows. We think the symptoms indicate that you are feeding too much. Try feeding only three or four pounds of mixed hay in the morning, the same amount at noon and not over 12 pounds at night. This may seem a small amount but it is enough for any ordinary horse. Bowel trouble is brought on by bad teeth and overfeeding. There may still be something wrong with the teeth that the veterinarian did not find. Not being able to see the horse we can only suggest cutting down the feed as directed above.

### Kidney Trouble.

During the rainy weather last winter we were forced to keep our horses tied for long periods inside on board floors. One of our best horses began to get thin in spite of good feeding and is still poor. We feed all the hay that can be eaten and liberally of ground barley. He grinds his teeth a great deal and urinates about twice as often as is natural. What do you think is wrong?—Subscriber, Santa Ana.

Another case of overfeeding. It may have caused a stone (phosphatic calculus) to form in the kidney or bladder. First cut down the feed. Do not give over 15 pounds hay in 24 hours. When working do not give over ten pounds ground barley in 24 hours and when not working cut the barley feed down one-half. Give a teaspoon bicarbonate of soda (common baking soda) in the feed twice a day. Get your druggist to prepare 1 ounce iodide of potash in 1 pint of water and give 1 tablespoon of it in the drinking water once a day. If he seems sore when you press on the loins over the kidneys apply a good liniment there once a day. If he does not improve soon please write again and refer to this.

### Skin Disease

Please advise us what is wrong with our little pony. She bites herself as though she had chicken lice on her, but we can not find any and am wondering if she has an itch of some kind. We have washed her several times, and it does not seem to make any difference. When running one's hand over her we can notice a roughness in the skin which is mostly on the fore legs and breast. Can it be blood rash? —Subscriber, Monrovia.

Clip the pony, then wet her all over with a solution of zenoleum or some other good sheep dip, using a teacup of the dip in a bucket of warm water. Repeat this once a week until three or four applications have been used. If the skin still seems rough get these powders: Arsenic 20 grains, powdered nux vomica 1 ounce and powdered gentian 2 ounces. Mix and divide into 20 powders. Give one powder in the feed once a day.

### Congestion of the Udder

Our cow has been giving stringy milk from time to time for about two months. Her right front quarter was considerably enlarged but has gone down to almost normal. A dairyman suggested that we were feeding too much grain. We were feeding half a gallon of beet pulp and half a gallon of A 1 dairy feed at a milking so we have substituted bran in place of the latter. We have been careful to milk her clean at each milking. The udder shows no feverish condition and is not tender. We had her tuberculin tested but there was no reaction. Please advise us what to do.—Subscriber, Anaheim.

The cow is not overfed, but in place of dry feed give her green feed like green corn fodder or fresh cut alfalfa. Mix three pounds epsom salts with two pounds common salt and give a handful of it once a day in the feed. Be sure she gets plenty of good water to drink.

## THE NEW PACKING HOUSE

A group of large cattlemen reported to include Fred H. Bixby, David Babbitt, L. B. Tannehill, Russell Bros. and others, have purchased the H. F. Lewis packing plant at Vernon during the last few days.

This plant is new, modern and efficient, as it has just been rebuilt since the fire of a year ago, and this effort is the first of its kind in the U. S. A. of any considerable volume and importance. The details of operation have not yet been made public, but Ben Crampton, formerly with Cudahy, is reported to be the present manager. We will soon know if there is profit or loss in meat killing. The kill of Los Angeles is at present over a million cattle, sheep, calves and swine yearly, running some 25,000 cattle and calves monthly, 50,000 sheep and 25,000 swine. There are about 80 licensed slaughterers in Los Angeles County now, though the bulk of the kill is done by the six larger firms.

If this group of large cattlemen merely use the new abattoir to slaughter their own cattle and sheep and swine the effort will merely be one more killing plant. If they afford all cattle producers killing or use based upon a charge to cover killing and selling costs of meat it will develop into a first producer effort towards effective cooperation, and if carried out to its logical conclusion later with retail shops to the consumers it would complete an operation that would be of much interest to livestock producers as to results it may achieve. A stockyards market to protect the small men and a slaughter house started by the large men before a stockyards is in operation is confirmatory of the stimulation expected since the stockyards have been announced—A. L. S.

## LABORATORY OF FRUIT AND VEGETABLE CHEMISTRY BROADENS WORK

E. M. Chace, in charge Laboratory of Fruit and Vegetable Chemistry at Los Angeles, writes:

"It has been decided at Washington to broaden the work of this laboratory to include commercial dehydration of fruits and vegetables. In line with this policy, four men, who have been actively engaged in this work for the past three years, will be transferred to Los Angeles, and all work on commercial dehydration in the bureau of chemistry will be carried out at this point.

"It is proposed to install not only a small dehydrator for laboratory experiments, but also one of commercial size for practical tests. The title of the laboratory will remain the same, and the projects on fruit and vegetable by-products, the curing of lemons, the inheritance of composition in citrus fruits, the effect of frost on citrus fruits and the maturity work on avocados will be continued as heretofore.

"This change became effective on the first of July, and will add to the personnel of the laboratory a dehydration engineer and three chemists. These men, together with much new equipment, are enroute."

## JOINT FEDERAL AND STATE CERTIFICATES OF INSPECTION

It has been arranged that certificates of inspection issued at the shipping point on fruits and vegetables will be joint federal and state certificates and prima facie evidence in any court of the United States. It will be perhaps a week or ten days, before final details are worked out. In the meantime, however, it is known that the service will be operated as formerly by the state department of agriculture in cooperation with the United States bureau of markets and crop estimates. Former state inspectors will be licensed as federal inspectors under a plan which will call for the immediate dismissal of any inspector whose work is not found satisfactory by the federal government.

This new plan will, of course, greatly strengthen the legal applicability of the certificates and will thus make the service more attractive to our California shippers.

## PRUNE CROP LATE

The first car of 1922 crop dried apricots was shipped East from the Hanford plant of the California Prune and Apricot Growers Association on Saturday, July 8. The car was sent to Chicago.

First shipment this year is practically ten days later than last, when the first carload of dried apricots of the 1921 crop left this state on June 29.

With the apricot season in all growing districts of the state about two weeks later than normal heavy shipments of the 1922 crop dried apricots will not go forward for several weeks. Even at this late date only small deliveries of dried apricots have been made in the southern San Joaquin valley section and a few light deliveries in Southern California, the two districts from which the fruit is first received.

## POULTRY CULLING DEMONSTRATIONS IN GLENN COUNTY

The several farm centers are appointing committees this month to assist the extension service in conducting county wide poultry culling demonstrations and giving talks the end of this month and the first of next. A definite schedule will be announced later.

# Poultry Queries

Conducted by Jean A. Koethen

### Inflamed Crop

Some of my turkeys have distended crops so filled with water that when I hold them by the feet it pours from mouth, eyes and nostrils. They are on free range.—Subscriber, Holtville.

Your turkeys have inflammation of the crop, which is nearly always caused by indigestible, decayed or poisonous food, more especially decomposed animal food, unslaked lime, paint skins, rat poison, and sometimes by milled feed containing too many hulls. As they are on range I should look there for the cause. Have they by chance gotten hold of gopher poison or something used for spraying fruit trees or a dead animal? Better confine them till you have investigated thoroughly. For treatment, first empty the crop as completely as possible by holding them by the feet, as you have done before, then rinse with several spoons lukewarm water. Follow with a teaspoon of castor oil and keep the birds without food for 12 to 20 hours, after which they may be fed soft, easily digested material, such as rolled oats chopped with onion and alfalfa. Salmon recommends 2 grains subnitrate of bismuth and ½ grain baking soda in a teaspoon water to relieve irritation. Be sure the birds have charcoal and grit both in the food and in a box where they can help themselves.

### Sulphur and Salts

I have seen mention in the Cultivator of sulphur in the mash for hens but do not understand how often it is to be used nor how much. Are Epsom salts good for hens, and has not bran the same effect? Please answer in next issue of Cultivator, for which I am always waiting. I love to read it. —Subscriber, Los Angeles.

Thank you. It is pleasant to know the Cultivator is appreciated by its readers. I think the sulphur prescription to which you refer must be that for chickenpox, which is one pound sulphur to 50 pounds dry mash. The sulphur is mixed in the mash, which is kept before the hens till the 50 pounds is gone. In a small flock a smaller quantity might be mixed in the same proportion, say ¼ pound of sulphur to 12 pounds of mash. I do not vouch for this remedy, but it is recommended by reliable people. Epsom salts in the drinking water occasionally is considered a valuable remedy, particularly in the spring when birds are apt to be bilious from heavy feeding. Half a teaspoon for each bird is the correct amount to use. My only objection to using Epsom salts in this way is that the hens will not drink the water if they can avoid it. It is better to dissolve the salts in water and use it to moisten the mash. Bran is a laxative to some extent, but not sufficient for medicinal purposes. However, do not give salts unless you are sure your hens need medicine.

### Blackhead

I have hatched 600 turkeys this season and now have only 100 left. They are dying at the rate of 10 to 18 a day, and in all I have dissected the liver is enlarged, hard and covered with yellow spots. I have raised turkeys for several years and never had any trouble like this before.—Subscriber, San Diego.

Undoubtedly the trouble is blackhead, as you were told by the feed man you consulted. Some turkey raisers are having fair success with the ipecac treatment recommended by the Drs. Wegeforth of San Diego, but it seems to work better as a preventive than as a cure. To prevent the disease powdered ipecac is mixed in the food, the dose being a teaspoon twice a week for each unit of 20 turkeys. For those already affected you might try fluid extract of ipecac, giving through the mouth 10 drops three times a day for three days, two times a day for three days, and once a day for three days, but a sick turkey is almost always a dead turkey. Another blackhead preventive which has been recommended by a Cultivator subscriber consists of a pint of bran and a pint of bread crumbs moistened with boiling water till it is crumbly. When this is nearly cool add one quart chopped greens, one small chopped onion and a cup of chick grit or sand. For each 10 turkeys add three drops of turpentine and one-quarter teaspoon ginger. This is fed twice a week in place of the regular morning mash and twice a day for three days if white spots are noticed on the backs of the legs. It looks to me as if you had overfed your birds. Some turkey growers keep bran before them all the time after two or three months but I believe the majority give only a mash in the morning when the birds have good alfalfa range. If I were you I would give them nothing but alfalfa and sour milk till they recover.

### Underfed

My four months old pullets are not doing well. At first they become pale and languid, then legs lose color and in advanced stages are quite blue. Some go light and die, others lose the use of their legs. Examination shows only a number of intestinal worms—one recently examined had 12 worms in intestines, others fewer. I have been treating them for worms, at first with turpentine in the drinking water, later with tobacco dust in the mash. Had been feeding laying mash with bran and bone meal added, till two weeks ago, when I changed to growing mash with another medicine in it. Since I began that and the tobacco the pullets have grown worse. I feed wheat and milo, about five pounds per day and two to three quarts of sour milk daily. They have alfalfa in the morning and mash all day.—Subscriber, Escondido.

I believe undernourishment is at the bottom of the trouble. Five pounds of grain per day is a very small grain ration for 100 growing pullets. Professor Jaffa allows from nine to 12 pounds for 100 laying hens, and growing pullets must have more than this. The grain ration should also contain Indian corn for which there is no substitute in raising chicks. Very likely you are not giving sufficient green feed, and two kinds of medicine at once is a pretty stiff dose. Make your grain ration equal parts Indian corn (cracked), wheat and barley, and give the birds all they will eat at night, with a little left over for morning. I do not know how much corn meal there is in the mash you are using, but you would be safe in adding a little. Give sprouted oats in the morning, alfalfa toward noon, and all the sour milk you can give them. It is practically impossible to overfeed growing pullets, for they must have a little extra fat on their bones when they begin to lay or they will not lay long. After they are in condition again and beginning to lay, put them on a regular laying mash but continue to feed cracked corn. I hardly think the few worms you found have done much harm, but you might write Dr. Beach of the poultry division, College of Agriculture, Berkeley, about them. Perhaps you have used more tobacco than he prescribes.

### Feeding Turkeys

I would like some information in regard to feeding turkeys. What and how much should be fed to avoid blackhead?—Subscriber, Burbank.

The important thing about feeding young turkeys is to feed always less than they want, just how much less is what nobody can tell exactly. Write the state experiment station at Kingston, R. I., for bulletin on the feeding of turkeys with reference to blackhead. They maintain that any feed suitable for other young birds, such as rolled oats, johnny cake, chick feed, bread and milk, hard boiled egg, etc., is suitable for turkeys, and that it is always overfeeding that causes blackhead. Some California turkey growers are using the turkey mash

Pumps—Engines—Motors

which is now manufactured expressly for this purpose, but the majority still cling to mixture of rolled oats, wheat flakes or stale bread with hard boiled egg, onion and alfalfa or lettuce. For the nursery feed for a brood of six or seven poults chop a quarter of a hard boiled egg, a pinch of wheat flakes, a bit of stale bread, dried in the oven till it can be mashed to powder, a young onion, top and all, and a small handful of alfalfa quite fine, and add a good sprinkling of grit. Miss Kate Warner of Hemet adds a little cottage cheese to the above ingredients. For the first meal feed about a teaspoon to poults and hen. This amount will be sufficient for the four meals that day and the next, then gradually increase the amount, but never give all the birds want. After three or four weeks the egg may be omitted, rolled oats take the place of the bread and wheat, and dry onions be used in place of the young onions. After the birds are worked onto a ration of rolled oats and chopped onion, with as much green as possible added, a little bran may be added, and the amount increased till by the age of three months they have bran without the oats. Some breeders put them on a ration of bran and rolled barley at two months, but my own experience is that they do better if allowed some rolled oats for another month. After they have learned to eat, say after two or three weeks, poults do much better if given the run of an alfalfa field and fed very little beside. Sour milk may be put before them every day if available. Young turkeys that have alfalfa range and sour milk need little else.

### Literature

Please give me the names of any special turkey or poultry publications published in the state, names of books on turkey and poultry raising and where to get them. I am going into the turkey and livestock business with chickens on the side.—Subscriber, Los Angeles.

You will have your hands full with three specialties to learn at the same time. "Poultry for Profit," which contains more information on turkey raising than any other book published in California, is out of print, but a few copies are still to be had at Germain's, Los Angeles. The department of agriculture at Washington sends out free a very good bulletin on turkeys, and the publications of the R. I. station at Kingston, R. I., are very helpful if they are still to be had. I think there is a small charge for them. You will find Harry R. Lewis' "Productive Poultry Husbandry," published by Lippincott's, Philadelphia, and Professor Dryden's "Poultry Breeding and Management," published by Orange Judd & Co., New York, valuable in your work with chickens.

### Roupy Turkeys

Some of my half grown turkey hens have swellings just forward of the eyes, and it seems to be impairing their vision. At first I thought they were caused by foxtails, but am now satisfied that is not the cause. There is some discharge from the nostril. What is the cause and what shall I do?—Subscriber, Porterville.

The discharge from the nostril shows that there is a roupy condition. You will probably find that there is pus in the swellings, and these should be opened with the sharp point of a pocket knife and the cavities thoroughly cleansed with peroxide of hydrogen, diluted 50-50 with water or with a warm boric acid solution made by dissolving half a teaspoon of boric acid in a cup of water. After cleaning cover the wound with white vaseline or sprinkle on campho-phenique. You may need to cleanse these openings several times. To cleanse the nostril you can either spray or dip the head twice a day in a permanganate of potash solution made by dropping a few crystals in a lard pail or quart measure of warm water. To be of any use as an antiseptic this must be prepared fresh whenever it is used. The following spray is recommended by Dr. Sanborn: witch-hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons. He applies this spray twice a day with a small syringe or atomizer, squeezing the bulb 5 times for each nostril and twice for the mouth. Turkeys that roost out of doors ought never to have roup. If they do it is probably due to an inherited tendency to the disease.

### Grading Eggs

We are beginning to get a great many eggs from our pullets and would like to grade them. What constitutes "fancy," "fresh extras," "pullets" and "peewee" eggs? I want to get a grader if you can tell me where and at what price.—Subscriber, Oxnard.

Scales for weighing eggs may be had at any large supply house, and cost two dollars. Eggs are graded as "pewees" if they weigh 18 ounces; "pullets," 22 ounces; "case count" or "ranch' 'eggs, 22 to 24 ounces; "extras," 24 to 26 ounces. They must also be clean and have firm shells and be of approximately the same shade if they are colored. If you sell through the Poultry Producers' or a commission house they will be candled no matter how fresh they are.

### PETALUMA EGG DAY

Petaluma will celebrate Egg Day this year during the Sonoma County fair, August 19-26. Petaluma calls itself the feathered kingdom, and it seems justly entitled to the name "with millions of chickens, hundreds of millions of eggs, and last year shipped 26,000,000 dozens of eggs, 6,890,000 chickens, hatched twelve million baby chicks."

Besides the Egg Day features there will be a poultry and egg show of big proportions and big interest.

### SOUTHERN CALIFORNIA EGG LAYING CONTEST

With the June production at the Southern California Farm Bureau Egg Laying Contest some of the Leghorns reached the 200 egg mark. Mr. Eisenberg's bird heads the list with 205 eggs. Mr. Roger's bird having passed two other birds during the month, takes second place with 204 eggs. Mr. England's bird No. 357 now has 203 eggs to its credit and Mr. Smallwood's bird No. 218 an even 200. The highest Ancona record to date is held by Mr. Norton's bird No. 485 with 167 eggs and the highest R. I. Red record by Mr. Heying's bird No. 810 with 187 eggs.

The first ribbon for individual production for the month goes to Mr. R. C. Gibson's bird No. 205 with a record of 29 eggs, the second to bird No. 39 belonging to Flinian & Furstenfeld and the third to Mr. Miller's bird No. 27, each of which laid 27 eggs but previous production determines their standing. The entries of Mr. England, Mr. Rogers and Mr. Miller take the first, second and third ribbins respec-

Tomatoes: Demand moderate, movement slow, market slightly weaker. Imperial Valley: Best mostly, 2@3 lb. San Pedro: Lugs, best, 1.50@1.75.

### FRESH FRUIT

These are actual prices obtained July 18 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc., as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apples: Demand and movement moderate, market steady. New: White Astrachans, loose, 4@6½ lb.; packed, 3½@4 tier, 2.75@3.00; 4½ tier, 2.50 per box.

Apricots: Lb., Northern Royal, best, 3@4; poorer, 1@2; local, lug, 75@85.

Blackberries: Fy., 3.50@4.00.

Cantaloupes: Demand slow, movement light, market dull. Imperial Valley: Ordinary quality standards mostly, 1.40@1.50;- poorer, low as 1@1.25. Bakersfield District: Good quality and condition, standards, 1.75@2.00. Locals: Tip Tops, 3@3.50.

Casabas: 2 per lb.

Cherries: Per lb.: Bings, 20@22; Black Republicans and Royal Annes, 16@18; Lambert, mostly 18.

Currants: Cr. 3.00.

Figs: Black, 10@12; White, 8@11.

Loganberries: 2.50@2.75 per cr.

Grapes: Coachella Malaga, 8@10. Thompson Seedless, best around 10.

Peaches: Per lb.: Best, 3@4. Redbirds, fancy, 1.75@2.00 lug; Local Freestone, 6@7. Homegrowns, 75@1.00 per lug.

Plums: Per lb.: Santa Rosas, 2@4. Climax, 2@3 lb; Tragedy prunes, 5@6.

Raspberries: No. 1, 2.75@3.00.

Strawberries: No. 1, 3.00@3.50.

Watermelons: Imperials, Angeleno, 1@1½ lb.; Klondike, 1¾@2.

### CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock July 18 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 4.00@4.50; market pack, 3.00@3.75; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Special brands, fancy, 6.75@7.50; choice, 5.50@5.75.

Oranges: Demand moderate, market steady. Valencias, special brands, 9.00@10.50.

### HONEY

The orange crop is estimated at ⅛ to ⅔ of normal, according to locality. The sage crop is reported generally good, and above average in quality. Perhaps one-half of the crop in the southern part of the state was made by the first of June.

Demand for carlots is reported light, the movement is slow, and the market unsettled. Dealers are said to be buying from beekeepers only on orders. A few carlot sales are reported on usual terms basis as follows: White Orange Blossom, 8½@9, some fancy high as 10. Light Amber Alfalfa, 5½@6 per lb. Beekeepers said to be disposed to hold for higher prices. Beeswax, cash to beekeepers, selling at 22c per lb.

### BEANS

F. o. b. Cal.:

| | |
|---|---|
| Lima, Standard | 9.00@9.15 |
| Lima, Henderson Bush | 9.00@9.15 |

Cal. Lima Bean Growers Assoc. reports some sales made in June for Oct. delivery of 1922 Limas and Baby Limas at around $6.25@6.40 f. o. b. Coast. Demand for futures now quiet. Assoc. has been sold out of 1921 crop for some time.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 18.00@23.00 |
| Barley | 16.00@20.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 16.00@20.00 |
| No. 1 Alfalfa | 15.00@17.00 |
| Standard Alfalfa | 11.00@13.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 20.00 |
| No. 1 Dairy | 15.00 |
| No. 1 Alfalfa | 12.00 |

### GRAIN

Prices L. A. Grain Exchange, July 18.
Barley: 100 ton lots August Del., 121¼.

Grain Department California Farm Bureau Exchange:

Receipts of wheat very light. Brisk export demand through San Francisco. Little California wheat has been exported for several years. Domestic demand good, although many buyers are holding off in anticipation of lower prices. If Chicago market continues at about present level or lower, Idaho and Utah wheat can be shipped and delivered in Los Angeles at about $1.75 f. o. b. California terminals. This crop will be available in August. In the meantime California wheat brings from $1.90 to $2.00 prices on Los Angeles market. Number 1 variety subject to federal grades.

Barley is showing considerable strength in Los Angeles although prices in San Francisco are weaker due to larger stocks available. Principal reason for this strength in the southern part of the state is due to the fact that buyers are feeling the effect of the strike. The Imperial Valley crop is about one-half shipped out. This crop amounted to approximately 20,000 tons this year. The quality is fine but the quantity somewhat less than original estimates. Very little coast barley has been moved. Crop is 30 days late. The San Joaquin harvest is well under way. On the whole California has a big crop of barley and prices are comparatively low. Unless an export demand develops it is not anticipated that prices will be much better. Barley market ranges $1.37½ to $1.32½ f. o. b. Los Angeles according to quality.

# San Francisco Markets

San Francisco, July 18, 1922.

### BUTTER

Sales on Dairy Exchange:

Following quotations carry a jobber-to-jobber discount of 10 per cent, plus a seller's handling charge of 2 per cent of net invoice:

**Peaches, 1922, California Peach and Fig Growers' Assoc. prices :**

Opening quotations for the 1922 dried peach fruit pack announced by the California Peach and Fig Growers, Inc., show an irregular advance over the opening prices of last year in keeping with the general upward movement of California fruit values. The growers anticipate an increase in the export demand and expect that the domestic trade will hoard their early holdings. Following is the list of prices issued by the Peach Growers' Association quoted, f. o. b. Fresno for August and September delivery:

### GRAIN

Prices S. F. Grain Exchange, July 17, f. o. b. S. F. warehouse and storage charges paid.

Barley Feed. 1.15@1.20; shipping, 1.25@1.35.

Wheat Mill, 1.90@1.95; Feed, 1.85@1.90. Milo, 1.90@1.95; No. 2 bulk, 1.90@1.95; Middlings, 41@43.

Oats: 1.40@1.50.

Corn: White Egyptian, nominal; colored milo, 1.90@1.95; No. 2 bulk, 1.80@1.90; No. 2 Eastern yellow, 1.58@1.60.

Grain Department California Farm Bureau Exchange:

Barley: No great quantities on hand. Quoted around $1.20@1.22½ for good feed; heavy head, 1.27½@1.32½, latter price for choiest quality only.

Wheat: Export dealers are out of the market. The mills are maintaining prices: $1.90 for Sonora and soft white varieties; hard white, around $1.95. Should offerings become heavy probably this level will not be maintained.

Oats: Continued good inquiry, though few offered. Feed prices around $1.40@1.55; choice feed around 1.75 S. F. basis.

## Citrus Markets

Los Angeles, July 19, 1922.

Best grade of Valencias continue to receive top prices. All are in eager demand. Only a little over 4,000 cars remain in California for shipment. These will go forward slowly for the next three and a half months and will probably bring big prices. Navel drop is heavy in some districts; in others light. Mutual Orange Distributors estimate the coming crop at 50 per cent normal in the field they cover.

Lemon market is improving somewhat; supplies are being reduced; but absence of hot weather holds down the market.

#### Citrus Shipments

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 19,410 cars; lemons, 7,763; total, 27,173. To same date last season: Oranges, 31,292; lemons, 8,848; total, 40,140. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total, 6,788. From Northern California to date this season: Oranges, 372; lemons, 8; total 380. To same date last season: Oranges, 305; lemons, 5; total 310.

### CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, July 17, 1922.—The Chicago market showed a considerable increase in receipts last week compared with the week previous and an increase of approximately 40 cents a hundred for the week. From available information, it seems that the Chicago market is on a healthy basis and will continue so until the supply of cattle from the Northwest begins going on to that market, which will probably be somewhere near the first of September.

The San Francisco market remains steady, sales being reported in Solano County at 7 cents f. o. b. ranch for eight cars of steers and 5½ cents for cows f. o. b. ranch. Sales in San Benito and Monterey County are reported at 6¾ cents to 7 cents f. o. b. ranch for choice steers and 5 to 5½ f. o. b. ranch for cows.

The Los Angeles market is stronger both for dressed beef and live cattle. Sales are reported at 7½ cents delivered in Los Angeles for steers, and 6 cents delivered in Los Angeles for cows. Sales are reported in Santa Barbara County at 6½ cents to 6¾ cents f. o. b. ranch for steers and 5½ cents f. o. b. ranch for cows, calves 8½ cents f. o. b. ranch.

The supply of fat cattle in the state, if spread over the next 40 days is not sufficient to supply the demand. However, if cattle are forced on to the market too strongly at the present time, it will have a depressing effect on the price, since this is the season of low consumption.

In spite of the comparatively small supply of prime cattle, and due to the high Eastern market compared with prices being paid in California, 35 cars of cattle were shipped from Kern County to the Omaha market on Saturday, July 15. It is expected that additional cattle will be shipped East from this point. This should be a large factor in improving the California prices.

The telephone number of the California Cattlemen's Association office in Los Angeles has been changed to 61064. Use this office.—R|. M. Hagen, Secretary.

### BULK WHEAT THREE CENTS UNDER SACKED

Manager T. E. Morgan of the grain department of the California Farm Bureau Exchange has made arrangements with the largest flour mills to take bulk wheat at 3 cents per hundredweight under sacked wheat, which means that where a farmer pays 10 to 11 cents for sacks he only gets three cents out of them, which is evidence that insofar as the handling of wheat is concerned bulk handling is naturally much preferable. This will permit growers in many sections bulking their wheat at shipping point and retaining the sacks. This, however, may not apply to all varieties of wheat and the management suggest that before a grower starts shipping in bulk he advise of the variety he will have to ship, as all varieties of wheat cannot be used for export milling purposes. There is a certain class of chicken feed trade in the state which we will cater to, and this grain will very largely have to be handled in sacks. Some of the mills are discounting bulk grain 6 to 8 cents per hundredweight over sacked grain.

The Los Angeles office has been doing some very effective work also. It has handled approximately 100 cars of grain shipped out of Imperial County and Imperial members feel that they have saved from $4 to $5 per ton on what they have handled so far this season. Because of their being so completely organized (equal to at least 70 per cent of the county) the exchange has been able to feed the market in an orderly manner, preventing thereby very largely depression.

### UNIFORM GRADES FOR ARIZONA COTTON

(Continued from Page 77)

knows? A few pounds extra lint even at a low price will pay for a number of hours of extra labor at American prices.

#### Land Costs High

Because of the high price of land in Egypt, which makes rent or interest high, and the slow methods of plowing, planting and cultivating, the cost of raising an acre of cotton in Egypt comes nearer to the cost of raising an acre in America than one would suppose when the very wide margin between the prices paid for labor in America and in Egypt are the only consideration. When the costs of harvesting are considered the Egyptians have it over us with a difference that is discouraging. Picking Egyptian cotton, whether it be the Sakellaredis grown in the Nile Valley or the Pima grown in Arizona or California, is a slow and tedious job as compared with picking the short staple cotton of the Southern states.

#### Spinners Buy in Egypt

When we who scan the reports of the world's cotton markets and read that America buys more cotton from Egypt and pays a better price for it than from Arizona, even when there are warehouses and gin yards loaded with cotton we ask, "Why?" We learn that the spinners of long staple cotton are not philanthropists and neither are they so excessively patriotic as to sacrifice profits for the sake of using cotton grown in America just because it is a home grown product. Yet in spinning tests and every other test that is known, our No. 1 Pima cotton equals or excels the best of the Egyptian cotton. Then what is the trouble? The spinners say it is due solely to the uneven grades of cotton found in any single bale. A bale of cotton may be classed as No. 1 or No. 2, and the classer has been unquestionably honest, but the sample which he had may not be representative of more than 50 or 75 per cent of the bale simply because the quality of the cotton in the part of the field where the pickers worked varied, and all the cotton was picked together, and the sample from any bale is only representative of the major part of it. "It ought not to make much difference," so we think, but to the spinner, it does make a difference, and since he can obtain from Egypt bales of cotton that are even all the way through he prefers that from overseas.

#### Bales Must Be Uniform

It is not conceivable that Yankee ingenuity is to be baffled by the one last step after all the trials and achievements of perfecting the best cotton in the world. Some way must be found for making the cotton uniform all through the bale. It is not to be supposed for a moment that after taking the seed from Egypt and spending 20 years in the development of a type of plant that is ideal, and after developing the most thorough system of cotton seed breeding in practice in the world today that the one thing lacking will stop the cotton growers.

#### Working Out the Problem

Just what plan will be finally adopted as most practical is not yet known. For this present season an acreage is to be selected that will furnish from 1,000 to 5,000 bales, depending upon matters that have to be gradually worked out between now and picking time. Observations are being made over a considerable acreage at the present time, and when the cotton is ready for picking it is planned to have experts go over the fields and indicate the quality of cotton in different parts of the field. There are a number of factors that operate to affect the quality of the cotton. A portion of the field may have been in alfalfa for the previous season, while a part may have been in some other crop. There may be spots that have been fertilized. There may be some areas that have a different type of soil which takes more or less water than the major portions of the field. A place may be high and receive too little water. A ditch may have broken and a portion of the field may have had too much water. All in all there are many things that may happen to make a difference in the staple length and quality. The problem is to keep the grades by themselves. If this plan works out satisfactorily the work will be extended to larger areas next year. If this is not the best way then some other will have to be found. Whatever it is, there is a certainty that there must be more care used in the picking of the cotton.

Pima cotton is an expensive crop to grow. When grown and the grades are kept uniform and the cotton is clean and free from leaves or other trash it is the best and strongest cotton known. Its uses are many and some new use is being discovered every season. The last step in the final perfection of this cotton from the spinners standpoint is now being worked out. Pima cotton in spite of discouragements is still the premier cotton of the world.

### SOUTHERN CALIFORNIA EGG LAYING CONTEST

(Continued from Page 93)

tively for pen production for the month.

The egg production for the contest flock was only about four per cent under that for May but a sudden decrease in mash consumption during the last few days of the month and the dropping of a few feathers by some of the birds predict a coming slump in production. The birds consumed on an average 3.37 pounds of grain, 2.97 pounds of mash, and 2.5 pounds of green feed and gave a 66.77 per cent egg production.

### RED SPIDER INCREASING RAPIDLY

The red spider, which is one of the most destructive pests to certain orchard trees in mid-summer, is now becoming very abundant, says Theo. D. Urbahns, field entomologist of the California department of agriculture. The hot weather is very favorable to the development of this pest. The infested leaves curl up, dry and are carried with the wind, spreading the little mites from one tree to another until they become scattered over the entire orchard. The red spider multiplies very rapidly when trees once become infested.

The best control consists of spraying early and very thoroughly with wettable sulphur or by repeatedly dusting with dry sulphur. Many of the growers are spraying with lime-sulphur and with diluted solutions of commercial miscible oils. Both will kill the red spider where the spraying is thoroughly done, so that the spray actually comes in contact with these mites. There is, however, considerable danger of burning the leaves when these solutions are used in very hot weather. In case of extreme infestations, a spray consisting of one and one-half gallons of lime-sulphur and five or six pounds of wettable sulphur to each one hundred gallons of water thoroughly applied with plenty of pressure and material to each tree makes a very effective spray for this pest.

### GUERNSEY SALE AT RIVERSIDE

Relative to the registered Guernsey cattle that are to be sold at Riverside on August 4, we have just received the following from Manager C. R. Thomas: "The Guernsey cattle that I am to sell at Riverside for L. D. Smith are a mighty useful lot. Of the 36 cows and heifers offered about 25 are in milk, most of the others are bred and several of them are heavy in calf. Many of the cows are heavy milkers, having made as high as two and a half pounds of fat per day, and if given an opportunity in the future will, no doubt, make a most creditable record. Of the bulls, two are now old enough for hard service and these are splendid fellows. The other two are yet too young for service. Six heifers too young to be bred are included in the offering. These cattle are in good condition, are splendidly bred, are tuberculin tested and are the kind that the breeders and dairymen need, and they come from a clean herd." Catalogs are now ready and can be had by writing to Mr. Thomas at 808 Santa Fe Building, San Francisco.

A recent massmeeting of cantaloupe growers and shippers at Brawley passed resolutions highly commending Horticultural Commissioner Waite of Imperial and his deputies for their work in preventing shipments of green cantaloupes.

# Capacity Counts!

BECAUSE, through our tremendous milling capacity, we can control the source of most of the ingredients used in our feeds. For example: the bran, shorts, middlings and flour that go into SURELAY are by-products of our own mills. Then there's corn. We use 10% or more in this feed—and here are our mills in the *center* of the largest corn-growing district in the State.

Animal protein offers another example: the amount of *meat* we use daily puts us in position to secure meats of uniform, high quality throughout the year. In one case, we use the *entire* output of a single manufacturer. Again, there are vegetable proteins. Direct purchases in tremendous quantities of soya bean meal, cocoanut meal and linseed meal offer another price-advantage.

So there you are! You can't dodge this fact: large batches of feed can be manufactured cheaper than smaller ones. Capacity counts! We have the facilities, the equipment, the experience. Our costs per ton of feed *are* lower. No two ways about it!

Then, for extra good measure, there are the daily laboratory tests—a feature no individual poultryman could possibly afford. Before being used, each ingredient destined to go into SURELAY is analyzed in the laboratory for quality and feed value. All grains are recleaned before being ground or cracked. Never will you find mill waste, dust, smut or sweepings in Sperry Feeds. During the actual process of mixing, samples are taken regularly and tested for uniformity. It is test, test, test all the way for SURELAY—and every other Sperry Feed.

And all to what purpose? To make sure that SURELAY will live up to its reputation as the most uniform, most dependable egg mash on the market. To make sure that "what's on the tag is in the bag"—always!

Always specify SURELAY-in-the-yellow-striped-sack from your dealer; and send for the new edition of our handbook, "Makes Hens Happy." It will show you how Sperry capacity counts in bringing feed-costs down. Mail the coupon now!

# Fence Rails a Hundred Years Old

The Cultivator camera has strayed away and is capturing the worm fences with wild raspberries and mandrakes and real elderberries in the corners. The "youngest" of the rails shown in this photograph are around 75 years; more of them are around a hundred and a hundred and a quarter.

Some of the rails are of oak, some of maple, more of walnut, beautifully grained walnut. Some are showing the ravages of time, and all have rendered effective service for an average of more than a century.

This scene is on the Townsend Farms, a great property of several thousand acres on the Western Reserve. The implements and the furniture of pioneer days are all preserved on these farms, though modern methods prevail in production.

There will probably never be more rail splitters, and another generation will know of a rail fence only because of the Cultivator, or other cameras, which have perpetuated them. The tree which lends itself so delightfully to artistic use is the Slippery Elm.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

### FILLED MILK LAW UPHELD

In a suit brought to test the validity of Wisconsin's "Filled Milk" law, the state supreme court held that the legislature is given the power to prohibit the sale of "filled milk" or other food products believed to be deleterious to the welfare and health of citizens of the state. This will be welcome news to the dairy interests of the United States, as it is in line with the efforts they have put forth to discourage the use of substitutes for any of the dairy products. We trust that with each victory won, they will renew their efforts to keep their products pure, clean and healthful so that the consuming public will learn to use only the pure unadulterated dairy products.

### FUMIGATION

This week's paper contains an article on "Fumigation Recommendations," by R. S. Woglum, entomologist for the California Fruit Growers Exchange.

Mr. Woglum has made a close study of fumigation methods in California, having been sent here by the department of agriculture a number of years ago to investigate the unsatisfactory results of fumigation prevailing at that time, and it is largely due to his efforts that the scheduling methods now employed were worked out.

We believe that every citrus orchardist should carefully study his "Fundamentals of Successful Fumigation" and then see that the men fumigating his grove use the proper care in their work.

Much of the unsatisfactory work being done of late years, we believe, is due to carelessness of employes in one way or another, and by familiarizing themselves with these "Fundamentals" growers will be in position to determine whether or not their work is being properly done.

### LIMA ASSOCIATION

The annual report of R. L. Churchill, manager of the California Lima Bean Growers Association, appearing in this issue of the Cultivator, should be of interest, not only to all bean growers, but to all friends of cooperative marketing.

Because of a lack of space we are unable to publish the report in full but have tried to give the essential points, leaving out only such portions as, we felt, were not of general interest to our readers.

The California Lima Bean Growers Association is a comparatively young organization, but its methods of handling and marketing crop and the reputation it has established with the trade for fair dealing, have enabled it to build up a demand for the product of the growers, that otherwise could not have been accomplished.

All of which goes to show that cooperation tends to better market conditions by better and more uniform grading of the crop, thus making it more dependable to the dealer and attractive to the consumer and creating a greater demand which invariably brings the producer better returns at no material advance to the consumer. We sincerely trust that Mr. Churchill's appeal for more members will meet with a hearty response from all Lima bean growers. The old adage "In numbers there is strength" most certainly applies in all cooperative movements.

### QUALITY—THAT'S ALL

Shall the farmers continue to cooperate in marketing or shall enactments which permit cooperation be considered class legislation?

Writing to Senator Capper Bernard M. Baruch refers to an address in which one Judge Gary severely criticized "special privilege cooperation." He (Mr. Baruch) said:

"I gather that Judge Gary is of the opinion that the legislation authorizing farmers to cooperate in marketing their products confers privileges upon them that are denied to other producers, and thus results in inequality of citizens before the law, and in fact.

"It is admitted by all that there should be that equal opportunity for the treatment of all pursuits which he contends for, and that is precisely why I have done what I could to assist the farmers in procuring legislation authorizing them to cooperate in marketing their products, for that is but restoring balance to the economic whole. The legalization of agricultural cooperation does no more than attempt to put the six millions of scattered and competitively selling farmers on an equal footing with the largely consolidated buyers of their products and with industry generally.

"The farmers have not asked for any special privilege, nor has it been accorded to them. Certain laws have been passed, and others sought, to enable them to do in their way—cooperation—what other producers, the makers of steel, for example, do by means of great corporations. The purposes of cooperation on the other hand and corporation on the other are the same—economy, efficiency and a degree of certainty of adequate returns for capital and enterprise. It simply happens that the farmers can cooperate, but can not make use of the corporation form of organization. Both sorts of organization are properly subject to governmental regulation for the protection of the public. Where is the inequality in this? Rather is it not the attainment of equality?"

### A FIELD

The Chicago grain pit is the greatest grain market in the world.

Its greatness is indicated by the fact that last year the transactions in the wheat pit of the board were greater (possibly a dozen times greater, I've forgotten now) than all the wheat produced in all the world. So it may be imagined there is some swiftness of action. Anyhow the "Exchange" is a mighty interesting place to go.

The racket made in the efforrt to buy or sell 5000 bushels of wheat is prodigious. It resounds until it reaches through doors and walls to the street. The racket leads one automatically up the steps and two broad stairways into the visitors gallery from which we could look down into the "pits." There was one for "selling" wheat, another for corn, another for oats, one for rye and barley and one for provisions. In this Exchange principally grain is handled.

The vast number of small tables at extreme left of the great room contained small packages or paper bags with samples of the grain to be sold.

The pits, except that of wheat, were nearly deserted, indicating, I was told, that the day's business in those lines was practically completed.

#### An Instructor

Then I spied an onlooker nearby who had a look in his eye as if he had a slight conception at least of the proceedings, so I asked as to what the rumpus was all about. From the position taken by his eyebrows I perceived that he considered that not a very intelligent question. However it served as an entering wedge and I found a world of information regarding Board of Trade operations. My informant had "been about this Exchange, almost daily, for over 40 years."

When a new outbreak occurred and almost the whole pit seemed to be pointing the finger or clenched fist at one man I asked as to its occasion and as to what he had done. I was told that he had come into the pit with a vast quantity of July wheat to sell. He had sold a few lots of 5,000 bushels each at $1.12¼ and now had just offered 25,000 bushels at $1.12⅛. The instant increase in the yelling and gestures was almost terrorizing. In the pushing and jostling which resulted from the effort to get their signals recognized, it appeared like a free for all fight. Many were coatless, and one broker's shirt sleeve was torn nearly off at the shoulder.

I asked my instructor as to these signals and he gave me this:

"The sign language is simple and consists of eight motions covering fractional changes in price, and a ready code, denoting the amount of bushels bought or sold.

"Prices are denoted by the hand held horizontally. Held vertically the hand signals the quantity desired or offered. The hand signaling price or quantity held with the palm out or away from the trader, shows a desire to sell, with the palm toward the trader it denotes a wish to buy.

"The horizontal clenched fist denotes an even price, say $1.80 a bushel. One finger extended, ⅛ of a cent; two fingers spread apart, ¼ of a cent; three fingers spread apart, ⅜ of a cent; four fingers spread apart, ½ a cent; four fingers and the thumb extended and spread apart, ⅝ of a cent; four fingers and the thumb extended but pressed together, ¾ of a cent; hand clenched with the thumb alone extended, ⅞ of a cent.

"Indicating the quantity the fingers are displayed vertically, each representing 5,000 bushels. The whole hand, fingers and thumb extended vertically represents 25,000 bushels.

"A single transaction is after this fashion: A broker wants to buy 5,000 bushels of December grain at $1.24⅞ a bushel, the last sale having been $1.25 a bushel. He extends his hand, fist closed, thumb extended, palm toward himself, and shouts his offer. His words may be lost in the volume of sound but his signal is seen by a broker across the pit who is willing to sell at that figure, and the signal is answered. The buyer raises one finger vertically, indicating that 5,000 bushels are wanted and a nod accepts the offer. The transaction is complete. The buyer notes on the blue side of his trading card '5 Johnson $1.24⅞,' the blue side denoting a purchase, while the seller notes on the red side of his trading card. red denoting a sale '5 Smith $1.24⅞.'"

But why this confusion and contention? "If a miller wishes a hundred thousand bushels of wheat why does he not go on the market and buy it and have it done with?" "Yes, my dear sir, that's exactly what he has done, only in the vastly more expeditious way through this exchange. He instructed his broker to buy, the broker made two or three gestures and the transactions were completed."

Maybe! But some way I came away from the Chicago Board of Trade with a thorough conviction that the whole gambling operation is a menace to the country's best interests. Who pays for the bread and butter and torn shirts and big fortunes, and fine homes in which these operators live? Who pays for the hundreds of telegraph boys and attendants and the thousand and one other "expenses?" And who suffers because of the vicious practices of bulling or bearing the market?

Well it isn't the "bull" and again it isn't the "bear." None of them have ever thought for a moment that the farmer has any right to figure the cost of his production and expect—and receive—a fair profit.

An old adage has it "If little labor, little are our gains; man's fortunes are according to his pains," but when the wheat pit is in operation there is no consideration whatever as to labor or pains required in production. A big bear on the market with a few millions of bushels under his direction can depress and greatly injure and possibly ruin millions of farmers.

Who pays the costs of the "Exchange" and the millions in fortunes made on it?

The farmer.

---

Forbes Magazine suggests: "Difficulties make men. Ease makes mollycoddles. It is harder to climb than to stroll along a level road or dawdle down hill. Difficulties are stepping-stones leading to the top. Therefore, do not dodge them, do not run away from them". This is intended as advice for the clerk or the young man starting in business. We do not see but that it applies with equal force to the young man—and to some of us who are older—who are making a living from the soil.

# Suggestions for Drying Figs

By I. J. Condit, Horticulturist,
California Peach and Fig Growers

NO ARBITRARY methods can be used or directions given for the best drying of figs. Varieties differ as to their requirements and texture. While fig sections vary in temperature and humidity, a method which may be successful in Tulare and Fresno Counties may not give good results in the Sacramento Valley. The difference in treatment is largely a difference in time required to secure the same results. This length of drying depends mainly upon the atmosperic humidity. Growers, therefore, must use their own judgment as to the length of time the figs are left in the sun or in the stack.

Quality in figs begins in the orchard, in the care and cultivation of the trees, as well as in the handling of the crop. The following suggestions are therefore offered in the hope that they will help to produce a product of more uniform and better quality:

### Picking Up or Gathering

Before harvesting time the surface of the ground should be smoothed or dragged to make it easier to pick up the fallen figs and produce a cleaner product. Weeds and grass should be hoed away from the trees, but under no conditions should the dried grass be burned, as is sometimes done. The dried fig when it reaches a certain stage of maturity drops naturally to the ground. The trees may be lightly shaken, but care should be taken not to dislodge immature or green fruit. Under no conditions should the trees be clubbed or the fruit knocked off with poles. Green fruit dries out into a very inferior product due mainly to lack of sugar. The ideal system is to gather the fruit from the ground every day, as the longer the figs are left on the ground, the longer they are exposed to sunburn, to dust and dirt, and to infestation of worms. The figs are ordinarily picked up into lug boxes holding from 40 to 50 pounds, this work being mostly piece work. The boxes are hauled direct to the dry yard when almost full. The treatment in the dry yard differs with the variety.

### Trays and Boxes

There is considerable variation in the size of the trays used. A common size of tray is 46½ by 36½ inches. Larger trays to be handled by two men are 8 feet long and 3 feet wide. In the raisin districts ordinary raisin trays are commonly used for figs. In any case the trays should be under cleated or properly constructed so that when stacked there may be a free circulation of air between. The trays should not be overloaded, that is, too many figs put on one tray, as this prevents rapid drying and makes it more difficult to sort the figs properly.

### The Mission Fig

The success of recent shipments of first crop Mission figs to the Eastern markets has demonstrated that the best returns can be secured from marketing this crop in its fresh state. The first crop of Mission figs is inferior dried and by no means should it be mixed with the main crop. The figs of the main crop drop naturally to the ground, after which they should be picked up as frequently as possible. In unfavorable weather such as high humidity, or after a slight shower, Mission figs mould very quickly if left on the ground. Frequent gathering and spreading on the trays will help to produce a better and more uniform product. In Tulare, Fresno and Merced Counties Mission figs should be left in the sun not longer than two or three days if there is good drying weather. In the more northern sections the fruit may have to be left in the sun somewhat longer. After the exposure to the sun the trays are stacked and the figs allowed to dry slowly until they are ready to be boxed and delivered. Care must be exercised in thoroughly curing Mission figs as insufficient curing results in moldy fruit.

### Calimyrna Figs

As with the Mission, the Calimyrna fig should be picked up frequently. There seems to be no question that sunburn of the fruit occurs mostly on trees which have sparse foliage. Overexposure to the sun on the ground or on the trees, however, tends to produce a tough or woody fruit. The Calimyrna figs should therefore be cured principally in stacks. In some districts the trays may be stacked almost immediately after picking up the figs from the ground. In more humid sections exposure to the sun may be necessary for several days.

The Calimyrna figs do not require sulphuring and should not be sulphured, except under unusual climatic conditions to prevent fermentation.

### White Adriatic

Frequent picking up of the Adriatic fig is to be emphasized, as with the other varieties. Neglect will result in sunburn and in dark color, as well as greater infestation of beetles, fruit flies, and worms. Immediately after the gathering of Adriatic figs into lug boxes they are dumped on the drying trays and sulphured late in the day or during the night.

### Sulphuring

All varieties of figs are not sulphured. The Mission fig, being black, could not be improved in color by any amount of sulphuring. The Calimyrna fig when properly handled is of such a light color naturally that it does not need sulphuring, but the Adriatic is ordinarily subjected to the fumes of sulphur for the purpose of lightening the color, softening the skin and disinfecting the fruit from the germs of decay which may be present and from any insects which might have crawled into the figs through the eye.

The pure food law, enacted by congress in 1906, established an arbitrary limit to the percentage of sulphur compounds in evaporated fruits. California dried fruit growers consider this limit too low. As a result of their protest the enforcement of the law

# California Lima Bean Growers Association

Report for 1921 by R. L. Churchill, Manager

THIS association's legal year marks the close of its sixth season, and we have this week completed the sale of the last of our 1921 crop of Limas and Baby Limas, thus ending the marketing of the sixth successive crop of the grower members.

Organized in the midst of the great world war, the association's life history has been strenuous, because of passing experiences peculiar to the bean business, and including the unfortunate results upon quantity and quality production caused by the drouth of the 1920-1921 crop years.

### Marketing the 1921 Crop

The total 1921 crop of regular Limas amounted to only about 700,000 one hundred pound bags, or but a trifle more than half a normal production, and a total of about 150,000 bags of Baby Limas. Of these totals, something over 60 per cent of the Baby Limas and between 40 and 45 per cent of the regular Limas were produced by association members.

After cleaning losses and seed reservations had been deducted there remained about 247,800 bags of regular Limas, and 79,100 bags of Baby Limas for association sale and shipment.

The average f. o. b. car returns from the sale of these beans will show approximately $6.47 per hundredweight for regular Limas and $5.67 per hundredweight for Baby Limas.

With the exception of a few cars that were sold prior to the harvest last fall our selling prices ranged from the first month's steady market $5.65 to $5.85 on Limas and $4.85 to $4.95 on Baby Limas up to as high at $9.00 to $9.25 for a limited quantity of both varieties during a combination period of relative scarcity and dealer manipulation this spring.

The association's expense and cost of marketing, including storage, insurance, interest and advertising, have been very low this season, being about 37 cents per hundredweight or 9 cents per hundredweight less than the 1920 crop cost on Limas and 14 cents less on Baby Limas, despite the smaller volume of beans handled. This is principally accounted for by lower insurance, interest and tax charges and reduction almost to the vanishing point of our advertising appropriation, although some other savings were also effected.

### Distribution

Considering the small crop and the effect of shipment of large quantities of 1920 crop Limas and Baby Limas, by independent shippers late last summer, we secured a good general distribution this season, shipments being made to more than 100 different markets.

### Grade and Quality

In view of the considerably below normal quality of the general run of Limas, due to lack of sufficient moisture to cause proper maturity, and the stain damage resulting from too much moisture at harvest time, it required extra care and watchfulness to maintain a grade which was none too good, and at the same time protect our members as much as possible from excessive cleaning and hand picking costs, especially under a system where we have no control over warehouses other than requirement that beans must be brought to grade. Mr. Davis, in charge of our inspection and field department, had two assistant inspectors during a portion of the season, but personally attended to a considerable part of the inspection work in Ventura County. Under these conditions it must be granted that our receiving very few complaints upon quality and having only one allowance to make on arbitration is an excellent record.

The effort which the association has been making toward improving in a reasonable and practicable manner the grade and quality of Lima and Baby Lima beans is one of its most helpful and constructive lines of work from an industry standpoint. Some noted authorities upon economics go so far as to assert that the essential benefit which is possible to be derived from cooperative marketing of farm products is to be found in the improvement of the product, and that this exceeds in value the savings to be made through securing the profits which usually go to private marketing agencies.

The individual farmer cannot secure the information that will enable him to analyze the market for his product and intelligently decide as to the quality and quantity which consumers demand. This is a service which the cooperative marketing association is best fitted to render satisfactorily because it can secure the necessary information and will strive to use this for the best interest of its members. If the right quality of goods can be delivered to the right market, in the right quantity at the right time, successful marketing is accomplished. We have taken some good steps in this

# Agricultural News Notes of the Pacific Coast

## Northern California

Dogs and cats will not be allowed within the Yosemite National Park except on leash.

Contract has been let for construction of state highway from Auburn to Colfax in Placer County.

The state has purchased 180 acres of timber in Humboldt County to add to the state Redwood Park.

Shasta County has two traffic officers patrolling the state highway between Cottonwood and the Siskiyou County line.

It is estimated that plantings of rice in the Sacrameno Valley this season will total between 140,000 and 150,000 acres.

The cooperative grain elevator at Lincoln, Placer County, has been finished and grain has begun to come in for storage.

Seed sowing machines are being used to spread poison in sections of Sutter County threatened by invasions of grasshoppers.

Manager Hyrup of the Colusa County fair says that many requests are coming in for exhibition space. The fair will be held September 13-17.

Dodgeland, Butte County, reports barley harvesting well along and yields are good; wheat will be finished in a few days; rice prospects excellent.

Chico is making great plans for "Hands Across the River" conference on August 2, when eight counties of the Sacramento Valley will be represented.

The management of the Colusa County fair announces that many outside exhibitors are already signing up for space. Fair will be held September 13-17.

Sales were made last week by the California Rice Growers Association of 127,000 sacks. The prices ranged from $2.87 to $3.27. This practically cleans up the crop.

Glenn County farm bureau has asked the supervisors to redistrict judicial townships, eliminating five, retaining only Willows, Orland and Butte City. This as a matter of economy.

The first car of 1922 dried apricots was shipped east from the Hanford plant of the California Prune and Apricot Growers Association on Saturday, July 8. The car went to Chicago.

One hundred and thirty-seven of the almond growers in the vicinity of Arbuckle and College City, Colusa County, have signed contracts with the California Almond Growers Exchange.

From Sonoma County early apples are moving to market in small quanities rapidly. Picking of Gravensteins commenced July 20; tomatoes healthy and truck generally developing fast; hops doing very well.

Competition has been keen among rice buyers for the last of the 1921 crop, Japanese buyers being particularly anxious. Some members of the associaion assert that the last bags of 1921 rice will go at $4.

A typical section of the Redwood Highway along the coast counties from San Francisco to Eureka and Crescent City will be one of the features displayed at the state fair by the North of the Bay Counties Association.

## Central California

The three creameries in Tulare sent out pay checks in June totaling nearly $200,600.

Report of the Stanislaus County Cow Testing Association for June shows 1255 cows tested.

Twenty-seven peach growers have signed up in the Modesto County farm bureau peach growing contest.

The Turlock cannery expects to start on Elberta peaches August 25 and make the heaviest run in its history.

There is no carry over from California's last year's dried peach crop. Estimated production this year is 23,000 tons.

Considerable damage from army worms is reported from Stanislaus County by Horticultural Commissioner Rutherford.

The newly formed California Olive Growers Association reports 30 per cent of the growers of the state have signed up their crops.

Many entries have been made by poultry raisers in the poultry department of the Tulare fair which will be held at Visalia September 12-19.

Manager T. E. Morgan of the grain department of the California Farm Bureau Exchange announces that the grain pool will be closed August 1.

Modesto fruit shippers say that practically all of the leading Eastern markets can yet be reached by railroad lines not tied up by the strike.

Apple growers of Owens Valley have formed a marketing association. The association expects to make a marketing charge of 10 cents per 40 pound box.

Four carloads of Black Mission figs were shipped from Merced last week to Eastern markets. The fruit was packed in 8 pound boxes, 2250 boxes to the car.

The first carload of fresh grapes to leave the San Joaquin Valley was loaded at Magunden, Kern County, and was grown in the Arvin and Weed Patch districts.

The California Sweet Potato Corporation at Turlock will this season manufacture alcohol from undersized sweet potatoes and other waste fruit and vegetables.

Shipment of lemons infested with red scale was condemned at Porterville and destroyed. The lemons were said to have come from the southern part of the state.

Turlock melon growers on July 19 were compelled to haul 15 carloads of melons back to their ranches because there was no possibility of securing cars to ship them out.

W. C. Jacobsen, head of pest control of the state department of agriculture, has been in Stanislaus County making a weed survey to determinate weed free areas.

The Tulare County Poultry Association is paying members 24 cents for number 1 June eggs. The association marketed during the month $7,000 worth of eggs and $5,000 of poultry.

The first annual sales convention of the Sun-Maid Raisin Growers was held at Fresno, July 19-25. 28 district managers from all parts of the United States and Canada attended the meeting.

## Southern California

The first cotton textile factory at Los Angeles is nearly completed.

Banning dry yards are handling a large tonnage of apricots from Hemet.

An almond packing house is being built at Paso Robles, San Luis Obispo County.

A new vinegar plant is being built at Redlands. It handles cull apples from the Yucaipa Valley.

Horticultural Inspector Hadley estimates that 5,000 acres will be fumigated this season in the Redlands district.

President Larzalere of the Escondido Grape Day Association is organizing his committees to arrange for celebration on September 9.

Nearly 600 industrial establishments have already taken space in the Pageant of Progress exhibit to be held at Los Angeles, August 26-September 9.

A. D. Shamel of Riverside has returned from a six months stay in Honolulu where he was engaged in work on improving strains of sugar cane.

Secretary Van Pelt of the Southern California fair, to be held at Riverside, October 10-16, reports several entries made by breeders of pure bred sheep.

San Diego County is much interested in progress of the big Warner dam project which it is said will provide irrigation for 50,000 additional acres of orchard land.

In Imperial County a good crop of grapes ripening nicely; Honey Dew melons still moving; watermelons good in amount and quality; alfalfa is doing well; cotton excellent.

W. S. Anderson of West Riverside has been elected president and Will S. Mays of Riverside, secretary, of the newly organized Southern California-Poland-China Breeders Association.

Growers of Redbird cling and Early Rose peaches are advertising themselves, and Yucaipa Valley by enclosing in each box of peaches a slip giving name of owner, orchard and place where grown.

Plans are being made for the construction of an evaporating plant at Banning to cost $40,000. This will take care of a large portion of the apple crop which heretofore has not been marketable as fresh fruit.

Poland China breeders of Riverside, San Bernardino, Orange, Los Angeles, Imperial, San Diego and Ventura Counties have organized a breed association which will affiliate with the Southern California Livestock Association.

A series of irrigation field meetings has just been concluded in Riverside County. They were held under direction of W. R. Schoonover. Especial attention was given to methods of securing uniform distribution of waters through citrus groves.

The newly organized Deciduous Fruit Distributors of Southern California has signed articles of incorporation. The new organization will market for the Yucaipa Apple Growers Association, The Independent Fruit Growers and unorganized growers in Yucaipa and Oak Glenn. The association starts with 2,000 acres of apples and pears signed up.

## The Coast and General

Algeria exports great quantities of flower and vegetable seeds.

Spain uses large quantities of honey in making nut and other candies.

Arizona state fair will be held at Phoenix, October 30-November 4.

The sugar beet crop in Eastern Idaho is said to be the best in many years.

The Phoenix chamber of commerce is encouraging "Trade at Home" and "See Arizona First."

Cuba is sending heavy shipments of honey to Antwerp at an f. o. b. price of four cents per pound.

Maricopa County, Arizona, announces that contractors are finishing one mile of highway a day.

Argentine's potato crop is becoming so large that growers are looking into development of export business.

A carload containing 500 hives of bees was shipped from Salt River Valley of Arizona to pasture in Colorado.

The United States forest service is using airplanes to discover and photograph lakes in the national forests of Alaska.

Italy's filbert crop is reported of unusually fine quality. The United States last year imported 700 pounds of these nuts.

The Oregon Growers Cooperative Association expects to handle between 20 and 30 million pounds of prunes this year.

Sicily's annual production of lemons is about 8,000,000 boxes. Approximately about 20 per cent is sent to the United States.

The experiment station at Sacaton, Arizona, distributed this spring 1200 tamarisk cuttings which are reported to be making splendid growth.

Total savings deposits in the banks of the United States amount to $16,500,000,000. Of this amount $1,453,927,000 is in the Pacific states.

Heavy shipments of wool are being made from Custer County, Idaho. Prices are said to be 100 per cent better than last year at this time.

Mexico has resumed shipment of beans and the department of commerce states that American buyers are making heavy purchases of beans in Roumania.

In effort to control fever tick 6,000,000 cattle were dipped in Texas during May. More than 250,000 herds are under active process of being freed from ticks.

The Arizona Cattle Growers Association at its recent meeting in Prescott selected H. M. Rice of McArthur, California, as secretary. He assumed his duties on July 20.

American Consul Stiles at Patras, Greece, is insisting that Greek currant packers who wish to export to the United States comply with the sanitary regulations of the U. S. department of agriculture followed by the California raisin packers.

Alfalfa growers of Western Nevada met at Fernley July 16 and organized an association to market their 1922 crop. They have a large crop and the California quarantine against alfalfa weevil is making it a problem where they will dispose of their hay.

# Frost Protection on Rancho Sespe

## By Manager Howard F. Pressey Before Citrus Institute at Pomona

THROUGH the several years of frost protection by oil heating we have proven to our own satisfaction, under conditions as they exist with us, and we feel that they are not so very much different from conditions in other communities, that frost protection is a paying investment and good insurance, and that trees and fruit can be saved by efficient and effective firing.

### The 1913 Freeze

In 1913 the Rancho Sespe had a severe and striking lesson on the value of orchard heating. The thermometer recorded as low as 16 degrees. On 150 acres, protected with only a two gallon laid pail type heater to a tree, we were able not only to save the trees but also a portion of the fruit. On 150 acres not protected the trees were killed to the ground. It is well known that it is rather impossible to get much fire from a two gallon heater when one has to fire as early as 6 o'clock in the evening and maintain fires throughout the night. Yet it is rather interesting to know, without endeavoring to explain, that in comparable groves, one protected with a two gallon heater to a tree and one not protected, both groves registering the same temperature of 21 degrees, that a portion of the fruit was saved on the protected section, while the unprotected section was frozen to the ground. This season of 1913 fully demonstrated the efficacy and necessity of orchard heating, for even though we were equipped with only small unimproved orchard heaters, we were able to save trees and some fruit.

The season following the big freeze found us fully equipped with 13,500 seven gallon Dunn orchard heaters in addition to the 12,000 two gallon heaters used during the freeze. We also installed an auxiliary equipment of four 50,000 gallon storage tanks, tank wagons, torches, filling buckets, thermometers, small storage drums for distillate, telephones and firing stations. From time to time these have all been added to by pumps and pipe lines for better distribution of oil, more heaters and more small equipment.

### Full Equipment

We feel that a properly equipped lemon orchard should have at least one heater to a tree of sufficient capacity to burn at least 15 hours with proper regulation without refilling. We very seldom fire more than 40 heaters per acre at the first firing, all heaters being set for a small fire, but if the night is very cold and prolonged the balance of the heaters are lighted before morning. The lighting torches are distributed at stations where they are easily accessible and known. On a large property it is very important to have distillate tanks of approximately 50 gallons capacity distributed around the groves, so that the torches may be refilled quickly and without confusion. The entire equipment should be so installed, not only to be

(Continued on Page 117)

# Imperial Valley Cantaloupes

## By H. H. Warner

GROWERS and shippers of cantaloupes in the Imperial Valley are now checking up their operations for the past season, and those who can point to any profits are laying their plans for another year.

The 1922 season will go down in history as remarkable for the speed and efficiency with which the railroads handled the largest number of cars of cantaloupes ever shipped from Imperial Valley. At no time was there a shortage of refrigerator cars even though for several days in succession the shipments exceeded 500 cars and on one day reached the unexpected total of 649 cars. Nowhere in the country are the railroads called upon to supply so many pre-iced cars in so small a territory in such a short time. The officials who were responsible for the organization which made this feat possible are certainly to be congratulated.

### Standardization Enforced

Never before has the quality of the early shipments been so carefully guarded. The county horticultural commissioner and his force of experienced inspectors handled this difficult problem without fear or favor, with the result that consumers were well pleased with their first taste of cantaloupes this season. They were not disappointed in the quality as has been the case so often before when the first shipments went forward without being fully mature. Strict enforcement of the fruit and vegetable standardization law this season and the resulting favorable impression on the Eastern consumers well demonstrates the justice of a law designed to protect the reputation of an industry such as this.

### Late Season Detrimental

In addition to planting the largest acreage on record, the growing season was such as to retard the normal maturity of the melons, and the season was approximately ten days later than usual. As is so often the case, if the normal development of fruits and vegetables is held back, both the early and late plantings tend to reach maturity at about the same time, and this fact contributed in no small measure to the very heavy shipments at the peak of the season. Fortunately, or not, as the case may be, the damaage from aphis and other pests was much less than usual this year and the quality of the melons themselves was as fine as has ever been shipped from Imperial Valley.

### Work Together

The office of the U. S. bureau of markets again assisted very materially in the equitable daily distribution of shipments. The value of this work depends almost entirely on the degree of cooperation extended by the various distributors. This season there were between 40 and 50 carlot distributors, many of whom did not appreciate the value or the necessity of this work and therefore were not as willing to cooperate as some of the distributors who, having had more experience in past seasons, valued the service more highly. It is to be hoped that the government office another season can be accorded unanimous support in this very important work in order that the service rendered can be of the greatest value to all concerned.

From a number of different angles it would appear that success in the marketing of Imperial Valley cantaloupes depends largely upon the degree of cooperation which the various distributors will undertake. There are a number of ways by which savings in the cost of operation can be effected by the willingness on the part of the distributors to work along the same lines without in any way suggesting a combination of shippers in restraint of trade.

### Consumer Advertising

One of the most important of the possibilities which has been overlooked to date is the matter of consumer advertising which could be handled effectively at a very small expense per crate if the distributors would join forces on a national advertising program designed to increase the consumer demand for cantaloupes at the peak of the season. All factors in the deal this year knew at the start of the season that shipments would greatly exceed those of any previous year, and furthermore that the peak would mean exceedingly heavy shipments for a comparatively short time, and that the normal carlot quota of many receiving markets would have to be exceeded during a part of the season. One of the large national advertising agencies attempted, just before the season opened, to interest the distributors in a comparatively inexpensive advertising campaign to run for a week or 10 days in the large city dailies at the time when heaviest supplies would be available. To the utter amazement of those who have had the value of consumer advertising demonstrated on other commodities, the factors who had the most at stake refused to take any action along this line. There is no longer any doubt but that a carefully planned advertising campaign conducted through the proper publications will materially increase the consumption of any food product. Of course considerable advertising is done by the distributors to the jobbing trade throughout the country, each shipper emphasizing his own particular brand, but only one organization so far has invested any money in consumer advertising.

To anyone who has given the matter study and watched the results, it is almost unbelievable that the operators in a deal representing an investment of millions of dollars would deliberately reject a business proposition in the face of a situation such as existed this year—a proposition which, at least, would have materially lessened the risk in the marketing of these cantaloupes, and would have stimulated the consumer demand.

### Wraps Should be Discarded

It has been repeatedly demonstrated that unwrapped or "naked" cantaloupes will carry better than wrapped stock, but on many markets where both kinds are available the wrapped cantaloupes command a premium, and therefore the custom is continued because the trade seems to demand it. Cooperation on the part of the distributors to eliminate the use of wraps would save more than enough to pay for a well directed national consumer advertising campaign, would improve the carrying quality of the melons, and would remove the temptation of hiding immature and poor quality melons under a wrap. If no wrapped stock were available, the premium would be more justly paid for strictly quality melons which the trade could recognize at a glance.

### Heavy Losses

It is needless to point out that as a result of heavy shipments to many markets, returns were far from satisfactory, particularly to the growers and shippers in the later producing areas of the valley.

A number of shippers whose acreage was located in the later producing areas of the valley will be forced to accept heavy losses this season on account of net returns being less than the advance guaranteed to the growers. It is probable that some of the smaller shippers interested in the deal for the first time will not be on hand again next season. Losses to both growers and shippers as a result of this past season have been very heavy, and the ultimate outcome has not yet been determined. However, it is reasonable to presume that certain risks can be eliminated from the deal if the growers and shippers will exercise a greater degree of cooperation in the future along the lines indicated above.

### Constructive Cooperation a Necessity

Each season for several years the distributors, facing a larger acreage and increasing shipments, have been haunted with the fear of overproduction. They have actually hoped for a car shortage or any other factor which would reduce the shipments. Some students of the problem believe that the Imperial Valley cantaloupe deal is suffering from the effects of too much or at least a destructive type of competition on the producing end. With this year's experience as a lesson, either the distributors must take a more constructive atatitude in the future or else the growers will gradually take the marketing more and more into their own hands. The danger of overproduction can be minimized through organized consumer advertising, large savings can be effected in the cost of handling through common agreement. If the shippers are not willing or are unable to work collectively along constructive lines in the marketing of the crop, the time will probably come before long when the growers will organize in such a way as to make possible the carrying out of a more progressive policy.

## CALIFORNIA LIMA BEAN GROWERS ASSOCIATION—REPORT FOR 1921

(Continued from Page 99)

direction, but need the membership support of more growers to enable us to make a nearer approach to this goal.

### Saving to Members

The bags and twine which the members recently purchased through the association will, conservatively figured, show them a total saving of between $15,000 and $20,000 as compared with what they would have paid if they had purchased from dealers. This added to a very substantial saving made in fire insurance cost due to special low rate secured on account of volume of insurance carried, would considerably more than pay the annual salaries of the manager, bookkeeper and stenographers together with office rental and supplies.

### Results Obtained

While the association's average price on 1920 and 1921 crops was unquestionably higher than the average price received by outside growers, it is certain that the growers would not only be able to secure a larger part of the consumer's dollar, without increasing the retail price, but several other benefits would accrue to the industry if an appreciably larger percentage of the growers would place their membership with the association.

Our meaning in the matter of securing for the producer a larger part of the consumer's dollar without increasing the retail price is well illustrated in what happened in the Lima bean market the past few months. Growers, not members of the association, sold many thousand bags to dealers at around 5½ cents, and a little later these same beans were sold by the dealers at around 9 cents and retailed to the consumer at 15 cents. This meant that the outside grower received about 36 per cent of the consumer's dollar. On the other hand, the association sold a good many thousand bags at 9 cents or higher, and the grower members' pool received the benefit of about 60 per cent instead of 36 per cent of the consumer's dollar.

Several other farm products have successful minority control cooperative marketing associations, notably cranberries, dairy products, poultry and eggs. The decision as to the value of an association having a minority control of the marketing of a product must rest with the members. Private gain or higher price is important, but it should not be considered the only worth while advantage of cooperative marketing, and it may be well to keep considering what would the grower have received if there had been no association?

### Returns and Payments

Prices ruled high at the opening of the 1917-1918 and 1919 crop seasons, and it was possible each of those years to advance the growers 5 cents per pound within about 30 days after the delivery of his beans to a warehouse. In 1920 and 1921 the much lower prevailing prices and the tightness of money made it impossible or impracticable to advance more than 2 cents per pound.

While fundamentally or theoretically the correct principle of cooperative marketing is to make payments to the grower members only as funds become available from the proceeds of sales, this method, if strictly adhered to, would work a hardship upon a large majority, so from a practical standpoint it becomes necessary to work out a plan that will be safe and yet give as liberal financial assistance as possible to members who require it.

Since the 2 cents per pound payment has not seemed to meet the need of many of our growers, the manager has recently secured the promise of large banks to finance the association in such a way that, with the approval of our board of directors, it will be possible around tax payment time in the fall to make further (above the 2 cents per pound) advance to members who so desire in amount to bring their total advance up to approximately 70 per cent of the estimated total recleaned weight value of their crop. This would mean 4 cents if growers selling price was around 6 cents, and 3½ cents if growers price should be around 5 cents per pound. The plan will probably call for members giving their notes to the association for the difference between their first advance payment of 2 cents per pound and this second advance, the notes to be liquidated by amounts due the grower from the association as funds become available from sales. However, this money will be obtained by the association and furnished to the member at less than current local bank rates.

### Stocks and Crop Prospects

All varieties of beans in the United States are more closely cleaned up now than they have been at this corresponding time for a number of years. This is due to very light total production last year and to very light importation of foreign grown beans, as stocks have moved into consumption rather slowly since prices jumped to 8 and 9 cents in March and Arpil.

California's 1922 crop acreage planted to various varieties of white beans is considerably increased over last year, and the growing plants are looking well and promising at this time. Similar report comes to us regarding increased acreage and crop prospects from the other large bean producing states of Michigan, New York, Colorado and New Mexico.

A cablegram just received from U. S. Consul Carter, through the state department, in answer to our inquiry as to Lima bean and crop and market conditions upon the Island of Madagascar, advises that the acreage planted to Limas there this season is 41,000 and that the quality of the growing crop now promises to be good. The total production is estimated as 19,000 tons, or 380,000 hundred pound bags, of which about 60,000 are reported sold.

You will note this indicates an estimated yield of about 950 pounds per acre.

Consul Carter also reports about 60,000 bags of old crop stock remaining unsold, with no buyers. England is reported to be receiving the bulk of the shipments from Madagascar, and it is estimated that about 160,000 bags of 1921 crop and 240,000 bags of older crops of Madagascar Limas are in storage in England unsold. We understand from the message that local bean dealers in Madagascar are trying to make sales of the coming crop at about 3 cents per pound there, but finding no buyers at present.

### Our Position

California Lima Bean Growers Association has established excellent market connections and facilities, and has good standing with the wholesale trade of the United States. It has through a term of years demonstrated its ability to sell large volume, and undoubtedly it could now easily sell a much larger percentage of the crop and at the same time secure better returns to the growers with greater satisfaction to distributors and equal or better satisfaction to consumers. Larger acreage and membership is required to accomplish this, and to this end we bespeak the continued and increased loyalty and effort of our present membership. The directors and employees of the association will do their best under the limits which are placed by the size and strength of our present organization. Suggestions which any member may offer for the good of the association will be appreciated and given thoughtful attention.

## COTTON GROWERS COOPERATE IN ALABAMA

About 30 per cent of Alabama's cotton crop is now under contract for cooperative marketing. 11,375 growers have signed up cotton marketing contract with the Alabama Farm Bureau Federation. This membership represents a production of 169,000 bales.

---

Utah reports an unusually heavy early flow of honey. In the Salt River Valley of Arizona the flow thus far is said to have been one of the poorest ever experienced, as the mesquite crop was almost a failure. A good crop of alfalfa and cotton honey is expected later in the valley.

# FUMIGATION—With Liquid Gas
## —Endorsed by Citrus Pest Control School

FROM reports made at the Citrus Pest Control School, held at Pomona recently, the superiority of fumigation as a means of combating scale is more definitely established than ever before.

In a well-prepared paper given by J. L. Prizer, superintendent of Bastanchury Ranch of Fullerton, fumigation was recommended as the best known means of controlling scale.

H. J. Ryan, horticultural commissioner of Los Angeles County, presented a number of charts showing the excellent results obtained by fumigation with liquid gas. In the upkeep of orchards it was shown that liquid gas registered 78%, while the next best method recorded 68%. Orchards neither fumigated or sprayed during the past year showed a deterioration of 45%, Mr. Ryan stated.

In tests made by M. B. Rounds, entomologist for the Azusa Foothill Citrus Co., liquid gas killed 93% of the insects, while the next best method destroyed 83%. Of the insects subjected to liquid gas, in a total of 8000 examined only 1.3% remained alive.

It was brought out during the meeting that liquid gas is fully as effective as either of the other methods of fumigation, and more economical. It was also pointed out that liquid gas is easier to handle and not so hard on the clothes or tents, and, therefore, superior in every way.

**Use Aero-Brand Hydrocyanic Acid and our devices for its application to obtain the best results in fumigation. Aero-Brand Acid diffused with our newly-perfected Jackson Pump is the most effective scale eliminator on the market, combining Accuracy, Simplicity, Safety and Dependability.**

# Fumigation Recommendations

**By R. S. Woglum Before Citrus Growers Institute at Pomona**

AFTER a season of severe crop loss in some districts and prospects in some cases of a short crop the coming season, many growers are looking toward a reduction in operating expenses. Fumigation, a costly practice, is likely to be one of the first cut. My observation has been that if any considerable amount of scale exists in an orchard the grower can ill afford not to attempt control if he can possibly finance the operation. There are already too many examples of four, six and upward box trees of high class fruit developing into two, one or even one-half box trees of inferior fruit from one or more season's neglect in scale control. By all means the grower should keep ahead of the scale.

Those of you who have decided to fumigate, and from my experience the spray is yet to be found that can equal fumigation in effectiveness for scale control, have the option of three methods; the liquid, the cyanofumer and the pot system. Which system is superior? Considering the discussions of the other speakers today and the prevailing opinion of many fumigators and inspectors, there appears to be no evident outstanding superiority of one system over the others in commercial work. Particularly so in these districts of black scale most resistant to cyanide gas where most of the comparative tests have been made. The experience of most speakers, however, does appear to indicate a slight difference in results between the different systems, and in all cases pot work appears the least favored, while liquid gas has an even draw with the cyanofumer.

Upwards of 75 per cent of all fumigation in California this last year was done with liquid gas. Districts in which the work was confined exclusively to this method appear to be less agitated over poor results than those in which the smaller proportion of the work was done with the liquid gas method. In Tulare County, a territory given over exclusively to liquid gas, the county commissioner reports that there was not a single poor job in over 2000 acres treated. Most other exclusively liquid gas districts report generally satisfactory work where the fundamentals of successful fumigation were carefully followed. Thus, when we consider that the bulk of the fumigation was done with liquid gas last year; that with the exception of a few districts and these for the most part districts in which the scale appears to be resistant to gas, the work was satisfactory; that in these resistant scale districts the cyanofumer and pot proved in no way superior, if the equal, of liquid gas; that the liquid gas apparatus is now entirely dependable and that the method is preferred by practically all fumigators—when we consider all these features it would appear that liquid gas is justly entitled to the position of predominant use it now occupies.

### Fundamentals of Successful Fumigation

Trees should be taped, not guessed, and dosed according to schedule.

A careful, experienced foreman is the keystone to safe, effective fumigation.

Use heavy dosages. Start with an 85 per cent schedule, if possible. Raise to 100 per cent as soon as the trees will stand the heavier dosage.

Fumigation during even a moderate wind tends toward poor results, and is advised against.

It is poor policy to fumigate orchards heavy in cover crop.

### Black Scale

Fumigate when in the youngest stages of development. Season generally extends August to December, some coastwise orchards excepted. Use 85 to 100 per cent dosage for one hour. Resistant type scale requires even more concentrated gas. If double fumigation, the second treatment should follow the first by two or three months.

### Red Scale

Middle of December to April is preferred season to fumigate for resistant red scale. One hundred twenty-five per cent schedule is commonly used on lemons, 100 to 110 per cent on oranges. Ordinary red scale can be fumigated at any time of year with 85 to 100 per cent schedule. Exposure 45 minutes or one hour.

### Citricola Scale

Fumigate during July or August with 100 per cent schedule; first part of September with 110 per cent schedule, if possible. Do not fumigate later than the middle of September.

### Purple Scale

Use 100 per cent dosage, if possible; never less than 85 per cent. Exposure one hour. Do not fumigate during the winter.

Fumigation of black or purple scales at temperatures near the freezing point often results in poorer scale kill than at higher temperatures.

### Cyanofumer

Test the cyanofumer for accuracy two or three times a week.

Stir the cyanide solution in solution tank before using.

Before fumigating a row, generate two ounce charges until the machine is filled with gas.

Cyanide solution will crystallize at temperatures around 40 degrees Fahrenheit.

The same dosage schedule is used for cyanofumer as for pots. For liquid gas a slightly different schedule is used in which the dosage for large trees is somewhat increased.

Liquid gas is inflammable. Keep open flames at a distance from drums or applicators.

Inspect and test applicators for accuracy every day before starting work.

Direct the nozzles of applicators away from the trunks of small trees to avoid injury.

The nozzles of applicators should not be placed among weeds or cover crop, and should be within the foliage fringe of the tree.

Results from atomized liquid gas appear to be most satisfactory at warm temperatures. Preferably should it be used at temperatures above 50 degrees.

Vaporized liquid gas gives a better diffusion within the tent than when atomized through a nozzle.

Eighteen cubic centimeters of high purity liquid gas is equivalent to one ounce of sodium cyanide for scale kill under field conditions.

### Injury

Avoid fumigating trees sprayed with Bordeaux mixture, or painted with Bordeaux paste high above the trunks, within ten months after application.

Fumigation with pot or cyanofumer should be stopped at 36 on damp nights, and on dry nights when the first warnings indicate that the temperature is likely to fall to freezing or below. Complete safety demands stopping at 43 to 45 degrees Fahrenheit.

Fumigation with wet tents is the cause of severe injury. Work should be stopped before tents become wet.

Sunshine is one of the most harmful agents to plants in connection with fumigation. It exerts an influence both during and after the treatment. Safe sunlight fumigation requires the proper knowledge of dosage, exposure and temperature influences. Without this knowledge daylight fumigation should not be attempted.

In the coastwise districts it is generally unsafe to fumigate above 75 degrees Fahrenheit; in hot interior districts where the trees harden up in summer, work appears to be carried on with safety even as high as 85 degrees.

Sulphuric acid will burn canvas. Therefore care should be exercised to avoid the residue from cyanofumer or pots coming into contact with tents.

Fumigation during periods of desert or "electric" winds sometimes produces severe fruit injury.

Trees in bloom can be fumigated with safety with moderate dosages.

Fumigation should precede rather than follow an irrigation.

Hydrocyanic acid is one of the most deadly gases known. Particular care should be exercised in handling liquid gas. Two men should always be present when filling the machine. If a man is overcome by gas have him breathe ammonia fumes and induce respiration by movement of arms and walking, if possible.

The grower might well keep a watchful eye on his fumigation. At such times a midnight pot of coffee and doughnuts for the crew might prove a good investment.

### THE LOS ANGELES COUNTY FAIR

The directors of the Los Angeles County Fair to be held at Pomona October 17-20, are making rapid progress with the plans for holding a big show. A large tract of land has been secured and plans drawn for permanent buildings and a race course. Part of the buildings are now under way. The fair ground and improvements are being built by the people of Pomona and are designed for the holding of an annual Los Angeles County agricultural exhibit. The County of Los Angeles has appropriated $10,000 to be offered as premiums, and Pomona has added $4,000 more to this fund, making one of the largest agricultural premium lists in California. In the livestock department judges of national reputation have been secured and from present indications one of the largest livestock shows ever seen in California will be staged at Pomona this fall.

Proof

There's only one Caterpillar Holt builds it

More convincing than anything that may be said about "Caterpillar" T35 Tractor is the evidence of what this tractor is actually doing in service. Study its design and specifications and you will find features of simplicity, superior materials and construction, perfect lubrication, complete enclosure from dust and dirt. Watch its performance in the field and you will see how these features are translated into greater power, amazing economy and enduring service.

Ask where you can see a T35 at work, or, if you need more than its 15 drawbar horsepower, get catalogs on the larger Holt tractors—the 5-Ton, Western 10-Ton or 75 h. p. "Caterpillar" Tractors.

# Moving Valencias

By Ernest Braunton

THE task of moving 7,800 Valencia orange trees, six years old, on the Limoneira ranch, Santa Paula, has been completed. The task was begun the last week in May and ended July 15. But commencing April 1 and continuing until the commercial transplanting began, about 50 trees were moved, several by each of several methods, such as bare rooted, balled, boxed, heavily pruned, lightly pruned, partially defoliated, completed defoliated, etc.

A Cultivator representative makes regular pilgrimages to this ranch to view the work and its progress, and while much of interest may be recorded no definite conclusions can be drawn. One curious fact is that transplanted trees have ranged in "breaking out' with new growth, from 10 to 67 days, while two moved early have not yet resumed top growths, though bark on even the smallest twigs is still green, tender and juicy.

But two changes were made after the work was well under way. First, the crane was discarded as being of no use for bare root trees, but will be employed on balled or boxed trees used in replacement. The ropes formerly tied about roots are therefore dispensed with, saving time and material; and one man, with help of loader, can easily land trees on the truck.

At the earnest solicitation of two friends, recognized horticulturists of standing, Mr. Culbertson put on two additional and competent men to prune roots with greater care. These trees will be recorded and results watched in years to come. In addition in every other row the root stubs will be painted. A careful examination of the transplanted orchard makes the observer quite exultant, for it would appear that success is to result from this great experiment. The work has been splendidly executed. The total cost, including sharpening of tools and other incidentals, will not vary much either side of $2.50 a tree.

The trees in the trial plat are in all stages. The boxed trees started first and strongest, perhaps; the balled trees are a good second, but the bare root trees have also started, and as their transplanting cost but half or less than those boxed or balled, we will have to wait and get final results. Will the boxed or balled trees yield a year before the others? And will the crop more than pay for the extra cost? Will the trees for all time or for a few years prove in any or all ways the best? These questions the Cultivator will endeavor to answer when definite results have been noted or as soon as fairly intelligent forecasts can be made.

# California Field Crops, July 1

By California Cooperative Crop Reporting Service

E. E. Kaufman, statistician, California Cooperative Crop Reporting Service, comments:

### Indian Corn

Acreage estimated same as last year when 116,000 acres were grown for all purposes.

Condition 90 per cent nomal as compared with 87 last year and a 10 year average of 90. Indicated production 4,072,000 bushels. United States planting 103,234,000 acres. Production 2,860,245,000 bushels.

### Wheat

Wheat 91 per cent normal as compared with 80 last year and a 10 year average of 78. Preliminary estimate of area harvested 693,000 acres, probable crop 13,243,000 bushels.

United States production forecast winter wheat 569,276,000 bushels; spring wheat, 247,660,000 bushels.

### Oats

Crop improved slightly the past month. Present forecast of production about 4,859,000 bushels compared with 3,780,000 last year. No change in acreage.

United States oats 74.4 per cent normal as compared with 77.6 last year and a 10 year average of 85.5. Forecast 1,186,626,000 bushels.

### Barley

The barley crop is estimated at about 36,720,000 bushels.

U. S. production forecast at 181,586,000 bushels, last year's, 151,181,000.

### Rice

Area sown to rice 142,000 acres. Sutter, Butte and Yolo Counties show slight increase, decrease in Glenn, little change in Colusa. Assuming average conditions until harvest and that the estimated acreage planted will all be harvested, forecasted production is 3,655,000 bags—100 pounds each.

Estimated area planted in the United States is 1,009,000 acres, producing 39,085,000 bushels.

### Potatoes

Potatoes show slight increase planted as compared with 1921, 74,000 acres, this year about 76,000. Condition 95 per cent normal. Forecast of production indicates 11,335,000 bushels as against 10,064,000 in 1921.

In the United States production estimated about 428,607,000 bushels, as compared with 346,823,000 in 1921.

### Sweet Potatoes

Area planted 9,000 acres. The condition is 94 per cent normal as compared with 93 last year and a 10 year average of 93.

In the United States there has been a slight increase in the area planted.

### Grain Sorghums

Slight decrease in the area planted, 133,000 acres against 145,000 last year. Condition slightly better, total production about 120,000 tons.

### Cotton

The estimated area of cotton in California, including the Imperial Valley, planted and standing as of June 25, about 210,000 acres as compared with 140,000 in 1921. Condition on June 25 showed material improvement during the month, and forecast of production would indicate about 123,000 bales. Total acre estimated 145,000 acres in lower California, California proper, some 65,000 acres. Revised figures for 1921 crop show 140,000 acres picked, including all the Imperial Valley, with a production of 75,600 bales, 500 pounds gross.

### Hops

Reports as of July 1 from hop growers and dealers indicate decrease in acreage, leaving estimated total for the state at 11,000 acres as compared with 12,000 in 1921. Condition of the crop better than last year, indicated production about 100,000 bales.

### Sugar Beets

Condition about 85 per cent normal as compared with 85 last year and a 10 year average of 89. Preliminary estimate on acreage for all factories available about third week in July.

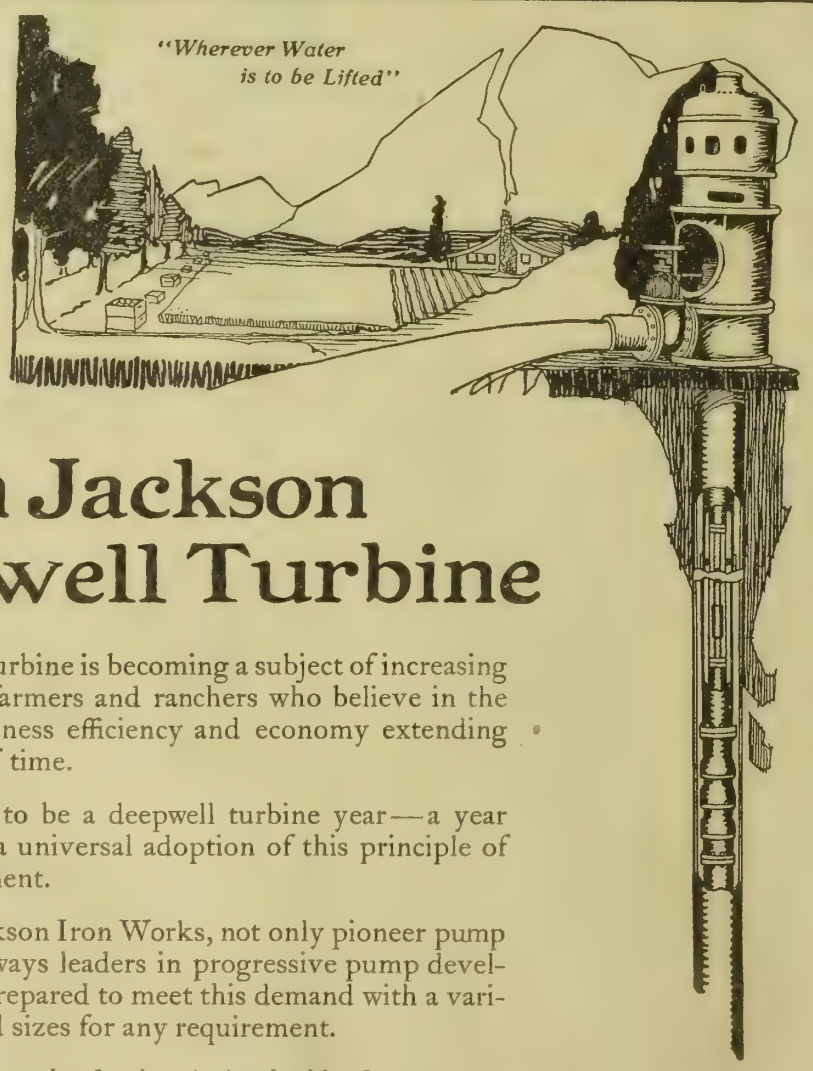
### Beans

Preliminary estimate Lima beans (which includes Baby Limas), about 125,000 acres, as compared with 101,000 acres harvested in 1921.

Beans other than Limas increase of 18 per cent, or 201,000 acres as against 171,000 harvested last year. Black eye acreage in Orange County greatly reduced. Santa Barbara shows increase in area planted to beans other than Limas, predominating variety being Small White.

Condition of all beans estimated 90 per cent normal as compared with 80 last year and a 10 year average of 88.

*Standard of the World*



**The Byron Jackson Deepwell Turbine**

The deepwell turbine is becoming a subject of increasing importance to farmers and ranchers who believe in the practice of business efficiency and economy extending over a period of time.

This promises to be a deepwell turbine year—a year that will mark a universal adoption of this principle of water development.

The Byron Jackson Iron Works, not only pioneer pump builders, but always leaders in progressive pump development, have prepared to meet this demand with a variety of types and sizes for any requirement.

## GUMMING OF FRUIT TREES

By Leonard Coates,

From Cultivator's Questions and Answers column it would seem that the gumming of fruit trees is more prevalent, and its cure, or prevention, no better understood. The cause may be a mechanical injury, or it may be a bacterial disease superinduced by uncongenial conditions. No doubt an excessive early flow of sap, which may be checked by subsequent cold weather, is not conducive to the well being of a tree, especially if the bark of the tree does not expand or check readily or naturally. For this reason a gentle slitting of the bark, if done early enough, is often helpful. To save a tree, like an apricot, cherry or prune, which suddenly begins to exude globules of gum in the spring, it is absolutely necessary to act very promptly, and, perhaps, vigorously. Use the knife at once, cutting out the bark where discolored by gumming. If a branch, or the whole top, is very badly affected, saw off the branch or branches. Cover cut places with a Bordeaux paste. In nearly every case the tree may be saved, but all depends upon prompt action at the first signs of gumming.

Where conditions are more or less severe, as to climate, heavy rainfall, or sudden changes of temperature in the spring, prunes and apricots on peach root are less liable to gum than those on Myrobolan root.

## BEAUMONT HAS HAD SUCCESSFUL CHERRY SEASON

Manager A. H. Smith of the Beaumont Fruit Growers Association writes:

"This association has handled 175 tons of cherries, and a careful estimate of the fruit handled outside the association and of that sold by individual growers at their orchards, is 150 tons, so that this valley has produced in the neighborhood of 325 tons of cherries this year.

"This has been a very successful season. The best prices were received for the Bings this year, as the market was best at the time this va-

riety ripened. About 50 tons of Royal Annes were sent to the Golden State Canneries at Ontario from this valley, and the rest of the cherries were sold in the green fruit market, shipments being made both east and west of Beaumont.

"There were some trees 12 years old which bore six or seven hundred pounds, and many which averaged three to four hundred pounds apiece, and several orchards of five acres had from 14 to 18 tons."

## CITRUS GROWERS' DEPARTMENT

The following is the executive committee of the newly formed citrus department of the Los Angeles farm bureau: Col. Frank Firey, Pomona, San Antonio district; B. W. Chambers, Los Angeles. La Canada Valley district; B. Bolle, Lamanda Park. Pasadena and Lamanda Park district: Harry Damerel. Covina, Covina district; C. J. Pegler, Sierra Madre, Sierra Madre district; R. F. Radford, Monrovia, Monrovia district; M. B. Rounds, Azusa, Azusa district; W. G. Fields, San Dimas, San Dimas district; Harry Wood, Puente, North Whittier Heights district; Fred Palmer, Walnut, Spadra and Walnut districts; J. B. Vail, Claremont, La Verne district; F. L. Maurer, Rivera, Rivera district; Sam Mendenhall, Whittier, Whittier district; J. H. Allen, San Fernando, San Fernando district; L. Loyd, Owensmouth and Chatsworth district; C. W. Cook, Burbank, Burbank district.

## GRAVENSTEIN GROWERS AGREE ON SHIPPING

At a special meeting of Sebastopol and Napa Gravenstein apple shippers and packers at Sebastopol July 5, cooperating with the state department of agriculture and the county horticultural commission, it was decided that no carload shipments should be permitted to move before July 17 and that nothing but 3½ and 4 tier stock should move up to July 20. There will be no changes in the inspection policy that prevailed last season, either as to charges, fees or quality of fruit admitted to the different grades.

## 50,000 ACRES OF NEW SUN MAIDS

Vineyards planted in California this year under the Sun Maid banner should reach a total of about 50,000 acres, including Malaga grapes, according to an estimate which has been made by F. C. Goodwin, head of the crop contract department of the Sun Maid Raisin Growers.

Of this number, Goodwin estimates that 10,000 acres have been put in Malagas, 30,000 acres in Thompsons and the remainder in Sultanas, Muscats, Feherzagos and other varieties.

## NEW YORK PLANT SPECIALIST AT POMONA COLLEGE

Dr. A. B. Stout of the New York Botanical Gardens at Bronx Park is to spend a year's leave of absence from New York at Pomona College. Dr. Stout describes as his particular field, "that of sterility and fertility with reference to crop production." It is expected that his work in a new department of horticulture will contribute definitely to the upbuilding and welfare of the community.

## THIS YEAR'S PEACH CROP

Peach crop in California is estimated by the U. S. D. A. at 16,863,000 bushels from indications on July 1. Last year's crop was 12,848,000 bushels. Estimate for the nation is 54,302,000 bushels this season. California's nearest competitor as a peach state is Georgia with 5,206,000 bushel crop.

## WOULD LIKE THEIR GROVES BACK

Cuban orange and grape fruit packers are repenting at leisure. If an orange or a grape fruit tree grew as fast as sugar cane, there would be less remorse. When sugar prices in the United States began to rise and then sky-rocket to the well-remembered 30 cents vast stretches of Cuban orange groves were torn up and planted in sugar cane; other groves were abandoned entirely and have received no care for the past three or four years, Consul Horace J. Dickinson at Antilla, Cuba, states in a report to the department of commerce. As a result of this but 1,000 boxes of grape fruit will be shipped from Omaja this year, while less than 1,000 boxes have been shipped from Sabanaso. At Omaja there are about 2,000 acres still left of grape fruit and oranges, but less than half have received little or no care during the last few years.

## SHIPPING POINT INSPECTION

The shipping point inspection service on fruits and vegetables, inaugurated as a result of a memorandum of agreement between the state department of agriculture and the federal bureau of markets and crop estimates, has now been in operation a little less than two years, and during that time about 16,000 carlots of fruits and vegetables have been inspected and certified. The demand for the inspection service is constantly increasing and, based on present indications, it appears that during the coming 12 months as many carloads will be inspected as during the past two years.

The service has now been in operation long enough to demonstrate its practicability and commercial value. The certificates of inspection issued by the state department of agriculture are prima facie evidence in the courts of this state and are accepted as evidence in any court in the country. They indicate that a trained, impartial third party in the form of the state department of agriculture has examined the carload of fruits or vegetables in question and has described its quality and condition as fairly and accurately as possible. The certificates are continually being used in the case of railroad claims against the carriers, and on the other hand, the carriers, just as anxious to know the exact facts surrounding a given shipment as the shipper, are paying more and more attention to the work. The future outlook for the work is promising.—F. W. Read, chief, bureau of standardization, California department of agriculture.

## THE COTTON TRADE

Fluctuations in cotton prices continued wide and irregular during the week ending July 14, accompanied by reports of continued unsettled financial and political conditions abroad, and of serious spreading of the boll weevil with consequent uneasiness as to the probable extent of damage from this and other insect enemies of the crop. On July 14 the bureau of the census reported that consumption of cotton by American mills during the month of June amounted to 507,869 bales, exclusive of linters, compared with 461,917 bales in June 1921. The census report shows also that imports of Egyptian cotton for the 11 months ending June 30, were 228,433 bales of 500 pounds, compared with 84,716 bales for the corresponding period last season.

Total stocks of cotton in the United States on June 30, in accordance with statistics compiled from reports of the bureau of the census, amounted to 3,593,966 bales, compared with 7,425,055 bales on same date lastyear.

Not even USCO ever touched this value before

30 x 3½ - $10.90

WHEN you look at a 30 x 3½ USCO at $10.90 think back for a minute as far as you can remember USCO.

The truth is that men have *always* found USCO an outstanding money's worth no matter what its price.

Today at $10.90 USCO maintains its established standard of quality.

And because of the new price, it sets a *new index of tire value.*

* * *

Men who have used USCO have never been inclined to measure its value by the general run of tires.

Since last fall when USCO established the $10.90 price range they have recognized it as a value beyond *any possible comparison.*

A still greater money's worth than even USCO itself had reached before.

30 x 3½ USCO $10.90

*No War-Tax charged*

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Potato Second Growth

What causes potatoes to make a second growth? My potatoes looked fine, bloomed, the bloom dropped and then they began to send out new growth and are now blooming again. Is there any way to prevent this?—Subscriber, Geyserville.

There is but one cause for potato second growth—soil moisture. This may be because too late an irrigation was given, water level has risen from irrigation elsewhere, or soil is naturally very moist. There is no way to prevent it except as may be suggested by the cause. One piece of advice should be heeded, however. Under such conditions dig potatoes immediately.

### Filling Squirrel Holes

I would appreciate a reply through your column to the problem stated: In the bank of a creek, having a direct drop of some 60 feet, there is an old squirrel town. There are from three to five feet of soil above a gray hardpan or rock which crumbles after exposure to the weather. Squirrel holes extend inland, in one case causing an irrigation leak about 90 feet from the edge. Irrigation leaks have enlarged the holes, forming small caves near the outlets. I have been advised to dynamite the rock formation that it may drop down and fill up the openings; also warned not to use explosives on it, as this would open up cracks in the rock and make more leaks. What is the remedy?—Subscriber, Modesto.

A piece of land similarly worked by squirrels was once owned by the writer and reclaimed by running the squirrel and badger holes full of earth while the water was going into them. First poison the squirrels, then when water is turned on the land and finds its way into a squirrel runway, fill it with earth as fast as the water will take the earth away and until the hole is stopped. We have had some runs hold a wagon load of earth, but when the work was done it was finished and no further trouble. Holes near the bluff may be hard to fill, but if a smaller stream of water is used and earth thrown in fast enough to make a mixture the water cannot carry rapidly, the hole will soon fill, and when they are filled five or six feet below the surface there will be no further trouble. We think dynamite would close many of the holes along the bluff to advantage and would not open any that could not be filled by the method described.—J. B. N.

### Clearing Land

I want to clear land of large trees, brush and poison oak. Can you tell me cheapest and best way?—Subscriber, San Francisco.

The brush and poison oak is not a serious problem. The size, number and nature of the trees would determine the most economic procedure. Dynamite is largely used, for the least a charge will do is to blow soil, rocks, etc., from under stumps so roots are exposed for cutting. This is the cheapest and quickest way to remove the soil. On the other hand, there are effective stump pullers that will accomplish more with some kind of trees. We would advise writing to firms advertising giant powder and stump pullers in the Cultivator, stating kind, size and number of trees to be removed.

### Soil Already Filled

Property is surrounded by large elm trees. What fall blooming bulbs will grow in the yard? The roots run across yard and so fill the soil that nothing but lawn grass will grow. Shrubs and roses are soon choked out and larkspurs, zinnias and other annuals have been tried unsuccessfully. Will dahlias thrive there?—Subscriber, Porterville.

Nothing will thrive there; the soil is already too full. The top roots of elms may be cut and taken out without harm to trees. Then dig in rotted manure and plant anything in the bulb line that is in season, and it will grow.

### Rhubarb Rotting

Rhubarb roots set out last spring made vigorous growth but lately stopped, some leaves wilted. Found ants running over plants and roots. Drove them away with coal oil but found that center bud or heart of plant is dead and dry. What is the matter and the remedy?—Subscriber, East San Diego.

One could hardly diagnose such a common trouble without seeing an affected root, perhaps not them. Rhubarb roots decay in this manner without seemingly any direct cause, though of course there is one, yet every lot of any size has similar troubles. This heart rot, according to local horticulturists, is ever present.

### Gum on Pecan Trees

Kindly inform me cause of young peach trees gumming, just set out last spring; also remedy? Since writing above received my Cultivator and note article on gumming for prunes and plums. Shall I treat peach trees same way?—Subscriber, Sacramento.

Yes; also apricots and cherries, in fact all stone fruits.

### Cutting Sudan for Hay

Answering query of Chino subscriber as to when Sudan grass should be cut for hay, H. L. Musser writes:

"Sudan grass should be cut for hay just after it has bloomed and when the seed is beginning to get hard. At this stage it will dry to the best advantage and furnish the richest feed. All stock are very fond of it. It has not become popular with dairymen because they say it is not a milk producing food."

### Corn Worm in Garden

In the control of the corn worm I have had success by cutting the end of the ear square off, after the corn is well formed and the worms have not got down far. A little care will show how far they have gone, and keep cutting until the worm is found. About ten days before the corn would be ready for eating is the best time here. The ends with the worms we destroy, using care that they do not have a chance to do any more damage. We like your paper much.—Nicholas Anderson, Ramona.

### Capri Figs

I have 12 white fig trees about ten years old. Some of the figs get sour each year and will not dry Our horticultural commissioner told me to get Capri figs, but the price is a dollar a dozen, and I want a dozen for each tree. Cannot I get them cheaper, and where?—Subscriber, Hemet.

You should first determine if you have Smyrna or Calimyrna figs. If you have not, the trouble is from other cause than lack of pollination. Other figs are "fig-shaped," but those named are short-necked, broad, and flat on the lower end, some nearly the shape of a mature onion. If you have these you should purchase one or two Capri fig trees, which may be supplied by any firm advertising fig trees in the Cultivator. Some of these dealers also supply Capri figs in season.

### Army Worms

Can you give us any information in regard to army worms? How long after eggs are deposited does the worm appear?—Subscriber, Fairmead.

The common army worms, the dull-colored ones, of several species, require eight to ten days. The beet army worm and the yellow striped require about a month.

### Rust on Beans

What should be done with string beans to prevent rust or blight (turning brown of leaves long before they should)?—Subscriber, Pasadena.

Dusting with sulphur is the best preventive for rust on string beans. Blight is also controlled to some extent by sulphur, but the use of Bordeaux mixture is more effective for this disease.—D. F. R.

### Bothersome Bees

Would like to know what can be done to prevent bees from a close by apiary annoying stock. The apiary is not provided with water for bees, and they so annoy and sting people and stock that we can hardly get water for selves or stock in safety. Is there any way the apiary can be compelled to furnish water for bees, or have we any redress?—Subscriber, Elsinore.

This is an old source of trouble that nothing can change. If you could identify and impound the offending bees you might secure legal redress or at least force the owner to keep his

bees from trespassing on your property. No satisfactory adjustment seems possible, for lack of provision of water for bees cannot come under the ban of the law against cruelty to animals. If one attempted to poison bees through setting vessels of poisoned water he would doubtless be liable to arrest for malicious mischief or something worse. We are sorry we cannot advise a remedy for what is evidently a great and unjust annoyance.

### Commercial Fertilizer for Potatoes

Has anyone in California had any success using commercial fertilizers in growing potatoes? If so, what was the analysis and how much per acre did they apply?—Subscriber, Springville.

Commercial fertilizers are used very extensively in growing potatoes, one carrying potash is particularly desirable. We would recommend a formula of approximately 5 per cent nitrogen, 8 per cent phosphoric acid, 1½ to 2 per cent potash at the rate of 400 pounds per acre. Communicate with your local dealer or with our advertisers who handle fertilizers, who will be glad to give you their formulas with advice on prices.—D. F. R.

### Blister Mite

I am enclosing leaves from Bartlett pear tree. Half of the leaves are so affected. What is it and what shall I do for it?—Subscriber, Devore.

This is blister mite for which spring spraying with lime-sulphur has been advised, but for two years experiments have proven that it is better to spray in the fall, just as the pear leaves commence to fall..

### Shot-hole Fungus

I am sending you a few apricots badly cracked open and otherwise ailing. The trees were sprayed with lime-sulphur just before they bloomed and have been irrigated once a month since the rains.—Subscriber, Wilmar Station.

You spray a little late; spray when first buds are open and spray with 5-5-50 Bordeaux instead of with lime-sulphur. Aside from cracking the fruits have shot-hole fungus. The moisture conditions have not been uniform, which causes cracking of skin. Either you have not irrigated heavily enough or often enough; the practice to be governed by soil texture, etc. This inconstant soil moisture always produces cracked skins.

### Weeds in Roads and Paths

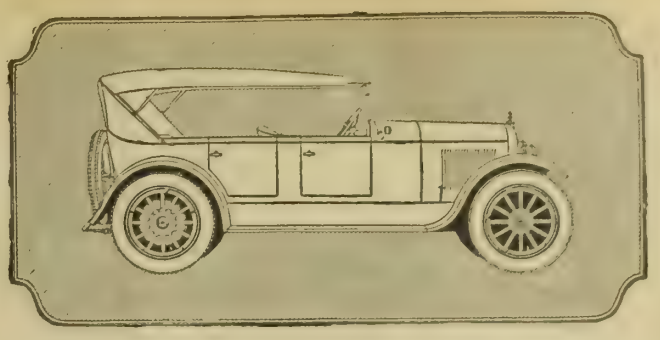
What do people do to keep graveled walks and drives free from grass and weeds? We cannot dig them out and we do not know how to fight them.—Subscriber, Tancred.

Under the above head we published formulas and treatment in the Cultivator of June 4, 1921, pages 738-9. The article is too long to republish but a copy is sent you by mail. The materials recommended by the United States department of agriculture, are caustic soda (sodium hydroxide), two pounds; or high grade concentrated lye, three pounds; white arsenic, four pounds; water to make one gallon. This mixture will make 50 gallons ready to apply to the weed infested soil. Common salt and oil are the only two other materials that are recommended as weed killers.

### Wild Strawberries

Can you tell me the name of a strawberry plant that bears its first crop in clusters of round fruit while the second crop is shaped like butterflies? They are very fine eating and also very hardy plants and can stand more alkali than other berries. Where can I get plants?—Subscriber, El Cajon.

We do not know a named variety such as you have described, but you have mentioned peculiarities common to the wild strawberry, Fragraria Chiloensis, from which our cultivated varieties came. This species also stands alkali and drouth well. The berries are not large but of finest flavor and borne in abundance. The plant is used as a ground cover, and the agricultural hall and other building at the University of California, Berkeley, are surrounded with it. Perhaps some of our readers know of a named variety having the good points mentioned.



## Earl power and economy make it the recognized farm car

A great increase in Earl sales in the smaller cities is the most striking fact in recent Earl history. Earl dealers in these cities report that a large number of the cars already delivered or now on order have been sold to discriminating farm owners, after exacting road tests and comparisons with other cars—many much higher in price.

To the makers of Earl cars this is great and significant news. Any good car can meet the requirements of the average city dweller, with brick and asphalt under his tires and only occasional runs into the country to tax his machine.

To satisfy the men who live and produce in the country, however, a motor car must be able to stand up under all kinds of weather and road conditions. It must be comfortable and safe and easy on the roughest highways. It must have power to spare in the deepest mud and on the longest hills. And to earn its keep, it must be economical.

The Earl is built to meet just these requirements. Its powerful, long-stroke motor and balanced chassis deliver greater mileage per gallon of gasoline than any other car of its size or price. It is easy to drive, easy to keep in order, easy on your pocketbook at all times.

Earl values are outstanding. Size them up for yourself at the nearest Earl dealer's. Write to the factory for the illustrated catalogue of five great Earl models—*now*.

### ALL IN THE STATE OF MIND

I

If you think you are beaten you are,
  If you think you dare not you don't.
If you'd like to win, but you think you
    can't,
  It's almost a cinch you won't.
If you think you'll lose, you've lost,
  For out in the world we find
Success begins with a fellow's will,
  It is all in the state of mind.
Full many a race is lost,
  Ere ever a step is run,
And many a coward fails
  Ere even his work's begun.

II

Think big and your deeds will grow,
  Think small and you'll fall behind.
Think that you can and you will,
  It's all in the state of mind.
If you think you're outclassed, you are
  You've got to think high to rise.
You've got to be sure of yourself before
  You ever can win a prize.
Life's battles don't always go
  To the strongest or fastest man,
But sooner or later the man who wins
  Is the fellow who THINKS HE CAN.

—By M. McGrath.

### THE FAIRY CHILD

**By Marianne Gauss**

**(Concluded)**

So, carrying the stranger child, she followed her path. As she went, the noises of the snow—twigs settling with its weight—seemed like footfalls of unseen passersby. The rising wind tossed the branches until they cracked like whips. Her feet ached from cold as she plunged on through the snow; in the darkness she had lost her shadowy path. And all the while the little stranger of the storm clung to her with both hands and feet.

She walked a little way down a ravine; when she climbed out she felt the full force of the wind. The snow had stopped and she could make out through the darkness a dim shape that proved to be a barn. Some one had stored wild hay there during the summer; but there was no house near by.

"Well, baby, we've found a shelter," Fay began—and stopped, for it seemed queer to be talking to the strangely silent child.

The hay in the barn was warm and fragrant. Fay gave the child a lump of sugar that she had carried for her pony. He was evidently used to caring for himself, for when she laid him down he promptly burrowed into the hay.

Hours later, warm and tired, she fell asleep.

In dreams nothing is impossible. Fay dreamed that morning came, that she opened her eyes, and that during the night the strange child had turned into Bunny. She thought she held out her arms and he leaped into them from his little bed, just as he always had. He kissed her neck and tickled her with his fingers.

She woke—in the barn. It was midnight; and her heart beat violently, for voices had startled her in her sleep. She could hear them outside the place. She remembered that her footprints were plain in the snow leading to the barn door—and by now the moon was out.

The barn door opened, and some one came in with a lantern; it was Jim.

He came running toward her. "O Jim, be careful of the baby!" she cried.

He thought that she was dreaming about Bunny.

"Jim, I'm wide awake. I found some one's baby in the snow." She stopped bewildered—for the tiny stranger had vanished.

"You must had dreamed that, Fay."

Fay was searching the hay. And she soon found the baby, who had burrowed surprisingly far into his fragrant bed.

When they reached home, it was Jim who carried the strange child into the house. As Fay was warming her chilled hands, trying to unfasten her cape, Jim's nephew, Bobby, cried out, "O Auntie Fay, it's a papoose you found! It's an Indian baby!"

"Heat some milk, Fay," said Jim. "And—I say, Bobby, get some water to wash it."

It seemed to Fay that it would break her heart to give a strange baby its bath. She brought the warmed milk, but she let Jim and Bobby wash and care for the child.

"It belongs to that Indian outfit that broke up and moved on today," said Jim. "Just possibly it's an ill-luck twin. Some of the old timers among those Indians never raise twin papooses; they think it's bad luck. They'll give them to the mission schools or leave them for some one to pick up."

"An ill luck twin, indeed!" cried Fay. "How dear, how cunning he is!"

And she touched the baby's cheek.

"It didn't have much on," said Jim: "just a blanket, and a shirt that looked to me as if it had belonged to a much older child."

Fay turned away. She thought he was going to ask her for some of Bunny's little clothes; but he did not. He dressed the papoose for the night in a night suit that belonged to Bobby.

In the morning he said to her, "Fay, I think I'd better ride up the canon, hunt up that Indian outfit and see where the youngster belongs."

He went into the next room. "Fay," he called back to her, "did you see the little shirt the papoose had on?"

"Why, no!" she answered. And then, "I think you put it in the stove, Jim. Never mind. Of course he shall have Bunny's things."

After a little the door closed behind Jim; she heard him mount and ride away, although it was scarcely light. He had not slept at all, and he was to be gone all day.

When he returned, she decided, he would find this baby dressed in Bunny's clothes. She kept them in a trunk: the dear, tiny baby colthes, the first short ones, which had long been outgrown, and the last—which would never be outgrown.

If Bunny had been there,—prattling, loving the baby, getting in her way,—what joy it would have been to give away his clothes! But the day passed, and she could not dress that other baby.

At last, when she had prepared supper and set it to keep warm, she went and dropped on her knees beside Bunny's trunk. She lifted the lid. Everything smelled of violet powder. She seized some little, rolled up stockings, undergarments and a dress. There was a celluloid duck for a baby's bath—she could not take that.

When the Indian baby was dressed in Bunny's white clothes,—it had been easier to take a Sunday frock than the rompers,—she held him in her lap and stroked his head.

"Aunt Fay," asked Bobby, "what made Uncle Jim take that little old shirt with him?"

"Why, to help find the baby's mother, I suppose. Run and fix the bed for the baby, dear. He's asleep now."

"Why don't you light a lamp? There's Uncle Jim."

Fay was laying the stranger child down when she heard Jim's step at the door.

"Did you find out about the baby, Jim?"

"Yes, and I found something else."

She and Jim had often spoken of the chance that their drowned baby might be found. Her heart beat hard.

"You know that little shirt the child had on?" asked Jim. "I knew it."

"Oh Jim—it wasn't Bunny's!"

"I was afraid to tell you. You'd had so many false clues."

"And the Indians took Bunny out of the river? Hurry, Jim! Tell me!"

He came in. Its was growing dark in the room. He put one hand on her shoulder and gently forced her down into the rocking chair. "Yes, Fay, they found him—away up in the canon. He was playing by the river."

He laid something on her lap. It was Bunny—alive—well. Bobby lighted a lamp, and Bunny woke. With a little gurgle of surprise he found himself at home.

By the next day—all over the house, underfoot, pulling himself up by daddy's leg or mother's skirt—he had forgotten that he had ever been away. The papoose was his delight.

As Jim had guessed, the papoose was an ill luck twin. But the mother, a young Indian squaw, did not believe in the old superstition. She had begged Jim to keep the poor little twin for a few days until she could find a place for it, where it would be safe from the medicine man.

"Ill luck twin!" Fay murmured. "Blessed fairy child that brought me my heart's wish!"

## The Cultivator Patterns

**4051. Misses' Dress**—Cut in 3 Sizes: 16, 18 and 20 years. An 18 year size requires 5⅛ yards of 32 inch material. For trimming as illustrated 1⅜ yard is required. Price 10 cents.

When you order a pattern
We want to know:

**Your Name!**
**Your address!**
**Your size!**
**Number of pattern ordered!**

We can't fill your order unless we have this information. A number of orders for patterns are now held in this office because no name was signed or address given.

### HOUSEHOLD QUERIES

**Sour Cucumber Pickles**

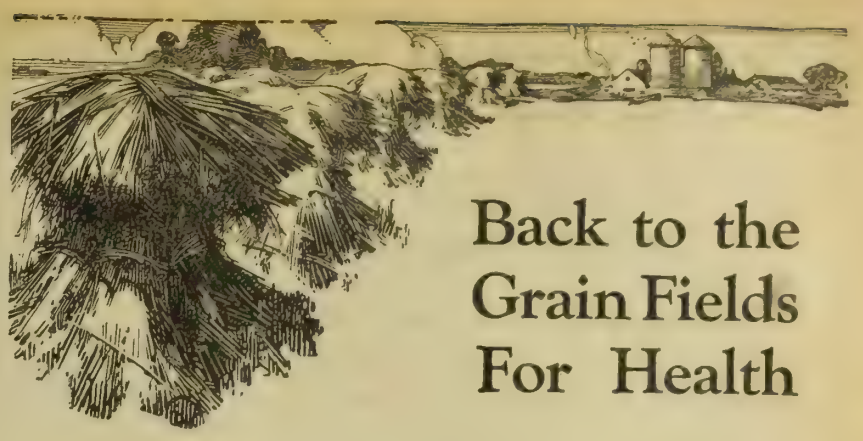
Will you kindly tell how cucumber pickles are made as ordinarily found on the general market? If the method is not possible for home use will you give method yielding results as nearly as possible the same?—Subscriber, Pasadena.

Choose small cucumbers. Prepare a brine of 2 pounds salt per gallon water. Place cucumbers in this and keep them submerged with wooden float. Store in this brine for about 4 weeks. Fermentation will take place and a scum will form. If pickles become soft add more salt. After about four weeks remove cucumbers and heat in a large amount of water to the simmering point for about 20 minutes. Discard this water and cover with fresh water. Heat to simmering point, remove from fire and let stand about two hours to soak out excess salt. If pickles tend to be soft or "flabby" add a tablespoon of alum per gallon water. Rinse in cold water. Drain. Store in strong cider vinegar of good quality until reaady for use. If at any time the pickles soften or mold, place them in fresh vinegar. Pack in wide mouth corked bottles or in jars with glass tops. Do not use metal.

**Peptin for Jelly**

I have seen in the Cultivator where you answered a subscriber about buying peptin for jelly. I have tried myself to get peptin in every store in Merced and they don't know what it is. I have such trouble getting my apple jelly jelled and I have followed directions exactly as stated in the recipes. Now if you please would be so kind and give me the firm's name where I could get that peptin. I have no luck in making jellies from apricots or pears or cherries. All I can get is thick like syrup but not really jellied. I asked in the drug store and they gave me citrus acid. Is that any good to use in jelly?—Subscriber, Merced.

See answer to "Jelly from Sweet Fruits" on page 85 of last week's Cultivator. No doubt this inquirer is using too much sugar in proportion to juice. Also, we wonder if she is not trying to make large quantities at a time. It is much better to make not more than 3 or 4 glasses at a time by quick boiling in shallow pans. Juice from sour apples requires only ½ cup of sugar added to 1 cup of juice to make it jelly. If more is added it becomes syrupy. We are sending this inquirer copy of the Cultivator of June 17 which contains a splendid article by A. W. Christie, giving directions for making jelly with fruits sweet and sour, with much pectin or little. This article is invaluable. Also we are sending address of firm carrying pectin for jelly making. With apples there will be no need of pectin added if amount of sugar is cut down as suggested. The citrus acid would not add pectin to the juice but would help to jelly it by balancing the oversupply of sugar. Remember that fresh, sour fruits like apples, cranberries, loganberries, currants, jelly easily with ½ cup sugar to 1 cup juice; apricots, peaches, pears are sweet and have little pectin so it is best to add acid juice like that from sour apples—the article by Mr. Christie explains fully why and how. We have not space here to repeat. But here is a hint. Try jellying one cup of juice; if it is syrupy add less sugar or more acid juice; if it doesn't jelly, add more sugar or juice containing pectin—apple juice. Don't mix all juice at once.



# Back to the Grain Fields For Health

Grape-Nuts is a regular "three bags full" of the best food qualities of whole wheat flour and malted barley, carefully mixed and slowly baked—

To develop all their appetizing flavor,

To preserve all their wholesomeness,

And to provide nature's "broom" that keeps the digestive system spick and span.

There's not a bit of artificial sweetening in Grape-Nuts—it just *becomes* sweet of its own accord in the long baking.

And that enticing flavor—how good it is with good milk or cream! Fruits, too, fresh or cooked, add to the delight of a dish of Grape-Nuts, morning, noon or sundown.

It is a compact, ready-to-eat food—no cooking needed. Why not try it for tomorrow's breakfast?

# GUERNSEYS
AT
## AUCTION
## Friday, August 4, 1922
One O'Clock
Riverside, California, Fair Grounds
36 Cows—6 Heifer Calves—4 Bulls

The Cream of the CLAREMONT HERD
Owned by L. D. Smith, Hydesville, Calif.

An excellent lot of well bred animals in fine condition, all tuberculin tested and from a clean herd. A destructive fire upon our place makes it necessary to reduce the herd.

CATALOGS NOW READY
Sale Under Management of
PACIFIC PURE BRED SALES COMPANY
C. R. Thomas, Sales Manager
808 Santa Fe Building, San Francisco
GEO. A. GUE, Auctioneer

Italian Vineyard Company
GUERNSEY CATTLE
Herd Headed by the King of Hollow Hill
BERKSHIRE HOGS
Stock of Both Breeds For Sale
Alex. Wilson, Supt. Guasti, Cal.

GUERNSEY BULLS
Service Age
Have a couple crackerjack sons of the $10,000 bull, Pencoyd's Golden May Secret, ready for service.
Priced reasonably.
G. T. DRINKWATER
Lakeside, San Diego Co., Calif.

GUERNSEY COWS
produce practically all of the milk in this country which sells at a price considerably above the market price of ordinary milk. Guernsey grades produce the same kind of milk and they are in demand at good prices.
Every grade dairyman should own the best Guernsey bull he can buy. Write us if you want Guernseys.
ROSEMOOR FARM
W. H. Dupee, Owner Riverside, Calif.

46—REGISTERED—46
# SHORTHORNS
at Public Auction
Carruthers Farms, Live Oak, Calif.
Wednesday, August 9, at 1 P.M.
In this offering the owner, Mr. W. M. Carruthers, comes close to realizing a long cherished ambition—to make a public sale offering of high class Shorthorns of his own breeding. With a very few exceptions the choice cattle in this sale were all calved on Carruthers Farms.
31 Heifers in the Sale
Mr. Carruthers is selling all of his heifers older than calves at foot, practically all of Scotch pedigree and including some real show ring prospects. Both bred and open heifers make up the group, presenting a most attractive selection of foundation material.
Some Choice Cows Will Sell
A limited number of choice cows will round out the female offering, some with calves at foot, others well along with calf.
11 Choice Bulls in the Offering
Of the eleven choice bulls to sell, about half are ready for service, the balance well grown calves. Some show prospects among them.
This is conservatively one of the most attractive Shorthorn offerings made in California. Guaranteed breeders and tuberculin tested.
TERMS OF SALE—The sale managers will extend the usual terms of one-half cash, balance in six months, to responsible parties who arrange for credit before sale.

Herd Bulls
Harris Standard 2d
Beau Blanchard 76
Nevada Hereford Ranch
J. H. Cazier & Sons
Wells, Nevada
A government accredited herd. No reactor in 16 years. A herd whose record in the show and sale ring is only surpassed by the esteem accorded its productions by cattlemen. We can furnish bulls or females to fill any need—and at sound prices. Visit our herd or write for information.

S. M. S. RANCH, STAMFORD, TEXAS
California cowmen who wish to improve their cow herds have a rare opportunity to draw from the 1,000 bred twos S. M. S. heifers and unbred yearling heifers in lots of one or more cars. Write for particulars.
S. M. S. RANCH, SWENSON BROS., OWNERS
Frank S. Hastings, Manager Stamford, Texas

TOP QUALITY, BOTTOM PRICE
Registered Holstein Bulls For Sale
From Cows with Official Production Records. Sires all from Cows making Yearly Records. 1000 lbs. to 1200 lbs. Butter and 22,000 lbs. to 31,000 lbs. Milk.
Buy one and breed profit-making cows.
Los Angeles County Farm, Hondo, California
3 Miles south of Downey on Downey-Long Beach Blvd.

DIAMOND G HEREFORDS
13 choice yearling heifers, sired by a son of an International Champion, well grown and just the sort for starting a profitable herd. Also 10 yearling bulls. Come and see them; the price is right.
H. H. Gable Esparto, Cal.

# Livestock Problems

By R. A. Condee

THE matter of having properly fitted collars on work horses is especially important during the hot summer months.

### Properly Fitted Collars

Sore necks may be caused by overloading, improperly balanced machinery or by poor drivers who do much unnecessary backing. If none of these cause the sores, then the collar is too short. About 90 per cent of collar trouble is caused by short collars. Sometimes this can be remedied by removing some of the packing in the top of the sweat pad. In doing this, however, lumps are often left in the pad which in many cases causes a worse sore. Collars that are too long or draft that is too low may cause bunches or sores low down on the shoulders. Improperly fitted hames also cause similar trouble. In some cases this can be corrected by placing a folded grain sack between the sweat pad and the top of the collar. A large horse should have long hames, so the draft will be higher. Sores high up or in the middle of the shoulders are generally caused by wide collars.

A properly fitted collar is one that lies snugly along the sides of the neck with room enough at the bottom to allow a hand to be passed through. Sweat pads aare necessary to adjust the collar to different horses and are also made necessary by the loss of flesh; a collar that fits perfectly in the spring may be too large by fall.

### Castrate Young Boars

Most hog raisers hold their surplus young boars too long before castration. The best time to castrate young boar pigs is between six and eight weeks of age, before weaning. By performing the operation at this age the young pig is still sucking its dam and is small enough to be handled conveniently and the testicles large enough to render the operation quite simple. The objects of castration are to prevent reproduction, increase fattening propensity, better the quality of the meat and help insure docility. Every swine breeder should be competent to castrate pigs. Any one who has not performed this operation will find Farm Bulletin No. 780, U. S. Department of Agriculture, Washington, D. C., very helpful.

### Cow Comfort in Hot Weather

During the hot summer months many high producing cows are prevented from giving their normal supply of milk by carelessness of their owner in not supplying some one of the many necessary comforts for hot weather milk and butter fat production.

One of the most common of these is the furnishing of drinking water.

A cow in milk requires about 100 pounds, or 12.5 gallons, of water daily, and heavy producinig cows frequently double this amount. During hot weather a cow must have the normal supply of water and an added amount necessary for adjusting her supply from normal to hot weather needs.

The question of how often cows should be watered, when they are not kept with a constant supply before them, varies with the condition of the weather, kind of feed, etc. It is safe to say, however, that cows in milk should have water at least three times a day.

### Silo a Necessity

The silo has come to be recognized as a necessity on farms where ten or more dairy cattle are kept. In fact it is now recognized as the most profitable building on the dairy farm.

In installinig a silo make it to fit the size of your herd. The diameter should allow you to feed your herd at least two inches off the surface to prevent surface spoilage, then make it deep enough to last as long as you expect to feed during the year; for example, two inches per day for 180 days would require 30 feet of settled silage. A silo ten feet in diameter will feed 12 cows 35 pounds of silage per day. This is considered about the right amount to feed producing milk cows.

Corn, either Indian or the grain sorghums, makes the best silage.

However, it is best to choose that crop which, on your farm, can be successfully matured for silage and which gives the greatest feeding value per acre at the lowest cost.

The proper stage at which to harvest the silage crop is an important question. Cutting too green sacrifices too much growth and feed value and makes acid silage; cutting too late causes poor packing and spoilage. A good rule in harvesting Indian corn for silage is to cut just before the kernel glazes, and in the case of Dent varieties, after the dent is well formed.

In refilling a silo see that it is in ship-shape before starting the filling. In the case of wood silos it is a good plan to paint the inside with a good asphalt paint and see that the hoops are properly adjusted and tightened. Silage cut to half inch lengths and well packed is well worth the extra cost of cutting.

## INCREASED PREMIUMS AT STATE FAIR

The state fair which is to be held at Sacramento, September 2-10, has made a considerable increase in the premiums to be paid in the livestock departments this year over previous years. Especially is this true in the cattle division, which has a premium list this year of $16,167.50. For Shorthorn beef cattle the premiums total $3000, an increase of $660 over 1921; Herefords $3,000, an increase of $750. In dairy cattle an advance of $100 in each class has been made. Premiums for Holstein-Friesians total $1,436.80, dairy Shorthorns $1,514, and other dairy breeds $1,214. Premiums for milk goats total $1,004, an increase of $693 over last year's list.

Slight increases are made right down the line in the sheep division, the premiums for which total $3,882. Swine premiums are $3,971, exclusive of special prizes, such as $1,500 offered for fall and spring pigs by the National Duroc-Jersey Record Association, and $1,000 in the Poland-China futurity. Another slight increase is noted in the department of dairy products, premiums for which total $1,098.50.

The educational department also shares in the general increase in premiums. This year's list totals $3,240, an advance of $1,000 over the list of last year. In the student judging and livestock department, the premiums total $990, exclusive of special prizes from the California Cattlemen's Association, California Jersey Breeders' Association, California Swine Breeders' Association, American Shropshire Registry Association, Western Berkshire Congress and others.

## GUERNSEY SALE AT RIVERSIDE

The sale of registered Guernsey cattle to be held at the Fair Grounds in Riverside on August 24 should not be overlooked. An unusual opportunity will be presented to those needing milk producing cattle to get something good. The cattle will be sold to the highest bidder. They are yours at your bidding. No protection will be thrown around any of them. It is a most useful offering. All are splendidly bred, are good individually, are in good condition and tuberculin tested. The sale is under the management of the Pacific Pure Bred Sales Company, C. R. Thomas, sales manager, 808 Santa Fe building, San Francisco.

## PROPOSED BUTTER STANDARD

The join committee on standards has adopted a new butter standard providing that butter must contain not less than 80 per cent butter fat or not to exceed 16 per cent moisture. This is an unofficial committee representing the department of agriculture and state food control officials, and the standard will not become effective until it is finally approved by federal and state secretaries of agriculture.

# Financial Interest Jerseys

During these days of shifting ownership of purebred livestock it is refreshing to find a breeder who has built up a herd of purebred dairy cattle along constructive lines, one who has never deviated from his original objective. Such a breeder is Harry H. Cook of Chino who has during the past few years developed a herd of Financial Interest Jerseys to a point where they stand in the front rank of both producing and show Jerseys in the west. Recent butterfat records, made by Mr. Cook's Financial Interest bred Jerseys bears out the statement he made some years ago that "The Financial Interest Jerseys are the result of the nicking together and intensifying of the two greatest Jersey blood lines in America, the Golden Fern Lads and the Financial Kings, which gives them size, type, constitution, temperament, longevity and production."

One of the oustanding cows in this herd of top Jerseys, Regia Rowena, No. 394362, has just completed a 365 day record, qualifying in Class AA, and making her a gold medal cow. Regia Rowena produced 730.16 pounds butterfat from 1185.3 pounds milk in 365 days. She is a daughter of Rowena Interested Fern who has over 20 daughters in the Register of Merit. Regia is the second daughter to make the gold medal class, the other one, Fern Silver Ray, made 779 pounds butterfat in a year and was formerly state Jersey champion in her class. The record Regia Rowena, just finished, makes her the third highest Jersey butterfat cow in California, the other two being Interested Jap's Santa and Fern's Silver Ray. Regia Rowena's breeding is Golden Fern Lad on the top side and traces to Pedro and the famous sire, Stokes Pogis on the dam's side. Another cow in the Cook herd of Jerseys, that is attracting a great deal of attention among dairymen is the senior four year old, Shylock's Gay Bettie No. 476505. This splendid young cow has just finished her 365 day test as a four year old, carrying off the California state championship honors in her class. She produced 670 pounds butterfat during the year test. Shylock's Gay Bettie is a great granddaughter of Financial Countess, world champion Jersey cow in 1907, with a record of 952 pounds butterfat in one year. Financial Countess is a half sister to Financial King's Interest. This great cow proved the longevity claim for the Jersey breed by producing 20 calves in 21 years, 19 of which were heifers. The last two years of her test she produced 805 pounds butterfat and dropped three calves.

Shylock's Gay Bettie also traces to Golden Fern Lad on both her sire's and dam's side. Mr. Cook contends that this cow is another conclusive proof of the soundness, of the theory and good judgment of D. G. Whiting in his breeding plans started over 30 years ago.

This four year old has not only won a state production championship but has also qualified as a silver medal cow, (producing 500 pounds butterfat while under five years of age).

In her three year old form this cow produced 513 pounds butterfat in one year, on twice a day milking. Shylock's Gay Bettie dropped a fine bull calf at her last freshening, which has developed as a yearling, into an outstanding individual. This youngster with the breeding and production back of him should make his mark at the head of some Pacific Coast purebred Jersey herd.

All the records made at the Cook Dairy are produced under normal conditions and no attempt is made to force the animals on test. In fact, the Cook Jerseys are carried on a well equipped 40 acre dairy farm midway between Chino and Ontario, and are intended primarily to furnish milk for a high class private trade in the city of Ontario.

## GOES TO PACIFIC INTERNATIONAL

The matter of sending a California high school judging team to either the Chicago International Livestock Show or the Pacific International Livestock Show at Portland, Oregon, was one of the principal topics of discussion at the conference of California agricultural high school teachers held at Davis' farm school, July 11, 1922. A cordial invitation was received from President E. A. Stuart and Manager O. M. Plummer of the Pacific International, as well as from E. E. Elliott, state director of vocational education of Oregon, urging the California schools to send their judging team to Portland to compete with the high school teams from the other Western states.

After much discussion it was decided to accept the invitation of the Pacific International and send one or more California high school judging teams to Portland next November. It is planned to hold two large high school judging contests in California this fall, one at the California state fair in September, and one at the Southern California Fair at Riverside in October. The three winning teams from each of these two fairs will then

TARX
SOLIDIFIED DISINFECTANT

**A Better Dip in a Handier, Cheaper Form**

Comes in cube-marked cakes instead of cans. Solid like soap. You simply cut off and drop one of the handy Tarx cubes in a gallon of water and you have 1 gallon of the best dipping and disinfecting solution you ever used.

**Each Cube Makes 1 Gallon**

No guess work—no waste—no bother—no leakage—no breakage. You pay nothing for bottles, barrels or cans. No freight on factory water which you can just as well add at home. Easily shipped anywhere. Packs in small space. Keeps indefinitely.

**Order Direct from This Ad**

Send only $2.50 (check or M. O.) for 5-lb. package. Makes 150 gallons. Shipped prepaid. If you are not pleased your money will be refunded. You take no risk. Send today.

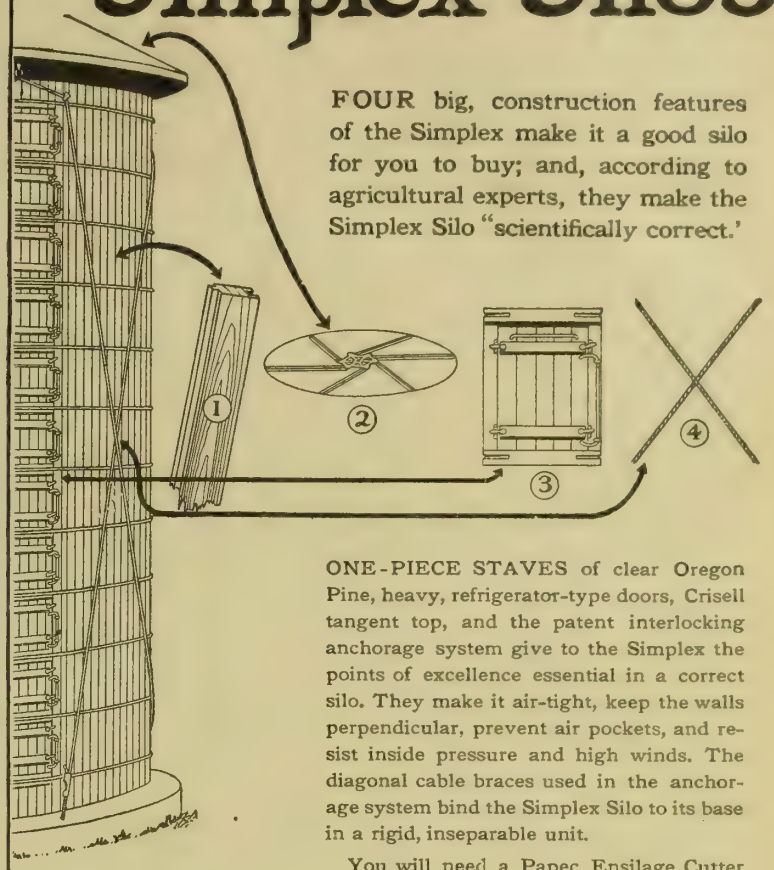
W. F. YOUNG, Inc., 244 Temple St., Springfield, Mass.

**4 Important Features of Simplex Silos**



FOUR big, construction features of the Simplex make it a good silo for you to buy; and, according to agricultural experts, they make the Simplex Silo "scientifically correct."

ONE-PIECE STAVES of clear Oregon Pine, heavy, refrigerator-type doors, Crisell tangent top, and the patent interlocking anchorage system give to the Simplex the points of excellence essential in a correct silo. They make it air-tight, keep the walls perpendicular, prevent air pockets, and resist inside pressure and high winds. The diagonal cable braces used in the anchorage system bind the Simplex Silo to its base in a rigid, inseparable unit.

*Four Simplex Features*

1. Continuous, one-piece staves.
2. Crisell tangent top insures true circle.
3. Hinged, refrigerator-type doors.
4. Interlocking, diagonal cable bracing.

You will need a Papec Ensilage Cutter to complete your equipment for feeding ensilage. Six fans on the cutting wheel of the Papec give it a number of advantages that we will be glad to tell you about.

Tell us how many head of stock you have to feed and for how long each year you will feed ensilage, and we will tell you what capacity your silo should be.

**Santa Fe Lumber Co.**

18 California St., San Francisco, Calif.

*Just fill in and mail this coupon.*

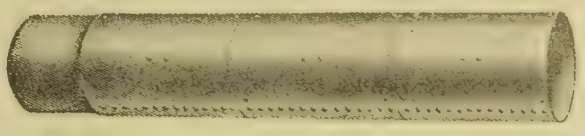
**You Should Not Buy a Bull Unless:**

You have seen his dam and know that she is the type you want his daughters to be.
Or you have seen a good picture of her with a close-up picture of her udder.
She is a big producer of milk with a high percentage of fat.
Our cows are the tops of all the big sales in the state for the past three years.
Practically all of them have high 7 day and yearly records. They hold 4 world's records.
Our herd bull is Sir Aaggie De Kol Mead, whose five nearest dams average 1130.66 pounds of butter in a year testing over 4%.
You should have one of his sons out of a high record dam.
Call or write for our long-time, easy payment plan.

Lankershim, Cal. Fred Hartsook Ranch

Visitors always welcome.

**Tanks, Well Casing, Water Pipe**



**American Steel Pipe Tank Co. P.E. Bldg., Los Angeles**

go to Davis farm school and hold an elimination contest to determine the team that is to represent California at the Pacific International. J. B. Lillard, state supervisor of agricultural instruction for California, is in general charge of these contests, and Prof. E. H. Hughes of the division of animal husbandry, University of California, will act as superintendent of both contests and coach for the teams that go to Davis for the final tryout.

## HOG CHOLERA INCREASING IN NORTHERN COUNTIES

Recent investigations in several California counties have shown that cholera in hogs is spreading in certain districts, due apparently to lack of appreciation by hog owners of the importance of early recognition of the disease. The situation is not yet sufficiently serious to necessitate placing a quarantine on the movement of hogs in these counties, but unless prompt cooperation can be had with the local hog raisers, this drastic recourse may be required to guard adjoining counties and those parts of the state where proper precautions are observed to prevent such "flare ups" of cholera. While outbreaks of this disease may occur sporadically in any part of the state at intervals there is no excuse for a general spread throughout any given territory if hog owners will properly dispose of animals that have died of cholera and will avail themselves of existing prophylatic measures.

### Vaccination Effective

In some instances the presence of disease in herds was not reported to the division of animal industry until after the lapse of two or three weeks by which time all the susceptible pigs were infected. It must be understood that there is no cure for cholera. Drugs and chemicals of all kinds have proved worthless either as a cure or preventive. Proper anti-hog cholera vaccination however is effective in protecting hogs so treated from contracting the disease but is of no value when given to a pig already visibly sick with the disease.

### Watch Your Sick Hogs

An outbreak of cholera is usually preceded by the death of a single hog in a herd, followed after the usual period of incubation by the appearance of sickness in a number of hogs in the herd. No attention is paid to the death of the first hog as the owner does not suspect cholera, but when a number die he is worried and seeks assistance. A high temperature ranging from 105 to 108 in a hog showing extreme prostration evidenced by a staggering gait, should be enough to give a clue that cholera may be present. Prompt attention at this stage of the infection should result in saving the rest of the animals. No time, however, should expire between the appearance of cholera and vaccination; else both the hogs and price of vaccination may be lost.

### Don't be Careless

In order to prevent the spread of cholera to healthy herds it is necessary that all infected hogs be confined in small enclosures. A cholera hog should not be allowed on range or in fields where it may come in contact with non-infected hogs. Flies and insects may carry the infective discharges from the eyes and noses of sick hogs. Sick animals should be kept strictly isolated. Animals that have died should be burned, together with any loose litter or refuse in pens and yards. The practice of hauling carcasses off to the woods or fields or burying in shallow graves shows an utter indifference to the welfare of other hog owners in the community. Spray hog houses and fences with a five per cent solution of any good coaltar disinfectant.

The cooperation of all hog owners is requested by the division of animal industry to control the spread of this disease. Call your local veterinarian or notify the state department of agriculture by letter or telephone. The United States department of agriculture has stationed in California Dr. Robert Jay, a hog cholera expert, who functions jointly with the state department of agriculture at Sacramento and the state university, and who will investigate and advise hog owners regarding any suspected outbreak of this disease. The services of the field veterinarians of the California department of agriculture are also available to hog raisers in combating this or any other infectious disease.

Hog owners should bear the following points in mind: Early diagnosis is imperative. Suspect cholera when the first pigs become sick. Isolate affected animals at once. Burn all cholera carcasses immediately. Disinfect premises after removal of sick animals.

# Livestock News Notes

### LIVESTOCK SALE CALENDAR

**Shorthorns**

August 9, Carruthers Farm, Live Oak.

**Guernseys**

August 4, L. D. Smith, Riverside Fair Grounds.

**Holsteins**

August 17, Jas. McGillivray, Sacramento.

August 30-31, Dispersal, Maxwell Farms, Hollywood.

**Jerseys**

August 20, Dispersal, W. H. Rough herd, Riverside.

Harry Wilson who was formerly with E. C. Shroeder and Fred Pabst and later with the Bridgford Holstein Co. and Palo Alto Stock Farm in this state, has taken the position of herdsman with the Berylwood Stock Farm at Hueneme.

The report of the Stanislaus County Cow Testing Association for June shows that the 1,255 cows tested averaged 684 pounds milk and 27 pounds fat. 141 cows made over 40 pounds fat for the month. A registered Holstein owned by E. W. Looney of Salida, headed the list with 104 pounds fat from 3,027 pounds milk. Six Brothers Dairy, F. L. Hogue and Kaiser Brothers followed in order, all with registered Holsteins.

The usual June break in the price of hogs did not occur and leaves the hog market in better condition than for some years past. Usually during June the price of fat hogs drops from two to three dollars per hundred but this year maintained the price around $10.50 to $11. From now on the price should remain steady if it does not increase a little as the offering will be less until the new crop is ready for the market.

The Bridgford Holstein Co. of Patterson has sold the great bull, King Segis Alcartra Prilly, to Fred Pabst of Milwaukee. This bull has six times been grand champion in leading shows and his daughters are a most remarkable group of producers. He heads the list of prize winning sires for 1921-22.

The Western Berkshire Congress will meet at the Travelers Hotel, Sacramento, on September 5, 1922, at 8 p. m. All Berkshire breeders and others interested in Berks are urged to attend. This will be in the evening after the Berkshire judging at the state fair.

H. C. Merritt, Jr. of the Tagus Ranch at Tulare has added a fine junior yearling Poland China gilt to his show herd in Sunkist Maid which he bought from P. B. Long of Tulare. She is by The Sunbeam, one of the popular boars of the Middle West.

Fred Hartsook of Lankershim is sending out a big show herd of Holsteins which will take in the principal fairs this fall. In order to round out his herd Mr. Hartsook has recently purchased a 1200 pound record cow from Frank Hatch of Modesto, and a two year old heifer from the Maxwell farms. The two year old is sired by Sir Ormsby Skylark and is out of the 1200 pound yearly record cow K. S. P. Lily McKinley. Mr. Hartsook also bought a bull from A. Pasti of Atwater. This youngster was sired by King Korndyke Pontiac 20th and is out of the great Higdon cow, Mona Fobes. The Hartsook show herd will number about 28 head and will be able to show three get of sire.

# Give Your Cows a Chance

## Help Them Make Money for You

Don't handicap them by giving them dry, withered feed that has no milk possibilities in it.

Give them nourishing, juicy, milk-producing silage, the kind that comes from an

# Ideal Green Feed Silo

By the use of the Ideal Green Feed Silo you have the advantage of green pasturage during the winter months—the time when dairy produce is at its highest price.

The Ideal Green Feed Silo will pay for itself every season, and possibly twice a season. It is the most economical investment you can make on your dairy. Built of clear, dry redwood—the everlasting wood—and held together with hoops of steel. Fitted with refrigerator doors.

Let us tell you about this wonderful silo. You need our booklet on silage. We'll send it FREE for the asking.

Two new cold storage plants will care for fruits and vegetables of the San Bernardino Valley this year. One at Redlands is completed and another is being built at San Bernardino.

# ECONOMY STOCK POWDER

Is a scientific combination of roots, herbs and sodas. The effect is to sweeten the stomach, purify the blood, regulate the bowels, liver and kidneys, remove the worms, strengthen the nerve centers and aid digestion.

You should take every precaution with your hogs at this season of the year. Do not allow your little pigs to get wormy and constipated. If you do, they are much more susceptible to disease and you are liable to have trouble.

## Economy Germicide Dip

**Disinfectant — Germicide — Antiseptic**

Do not overlook the importance of using plenty of good dip around your hog pens. Spray the troughs and the sheds regularly to kill disease breeding germs. Spray or dip your hogs and keep them free from lice.

We shall be glad to send a FREE SAMPLE of Economy Stock Powder and our BOOKLET on hogs to anyone writing us for same.

**Economy Hog and Cattle Powder Company**

# The Egg Market

By J. H. Barber, General Manager Poultry Producers of Central California

The recent slump in the San Francisco egg market from 32 cents to 28 cents on Extras was due to the fact that the price had advanced to a point high enough so that some of the cheaper lots of storage eggs could be taken out of storage and sold at a profit. Between July 1 and 10 there were 3500 cases withdrawn from storage in San Francisco. These were chiefly mixed colors and other cheaper grades. They of course took the place of a similar quantity of fresh eggs, causing an accumulation of the unsold fresh.

Los Angeles, which had been taking a considerable part of the local surplus, declined to buy at the advanced prices, and this threw further supplies on the San Francisco market. With local production still in excess of consumption the pressure to sell the accumulated supplies broke down the market to 28 cents.

At this level some dealers were willing to put away eggs for short holding. The demand for this purpose absorbed the immediate surplus and steadied the market. Dealers interested in moving out and selling the cheaper storage eggs then started a move to get the price up again. It advanced to 29 cents, and on Friday was expected to go to 30 cents, but in the face of liberal supplies the buying support was not strong enough to accomplish this and the quotation remained at 29 cents.

### Prospects

The immediate future of the local market is going to depend on three things: first, the amount of local production; second, the desire to get storage eggs moving out; third, the course of the New York market.

The outlook is that if local production of fresh eggs drops below consumptive needs, the price will advance again to a point where some of the storage eggs can be moved out at a profit. These storage eggs will supply the demand and thus prevent the market from advancing further. Of course, if the New York market, which has weakened in the last few days, should decline further, or if our market should advance to a point where shipments were certain to make a loss, the eggs that are now going to New York—or at least a considerable proportion of them—would be thrown on this market and it would have to come down to a point where they could begin moving out eastward again with a fair chance of at least breaking even on them.

The weakening of the New York market has resulted from the same cause as made the market drop here. New York also had advanced to a point where storage eggs could be moved out and the use of storage eggs in place of fresh arrivals compelled the cutting of prices in order to keep the fresh eggs moving into consumption.

In fact, the situation is just the same all over the country. There are considerably more eggs in storage this year than there were last year, and last year there was the largest amount of storage in the history of the trade, with one exception. It seems to be well recognized that unless the storage eggs can begin to move out into consumption early there is bound to be considerable loss on some of them at the end of the year, just as there was last year. Naturally, everybody who has eggs in storage is anxious to avoid a repetition of last year's losses on the eggs held after the end of the year. It looks very much as if it would resolve itself into a question of whether holders of storage eggs are going to be willing to sell them without profit or at a very small margin in order to get them moving early.

With merely normal production of fresh eggs during the fall, if the storage eggs can be moved out in considerable quantities during the summer and early fall, there is a possibility that the storage deal may close up without serious loss. If, on the other hand, fall production should be as much in excess of last year in the country at large as it has been so far this year, there is no doubt that a good many storage eggs will have to be sold at a loss.

Under these circumstances, it is a matter for congratulation that our association storage holdings are comparatively light. While storage holdings on the Pacific Coast are considerably in excess of last year, and in the entire United States very much so, our association has only about one-third as many eggs in storage as we had last year. When the government storage report of May 1 came out the management decided that the storage outlook was going to be very dubious, and we therefore concluded to store very conservatively.

# Poultry Queries

Conducted by Jean A. Koethen)

### Disinfecting Incubators

Should I disinfect my incubators; if so, what should I use?—Subscriber, Bakersfield.

The incubator should be thoroughly washed and sprayed before and after every hatch. Wash with soap, water and a good scrubbing brush, and a few hours before putting in the eggs spray all parts of the incubator with cresol, or a five per cent solution of carbolic acid or with carbolineum. Washing with water containing a few drops of creolin answers the same purpose.

### Too Fat for Summer.

Our chickens, old and young, are dying by the dozen. They lose control of their legs and die in less than 24 hours. They have free alfalfa range, roost in the open, have plenty of sour milk and have had plenty of corn until three weeks ago when we changed to wheat because they were getting too fat.—Subscriber, Holtville.

It is possible that your chickens have been poisoned by something they found on the range, gopher poison, perhaps, or a spray that had been used on trees, but more likely their overfat condition has caused heat prostration. Of course you are providing shade, and the alfalfa range gives them the best possible feed for hot weather, but you will have to reduce them as rapidly as possible. For a few days alfalfa and milk with whatever fruit and vegetables are available will be sufficient. After a week give a little wheat in the evening. In the hot interior valleys of the state corn cannot safely be fed to chickens during the summer. Half a teaspoon of epsom salts to each bird, given in wet mash, will be a help in reducing.

## CALIFORNIA EGG LAYING CONTEST

### High Pens for June:

## LAKE POULTRY CLUB EXHIBIT

The Glenn County club agent has been conducting an egg laying contest in the Lake district, and this formally closed with an exhibit by each club member of three of his best hens, picked by himself, at the regular Lake center meeting on the evening of July 6. Wm. Spiers of the Lake district, who is an old hand at the poultry business, acted as judge and awarded the first prize to a pen of Leghorns owned by Leo Weber, second to a pen of Rhode Island Whites owned by Gladys Brown, third to a pen of Plymouth Rocks owned by Francis Bautsch. One of these Plymouth Rocks was declared the best hen on exhibit.

## FROST PROTECTION ON RANCHO SESPE

(Continued from Page 101)

ready at all times, but to be able to be gotten under fire with the least possible delay. Although not essential to their lighting we have our heaters wicked with excelsior so that they may be more easily and speedily lighted. Sometimes we have only a few moments in which to act, and we must have the slack motion in each operation reduced to the minimum. The thermometers are tested at the beginning of each season for accuracy, and new ones are purchased to replace those found in error one degree or more. We have adopted the policy of purchasing only the best straight tube alcohol minimum thermometers. An inaccurate thermometer can easily cost hundreds of dollars either in fruit or oil. The thermometers are distributed in general about one thermometer to ten acres, with care being exercised to have them placed so that they truly give the temperatures of the groves. They are placed on white stakes between two trees in a spot ordinarily occupied by a heater, with the heater space left vacant, and about four feet from the ground. The white stakes make the thermometers easily located at night. The rows with the thermometers in them are also marked at the outside of the grove with white stakes, so that there is never any difficulty in locating the thermometers. When the orchards are equipped with at least a seven gallon heater to a tree we feel that our reserve oil in storage should be at least twice the heater capacity. This relatively low storage is made possible by our proximity to, and an extremely efficient service of, a neighboring refinery.

### Watch the Thermometers

As soon as the heaters are distributed in the field in the fall a night watchman is employed whose duties are to know the temperature of the groves at all times of the night. He reads thermometers during the entire night, and a record is made at the time of each reading in his record book. We have always been very fortunate in procuring young, active, conscientious men for this position, as we must necessarily repose a great deal of trust and confidence in them. The ranch is rather favorably blessed, if it can be so stated, in having one spot several degrees colder than any other section of the ranch. When this spot reaches a temperature of 29 degrees the writer is called on the telephone, and at this time, if it is deemed advisable, after learning the general condition of the night and temperatures of other groves, about four or five men are called out who are held responsible for reading thermometers and firing the heaters, each in his own particular area. These frost scouts, as they are called, are continually reading thermometers and making observations in their sections and 'phoning in immediately to headquarters. As soon as it is decided to fire any section a crew of torchmen is called. The size of this crew depends upon how fast and the extent to which we wish to fire. We figure one man will cover an acre of ground, lighting every other heater in about 15 minutes. A foreman is in charge of these men, who directs them from one section to another, taking his instructions from the different frost scouts, who in turn are continually in touch with headquarters by telephone. Quite often there are two or more crews lighting different sections at the same time. As soon as any crew has finished firing its section, and there are no other sections at that time to fire, the men fill their torches and then go to one of several firing stations, which are small galvanized iron buildings equipped with benches and stoves. If the men have been up for some time or if the night is still young, they are served with hot coffee and crackers. This hot coffee is stimulating to their morale and nerves and the men all pitch into the work with a new determination. The men all understand the necessity and importance of quick and accurate work, and upon this fact the success of our frost fighting depends.

### Quick Work Essential

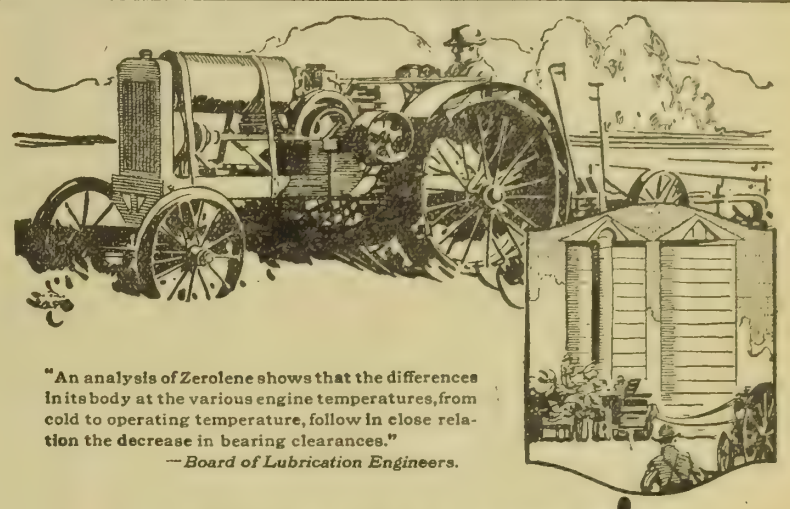
The time to begin to fire depends in a great measure upon how quickly one can fire and handle a particular situation. Whenever our heaters allow it they are wicked and the drafts all set for firing, so that all the lighters have to do is to take off the cover and drop some burning distillate in the draft hole. Although we use the thermometer in a large degree to indicate to us when to fire, still there are other factors which enter into the time of firing. We consider 28 degrees a dangerous temperature for young lemons, yet at times the temperature may drop quickly on a very dry night to a few degrees below this, and if not down too long will do no apparent damage. Then again, where the temperature has stood around 29 degrees for several hours, and particularly on a moist night, the young fruit is liable to freeze. Our experience has been that oranges under similar conditions will stand about two degrees more frost than lemons. On moist nights we watch the vegetation very closely. The malva and mustard leaves will freeze very easily and quickly and much before lemons will be injured. The dark glossy spots in the lemon leaf are the first indications that ice is beginning to form in the leaf of the tree. As soon as these spots get very pronounced, even though the temperature has never been below 29 or 30 degrees, we fire the heaters. We are very desirous to get all the ice out of our trees before the sun gets up. In following the frost game one will find that all nights are different and peculiar unto themselves. All frosty nights are not big freezes, and often these frosty nights can destroy more fruit than we sometimes fully realize. However, many times we will light our heaters and before morning a wind will come up and immediately the temperature will rise and the fires can be put out. In our section of the country we have noted that an east wind saves us from firing many times during the winter. As soon as the wind stops blowing the temperature very often drops below the danger point and it becomes necessary to fire our heaters. In making observations before firing on a dry night we take into consideration the probability of a breeze or wind coming up, and in many cases allow the temperature to remain in the danger zone for a short time. This has saved us from firing on many occasions, yet in taking these chances one must be very cautious and well acquainted with local conditions. As soon as the heaters are lighted and under way we endeavor to hold the temperature at 32 degrees. If the cold continues so that it is impossible to raise the temperature out of the danger zone with half of the heaters lit, the second half are lighted and then if still not enough heat is given out more draft is given to the heaters.

### Refill Heaters Promptly

The fires are extinguished as soon as practicable in the morning. It is generally arranged that the men go home and get breakfast while the heaters are still burning, so that if necessary to work during the daytime they can immediately begin to fill the heaters as soon as the fires are put out. The responsibility for filling the heaters, which is a very important part of the operation of frost protection, rests upon the ranch foreman. We have a rule that all heaters must be filled before coming in at night. During extensive firings this means that sometimes we do not finish filling the heaters until after dark. Extreme care must be exercised not to spill any oil on the ground. The number of wagons and men used in filling depends on the amount of oil consumed during the night, and with a little practice one can soon estimate very closely, as soon as the fires are extinguished in the morning, the amount of oil consumed during the night. One wagon and four helpers with buckets will distribute approximately 4000 gallons of oil per day, and one man will wick and regulate the drafts and clean the accumulated soot from the stacks behind one wagon. The torches are inspected and refilled and put in their proper places, and everything is in readiness for the next night's operation.

Success in frost protection consists not alone in having an adequate heater protection, but also in maintaining eternal vigilance. Care should be taken that the heaters are always filled and the equipment always ready, that there is always in storage plenty of oil for the usual emergency, and, last and most important, that someone is continually watching the weather and that available and willing help is close at hand.

(Continued on Page 119.)



"An analysis of Zerolene shows that the differences in its body at the various engine temperatures, from cold to operating temperature, follow in close relation the decrease in bearing clearances."
—*Board of Lubrication Engineers.*

**FLEXIBILITY!**
***Zerolene maintains always the right lubricating body—***

When your tractor engine "warms up" to a stiff job of plowing or belt driving, be sure there's an oil in the crankcase whose "body" will adjust itself properly to those decreasing bearing clearances caused by heat expansion.

Zerolene, being flexible, helps to keep bearings cool, and maintains always a perfect piston seal—gets more work done, with greater ease and speed.

Among other advantages Zerolene has these three:

*Stability*—the ability to resist engine heat.

*Oiliness*—the ability to cling evenly to bearing surfaces, at the same time offering in itself a minimum of internal, frictional resistance to the engine power going to the traction wheels.

*Purity*—Zerolene oils are pure. The Standard Oil Company has always considered the removal of all detrimental properties and compounds as essential in making Zerolene.

Consult the Zerolene Correct Lubrication Chart for the correct grade for your tractor, truck or automobile.

STANDARD OIL COMPANY
(California)

The Standard Oil ZEROLENE For Motor Cars

**more power & speed ~ less friction and wear ~ thru *Correct Lubrication***

**IRRIGATION PIPE**
***durable - lasting***

The same is true with all the other products we manufacture. Quality, material and skilled workmanship.

Water and Oil Casings. Tanks for all purposes. Riveted Steel Water Pipe. Galvanized Troughs.

If you paid more you could not buy better pipe. Write to us for price list, stating your requirements. We give expert advice free.

### LIVESTOCK

Los Angeles, July 25.—Weighed and delivered off cars without food or water.

Hogs (hard grain fed) 125 to 150 pounds, 10.25; 175 to 225 pounds, 10.50.

Cattle (on foot, gross weight): Steers, good, 6.50@7.00; medium, 5.25@625; cows, good, 4.75@5.25; medium, 4.00@4.50; bulls and stags, 3.00@3.50; calves, 125 to 175 pounds, 8.00@9.00; 175 to 250 pounds, 7.00@8.00.

Sheep, ewes, 4.00@5.00; lambs, 9.00@11.00.

### POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, July 25, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Demand and movement slow, market steady. New Stock: best, locals, sacked 1.15@1.40, mostly 1.25@1.35 cwt.

Onions: Demand and movement moderate, market steady. Stocktons: Reds, 1.50@1.65; Yellows, 2.00 cwt.

Garlic: Mex. best, 10@12.

### VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, July 25, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Beans: Market slightly weaker. Per lb: San Pedro: Kentucky Wonders, 3½@5; Limas, 9@10.

Bunched Vegetables: Per dozen bunches: Turnips, beets, carrots and parsnips, 35@40. Parsley and spinach, 25@30. Radishes, 20.

Cabbage: Market steady, quality ordinary. Field cr., best mostly 2.25@3.00.

Cucumbers: Local, lug, 40@60.

Celery: Movement moderate, market dull. Wide range in quality and prices; Locals, best, 5.50@6.00; poorer, 4.75@5.00.

Corn: Green, local, lug 75@1.00.

Eggplant: 6@8 lb. Coachella: local, 10@12.

Lettuce: Market slightly stronger. Locals: Ordinary, leafy, 75@1.00 crate. Northern: Fancy, 2.75@3 crate.

Okra: Lb., best, small, 6@12.

Peas: Best, Northern, lb., mostly 7@9; poorer, 5@6.

Peppers: Locals: Bells mostly 20@25 lb.; Chilis, 23@25 lb. Northern: 20 lb.

Rhubarb: Local, best, Crimson, 65@1.00; mostly, 65@75.

Squash: Market steady. Locals: Summer, lugs, 55@60; Italian, lugs, 60@65.

Tomatoes: Demand moderate, movement slow, market steady. San Pedro: Lugs best, green, 1.40@1.50; ripe around 90; poorer, 50@75.

### FRESH FRUIT

These are actual prices obtained July 25 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc., as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apples: Demand and movement moderate, market slightly weaker. New: White Astrachans, loose, 4½@5½ lb.; packed, 3½@4; tier, 2.75; 4½ tier, 2 box. 3@4; poorer, 1@2; local, lug, 75@1.00; few best high as 1.25.

Apricots: Lb., Northern Royal, best, 3@4; poorer, 1@2; local, lug, 75@85.

Blackberries: Fy., 3.50@4.00.

Cantaloupes: Turlock District: Supplies light, demand and movement good, market firm, standards best, 2@2.25; flats, 90@1.00. Locals: Market slightly weaker, Tip tops, 2.50@2.75. Persian Melons: Demand and movement good, 3 per lb.

Casabas: 2 per lb.

Cherries: Utah Bings, 17@20 per lb.

Currants: Cr. 3.00.

Figs: San Pedro blacks, large, 60@75; medium size 50 flat.

Loganberries: 2.50@2.75 per cr.

Grapes: Demand slow, market slightly weaker. Coachella: Malagas, 8@9 lb.; Black Monukkas, 12. Imperial Valley: Thompson Seedless best, 9@10 lb. Northern: Black Currants, 9.

Peaches: Per lb.: Best, 3@4. Redbirds, fancy, 1.75@2.00 lug; few high as 2.25 lug. Local Freestone, 5@7.

Pears: Market slightly weaker. Northern: Bartletts mostly 10 lb.

Plums: Per lb.: Santa Rosas, 2@4. Tragedy prunes, 5@5½.

Watermelons: Imperials, Angeleno, 1@1½ lb.; Klondike, 1½@2.

### CITRUS FRUITS

These are actual prices obtained between 7 and 8 o'clock July 25 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, 4.00@4.50; market pack, 3.00@3.75; small, 2.25@2.50.

Lemons: Demand and movement light, market firm. Special brands, fancy, 6.75@7.50; choice, 5.50@5.75.

Oranges: Demand moderate, market steady. Valencias, special brands, 9.00@10.50.

### HONEY

The nectar flow from orange has now finished, and the flow from sage is nearly over. Orange yield is reported light to fair, sage flow generally good. Fair eucalyptus flow being secured in Alameda County. Bees in Southern California said to be now gathering mostly alfalfa nectar. Beekeepers are busy extracting. Old crop practically exhausted. Demand light and market dull. Few sales reported. Carload f. o. b. usual terms: White Orange, 9@9¾, few reported quoting 8½; White Sage, 8½@8¾; Light Amber Sage, 6½@7; Light Amber Alfalfa, 5¾@6. Beeswax: Cash to beekeepers, 22@24 per lb.

### BEANS

F. o. b. Cal.:

| | |
|---|---|
| Lima, Standard | 9.00 |
| Lima, Henderson Bush | 9.15 |

Cal. Lima Bean Growers Assoc. reports some sales made in June for Oct. delivery of 1922 Limas and Baby Limas at around $6.25@6.40 f. o. b. Coast. Demand for futures now quiet. Assoc. has been sold out of 1921 crop for some time.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 18.00@23.00 |
| Barley | 16.00@20.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 16.00@20.00 |
| No. 1 Alfalfa | 15.00@17.00 |
| Standard Alfalfa | 11.00@13.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 20.00 |
| No. 1 Dairy | 15.00 |
| No. 1 Alfalfa | 12.00 |

### GRAIN

Prices L. A. Grain Exchange, July 25: Barley: 100 ton lots August Del. 1.27½.

Grain Department California Farm Bureau Exchange:

Wheat: 32 cars arrived on track Monday which supplied the immediate urgent demand which was largely due to the fear that strike conditions would stop shipments. Our market is holding right steady at around $1.90 for Sonora and $1.95 for Baart and Bunyip, subject to federal grades and discounts, in the face of a continual decline in the Chicago wheat markets. We feel that this is largely due to the influence the California Farm Bureau Exchange is having in holding steady the markets for California grain. It is, however, too much to expect that these markets can be held at present levels if the eastern market continues to decline as Utah and Idaho wheat can, within 30 days, begin to replace our California wheat at much lower prices.

Barley: This is the cheapest feed grain. The consumption is enormous. Feeders continue to buy in anticipation of their wants, fearing a shortage on account of the railroad strike. The supply has been equal to the demand in Los Angeles until the last day or two. 18 cars arrived Monday. Prices range from $1.30 for good feed barley to $1.32½ for the top grades. Smutty or light barley is bringing lower prices. The Imperial crop is about half sold. The balance is in storage and in strong hands. There doesn't seem to be any good reason to expect advances but this, of course, will depend largely upon the course of the other grain markets and the rapidity with which farmers let loose of their holdings.

Oats: Los Angeles seems bare of good oats. No immediate prices are available.

Millfeeds: Millfeeds continue high and scarce.

# San Francisco Markets

Figs, 1922, Cal. Peach and Fig Growers Assoc. prices:

Opening quotations for the 1922 crop of figs released July 24 by the San Francisco representative of the California Peach and Fig Growers' Association, show substantial advances, particularly in black Missions. This grade is quoted at 11¼ cents this year, as against an opening price of 5 cents a pound in 1921.

The complete price list for 1922 crop Blue Ribbon, dried figs follows:

Adriatic—Price 6¾; standard, 6¾; choice, 8¾; fancy, 11¾.

Calimyrna—Standard, 8¾; choice 11¾; fancy, 14¾.

Black Mission—Standard, 11¼; choice, 14½; fancy 17¼.

These prices are for figs packed in twenty-five pound boxes, ¼c per pound less for packing in fifty-pound boxes.

Adriatics, ungraded, in bags....7¼c per lb.
Adriatic fig paste, 75-lb. boxes 5½c per lb.

| | | | |
|---|---|---|---|
| 12-10 oz., bricks, Adriatics | | | $1.10 per box |
| 24- 8 oz. bricks, Adriatics | | | 1.75 per box |
| 50- 6 oz. bricks, Adriatics | | | 2.80 per box |
| 70-d oz. bricks Adriatics | | | 2.95 per box |
| 24- 8 oz. bricks, Calimyrnas | | | 2.25 per box |

For foil wrap or brick figs add 10c per box.

| Box | Row | | Inches Spread | |

California Rice Growers Assoc. reports sales last week No. 1 Paddy 2.87@3.27. Crop practically cleaned up.

### HAY AND FEEDSTUFF

A. W. Scott Co. reports under date July 22:

Receipts past week 1441 tons as compared with 1658 previous week. San Francisco market is still quiet. Receivers report oversupply of medium and lower grades; high grades are in light supply. Export and coast shipping have done a little better although cut in water freight rates has caused a rush of shipments of general merchandise which has somewhat crowded out space for the bulkier shipments of hay. Interior trading has increased slightly, a few crops of moderate size changing hands at figures quite a bit under the previous asking prices. Some farmers are placing their hay in storage; nearly all hay raisers are actively engaged in stacking and baling and not concerning themselves

as yet about the matter of marketing. The quality of the crop is better than we have seen for many years and balancing one locality with another the general average quantity seems to be about normal. Alfalfa is moving steadily but in rather light tonnage and with no really active demand. The general crop tonnage is reported a little heavier than last year. Millfeeds are higher and advancing, mainly due to the increase in the wheat market prices caused by export orders from Japan and heavier shipments.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

## Citrus Markets

Los Angeles, July 26, 1922.

Valencia market shows no drop since last week. All best grades are eagerly received at good prices.

Lemon demand is still only fair as weather continues cool in East. There are on hand for next 30 days 120,000 boxes of foreigns. This season's crop of foreigns is estimated at 30,000 carloads.

### Citrus Shipments

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 19,860 cars; lemons, 8,034; total, 27,894. To same date last season: Oranges, 32,154; lemons, 9,235; total 41,389. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total, 6,788. From Northern California to date this season: Oranges, 372; lemons, 8; total 380. To same date last season; Oranges, 305; lemons, 5; total 310.

### CALIFORNIA CATTLEMEN'S REPORT

San Francisco, July 24.—The Chicago market held steady last week although receipts increased considerably compared to the week previous. This situation makes the eastern market continue favorable for shipment east from California if necessary.

The San Francisco market remains steady with sales of cattle averaging 6½ cents to 6¼ cents f. o. b. ranch for steers and 5 to 5½ cents f. o. b. ranch for cows. The packers are willing to pay 7 cents for really choice fat steers, but they are exceedingly hard to find.

The Los Angeles market remains steady, though rather quiet. Sales are reported at 6½ cents f. o. b. ranch for steers and 300 to 400 pound calves are bringing 9¼ cents f. o. b. Los Angeles.

It is absolutely certain that buyers will not pay more than is asked for cattle. If you have good choice fat steers, you can get 7 cents f. o. b. ranch for them. There are very few of this quality in the state, however.

Government figures for June show approximately one-half the normal amount of beef in cold storage holdings, in the United States. Hides continue to increase in value, and offal is worth 12.50 per head compared with $10 per head in February and March of this year. Dressed beef is selling for about 1 or 1½ cents per pound less than at that time.

A transaction of unusual interest has just been announced from Los Angeles. A group of cattlemen have purchased the Lewis Packing Plant and organized a company to be known as the "Associated Packing Company." The purchase includes a modern well equipped packing plant, and actual slaughter of livestock by the new company began on Monday morning July 17. The company is financed entirely by producers who are well distributed over the state, some living as far north as Tehama County. A producer owned packing plant has been discussed for a long time, and this plant at Los Angeles is of great interest to cattlemen all over the state since many cattle are shipped from central and northern California to Los Angeles for slaughter.

The United States bureau of markets announces appointment of Carl V. Maloney and Nelson R. Crow, to be the livestock market reporters at San Francisco and Los Angeles, respectively. These men will begin work on August 1.—R. M. Hagen, Secretary.

### FROST PROTECTION ON RANCHO SESPE

(Continued from Page 117.)

#### Care of Equipment

After the winter season is over the care of our equipment comes in for considerable thought. The oil is pumped from the heaters and every two or three years they are moved to a central depot where they are cleaned, tested, repainted and assembled again. During the years when the heaters are not moved out of the groves the part of the heater where the paint is burnt off is repainted by hand and the heater replaced under the trees. Care must be exercised during the year not to strike these heaters with hoe or implement, as they will puncture very easily. After the cleaning operation is well organized it is rather simple. Each group of men have their own special work to do. The heater is first disassembled and the covers go to one group where they are cleaned. The sombrero hoods take a similar course of cleaning and then are painted by dipping in an asphaltum base paint. They are now drained and stacked to dry. The bowl of the heater, which is the most important part, is first drained of any surplus oil. It is then very carefully heated so that all the paint and asphaltum is melted and burned off. Care must be exercised not to overheat the iron or an injury will take place. The bowls are then scraped and brushed with wire brushes so that the metal is entirely clean of rust and dirt. They are then tested for holes by immersion in distillate, and the leaky ones set aside. The bowls and covers are now assembled and dipped in the asphaltum paint. After they are drained the bottoms of the bowls are dipped in hot asphaltum, known as petrolastic cement. This is allowed to coat the sides for about three inches. Care must be exercised not to trap any air on the bottom of the bowl. The heater is immediately placed on a square of building paper and a perfect seal made. The heaters are now dried, assembled and stacked ready to be put into the field for the next season's use. The bowls with holes in them are repaired by spot welding and are then painted similar to the good heaters.

#### Costs

The cost of cleaning and painting per heater is as follows: Labor, 10.6 cents; material, 5.6 cents; hauling heaters from field, 1.8 cents; total, 18 cents. After eight years' service we still have 13,238 of the original 13,500 heaters, or a loss of only two per cent.

The cost of firing depends naturally in a great measure on the amount of firing done. The cost of firing the Rancho Sespe for the last six years is $36.97 per acre per year. This figure includes the cost of labor, oil, care of equipment and depreciation, and all other operating expenses, but does not include interest on investment.

Our experience although short can be summed up as follows: that lemon orchard heating pays, where followed in a painstaking and persistent manner, and that it should be considered one of the main fundamental operations on any well managed lemon ranch.

### SUGGESTIONS FOR DRYING FIGS

(Continued from Page 99.)

was indefinitely postponed, pending the results of scientific investigation which began in 1908 and which has never been finally reported upon. A reasonable amount of sulphuring is considered quite legitimate in California and, when properly done, does not injure the fruit but rather improves the color and keeping qualities. Careless methods of sulphuring or attempting to make the sulphuring process cover up any shortcomings of the grower and enable him to palm off on the public an inferior article, is, of course to be condemned. The use of too much sulphur results in a large percentage of sulphurous acid in the fruit with the consequent sour and disagreeable taste.

While washing or dipping of the Adriatic figs before sulphuring is sometimes practiced, it is not at all necessary. After the figs are gathered properly, the trays containing the figs are stacked up in the sulphur house which is built of suitable size and made airtight. About one quart of sulphur will be found sufficient for each 100 small trays, if the sulphur house is tight. If wooden sulphur houses are used it may be necessary to burn two quarts of sulphur to get the necessary results. Exposure to the dense fumes until the sulphur is consumed is suggested. If not too much sulphur is used it will do no damage to leave the fruit in longer. In fact the trays of fruit are often left in the sulphur houses over night.

After sulphuring the Adriatic figs are dried in about the same manner as Calimyrna or Mission figs.

#### Sorting

Before boxing, figs should be hand sorted. Bird picked and split figs should be removed and delivered in separate boxes. Sour figs and smutted figs which can be detected, should be picked out and reserved for hog feed or other purposes. Hand sorting is most easily accomplished when the trays are not overloaded, that is, filled too deeply. Figs after sorting should not be sacked for delivery. While sacks have been sometimes used in sections where lug boxes or sweat boxes are not commonly found, the figs are more or less injured in quality by delivering in sacks or storing in sacks for any length of time. After sorting figs, they are dumped into lug boxes or sweat boxes without any further process. Sweat boxes used in the raisin and fig districts are 7½ inches deep, 2 feet wide by 3 feet, ¾ inches inside measure.

### MEANS CHEAPER ORCHARD HEATERS

It is reported that carload freight rates on orchard heaters from the Chicago territory after July 31, 1922 to main line points in Los Angeles territory will be reduced from $2.25 per hundred to $1.00 until December 31, thereby effecting a considerable saving in transportation which the distributors say will be passed on to purchasers of orchard heaters. It is doubtful if the rates will be effective after December 31 as the Transcontinental Freight Bureau has set this time limit on the reduced rates.

### GETTING READY TO FIGHT FROST

Orchardists of California will be interested in the announcement that a contract has just been made by the Geuder, Paeschke and Frey Company of Milwaukee, Wisconsin, with E. W. Dunn of Los Angeles for the manufacture of Dunn orchard heaters under the Dunn patents. This company is one of the largest manufacturers of metal products in the United States and has been engaged in this line of manufacture for more than 41 years. Mr. Phil Kempter, the factory representative, is at the Lankershim Hotel, Los Angeles, and states that the company will be in position to furnish orchard heaters in quantity for protection of orchardists against frost losses during the coming season.

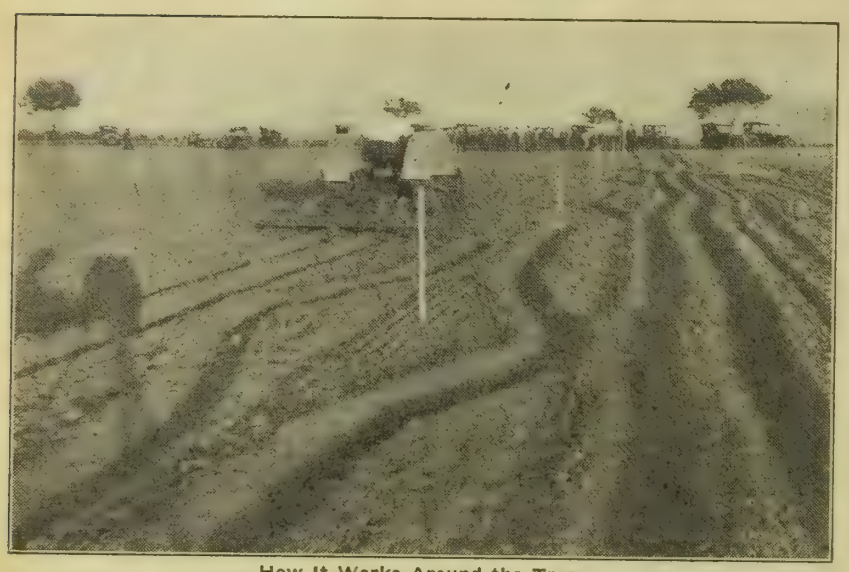
# The Wilson Automatic Furrower

## Saves Time and Reduces Cost of Irrigation Field Work

### One Man on the Tractor With a Wilson Automatic Furrower Can Prepare An Acre in Twenty Minutes

### All Cross Furrowing and Shovel Work is Eliminated and the Dry Middle Between Trees Thoroughly Furrowed

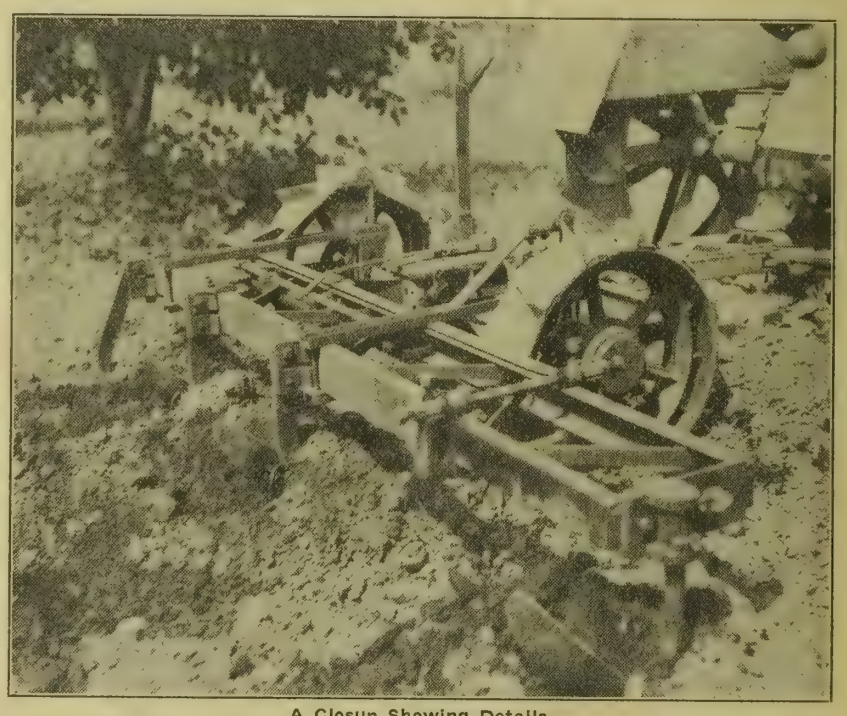


**How It Works Around the Trees**
The Wilson furrower and how the lateral as well as forward motion of the right hand plow or shovel makes impossible "dry centers."

The Wilson Automatic Furrower is the ultimate result of years of study by a practical orchardist, formerly manager of the Luther Burbank Company. This machine has been declared by expert orchardists to be perfect. It has been thoroughly tried for two years before being placed on the market. In 1921 the original machine demonstrated its value by successfully furrowing out more than eleven hundred acres. More than two hundred Wilson Automatic Furrowers were sold before one was ready for delivery. The Wilson Automatic Furrower is adaptable to use with any tractor and the tractor operator handles the tool. Drive in a straight line between the tree rows—a pull of the cord and the traveling shovel extends slowly around the tree to the dry centers between rows. In one minute it can be changed to extend the furrow any desired distance from one inch to 3 feet 6 inches, thereby thoroughly covering a 10 or 12 foot middle. The angle at which the traveling shovel extends can also be regulated to suit the desires of the owner.

### Good Bye Shovel Forever!

Think of the saving in time, money and labor. This tool does all the work usually done with shovel and hoe except cutting in at the stands. Do your furrowing, turn on the water and go to bed. The Wilson Furrowing Machine is the first and only machine to place the furrows down the dry middles between the trees. Once around the row insures equal irrigation to all parts of the orchard.



**A Closup Showing Details**
Near the center is gear case with cord attached to trip which makes possible the side motion. Right hand plow has nearly completed side thrust.

### What the Wilson Automatic Furrower Is

This implement is the most practical, efficient and economical labor saving Furrower ever constructed. It weighs 800 pounds built entirely of steel with a traveling extension shovel operated by a scientifically arranged set of gears enclosed in a dust proof housing. It is easily operated by a trip cord, and the angle of the shovel is adjustable, also the distance of the extension can be changed quickly.

The gears are all steel and every part is capable of carrying many times the load that will ever be put upon it. We guarantee the perfect working and durability of every machine sold with entire satisfaction to the buyer.

The Wilson Furrowing Machine is thoroughly financed. No stock selling campaign was necessary and it is entirely covered by Patents Pending. Warning is hereby given to possible infringers that neither time nor money will be spared in the protection of our rights, both here and in all foreign countries where applications are made. It has been passed upon favorably by all the largest Citrus Organizations and growers, and we can give you almost unlimited endorsements both as to its practicability and economy.

Located on 22 acres, Slauson and Santa Fe Avenues, Los Angeles, is situated the new One Million Dollar Plant of the Western Pipe & Steel Co. This plant is a credit, not only to Los Angeles but to the West, where they manufacture all kinds of pipe for irrigation and Tanks of every description. This is the home of the Wilson Furrowing Machine.

If you are interested, drop us a line and we will get in touch with some Tractor Agency in your territory, at once, or have our representative call upon you with a demonstration.

## A Truck That Will Do Your Work—Carry Your Loads

If there is any kind of work to which the flimsy light, or the excessively heavy trucks, are not fitted, it is the work of the farm.

Loads vary from a small lot of groceries to an overload of grain or produce or live stock.

Stamina and stability are the prime requisites.

No light vehicle made for smooth even city streets can negotiate your roads and carry your loads.

This Reo Speed Wagon was designed expressly to meet your needs.

And we Reo Folk knew just what those needs were—for a very large percentage of Reo automobiles and trucks have always gone to the country.

We had the most important feature already in service and fully proven—that wonderful four cylinder Reo motor.

That's the greatest motor ever built. Rugged—built for hard work—all working parts 50 per cent over-size.

Here is a motor whose records no other has ever approached.

More than 500,000 miles is the record so far of one of the first Reo Speed Wagons.

Now nearly eight years in service—and doing the same work daily it has always done.

That is the kind of truck you need on the farm—chassis, transmission, clutch, axles and other units, on a par with that matchless motor.

For all loads ranging from a quarter-ton to a ton-and-a-quarter.

Hauling over all manner of roads—city pavements, macadam, dirt roads—and trails.

At times you must over-load cruelly—alright:

In all such conditions the Speed Wagon will do your work quicker and cheaper.

# The Kadota Fig

## By Ira J. Condit, Horticulturist in Charge of Fig Investigations, California Peach and Fig Growers

DURING the past few years considerable interest has been aroused throughout the San Joaquin Valley in the commercial possibilities of the so-called Kadota fig. I have already written so much about the variety that I hesitate to add any more to its literature. In discussing, however, the California fig varieties which are being grown commercially, we must not overlook the growing importance of this new aspirant for horticultural honors.

### Characteristics

The Kadota is a rank grower when given an abundance of water. A Calimyrna, Adriatic or Mission tree will practically make as much growth if grown under the same conditions of soil and moisture. The important fact, of course, to consider is the amount and quality of fruit produced. The Kadota fruit is benefited by an abundance of moisture since it is increased in size and amount. The Calimyrna and Adriatic fruits are susceptible to splitting and souring, therefore overwatering must be avoided. Since the two last mentioned varieties are grown primarily at present for dried fruit, it seems to be the best practice to avoid overirrigation during the early life of the tree so that deep rooting will be encouraged. Continued frequent irrigations of the Kadota are practiced to encourage rank growth of the tree and heavy production of fresh fruit. In exposed situations this heavy rank growth is liable to frost damage and growers in such localities may have difficulty in bringing a tree to profitable production on account of winter injury.

### Caprification

Caprification affects the fruit of the Kadota more noticeably than most other common figs. The differences may be noted as follows: The color of the uncaprified fig is a light, lemon yelow, the surface somewhat glossy; of the caprified fig, the color is green or yellowish green and the surface dull. Ribs on uncaprified figs practically absent; on caprified fruit ribbed appearance marked, especially in the wilted specimens. Meat or rind seemingly little affected in thickness and texture. Color of flesh in uncaprified figs amber or pinkish amber to light strawberry; in caprified specimens much deeper. Uncaprified figs, practically seedless, at least seeds small and hardly noticeable; caprified figs with numerous large, fertile seeds. Flavor of caprified figs sweeter and richer.

The value of caprification of the Kadota figs depends upon the ultimate use of the fruit. The fresh fruit shipping quality is somewhat impaired. For drying the caprified figs are much superior to the uncaprified although the skin is still thick and tough. For preserving the uncaprified figs are much more desirable because they are better in appearance, in size and in canning quality. Most growers prefer the uncaprified fruit and avoid caprification if possible.

### Adaptations

On account of the resistance of the Kadota fruit to unfavorable moisture conditions which cause most other figs to split or sour the variety may be planted over a much wider territory than either the Calimyrna or the Adriatic. It is too much, however, to claim that the fruit never splits or sours. I have found sour Kadota figs in three localities and in one case caprified Kadotas were found splitting more or less commonly. Successful young orchards are found on both heavy and light soils. While good dried figs may be produced without the application of any water to land except the natural rainfall, an abundant and uniform supply should be assured throughout the season for the best results with Kadotas. Commercial results so far secured in preserving and canning the fruit seem to show that the Kadota is unexcelled for such purposes.

Immature Kadota figs are more susceptible to heat damage than figs of other common varieties. When summer temperatures range around 105 degrees Fahrenheit or above, the small figs, from a quarter to one-half inch in diameter, seem to be affected so seriously that they wilt and shrivel up. This injury is probably due to the excessive exaporation of moisture from the leaf surface which reduces the water content of the fruit beyond the point of recovery. An ample supply of soil moisture and the growing of summer cover crops should reduce the damage or overcome it entirely.

Another surprising fact regarding the Kadota is the susceptibility of the trees and fruit to the attacks of red spider. Occasionally the Adriatic fig suffers from the ravages of this pest, but in the past most varieties of figs have been considered to be immune or nearly so. The experiences of the past two or three years, however, have shown that Kadota leaves are very well relished by the red spider and that the developing fruit becomes rusty and unfit for preserving unless the infestation is checked by means of sulphur applications.

One thing which intending planters of Kadota figs should consider is the labor problem. From July to October or later there is or should be a steady succession of crop which must be picked in right condition for best results. Steady, reliable pickers must be on hand to keep the fruit picked clean, for, as already stated, the dried product cannot be relied upon for much revenue.

# The Peach Pickers Art

## By H. A. Brandt

PEACH picking is one of those seemingly simple operations that has in it all the possibilities and compensations of an art. The amateur peach picker is inclined to feel of the largest and most highly colored peaches in his effort to get the peach of his dreams. This is a rule of thumb method that has its advantages in the discovery of the first ripe fruits but it is not a method adapted to the handling of peaches when picking is in full blast.

Perhaps first among the factors to be considered in peach picking as an art is the use to which the fruit is to be put. A peach that has attained to a state of soft ripeness is in prime condition to eat immediately out of hand. Such a peach will not stand a trip to the cannery, and much less the trip to Chicago or New York. Thus it is obvious that the use to which peaches are to be put is an important consideration in determining the particular stage in the ripening process at which the fruit should be picked in order to conserve the utmost in texture and flavor. The suggestions that are to be set down here are those that seem of value at the opening of the writer's tenth season in the fine art of peach growing. They are suggestions that are primarily applicable to the situation where the orchard and the cannery are not many miles apart. This paper is not to be a discussion, at least not primarily, of the problem where the fruit must be shipped a distance or marketed as green fruit.

### Picking for the Cannery

In picking peaches for the local cannery the principal factors in judging prime ripeness are color, shape and response to the touch. The peach picker who is an artist at the work does not judge ripeness by softness, but rather by those subtler qualities that obviate damage to the texture of fruit. For example, in the picking of yellow peaches like the Lovell, if the fruit is grown on sandy soil and therefore free from dust, the picker will judge first by color and shape. Color is a variable factor, and here is one place that the art of picking comes into play. Color varies, or is dependent on position and exposure. Peaches in the shade are never so highly colored as those that grow in the sun. The picker will make allowance for this, fully realizing that the pale yellow peaches in the shade may be riper than the gorgeous fruit in exposed positions. Next to the color factor in judging prime ripeness is the shape of the peach. Well rounded plump fruit is mature fruit. It may not be at the exact stage of ripeness that the picker desires, and yet every well shaped peach that is yellow and plump will bear the next test. The third factor in judging prime ripeness is response to the touch. What does the yellow rounded peach do when the picker takes it lightly in his fingers? Does it respond to the touch? If it sticks, leave it. If it comes off easily and clean from the stem in response to a gentle pull the peach is ready to pick for the local cannery. This may not be an infallible rule, but when the picking of the crop is in full swing it is a quick and reasonably certain test of prime ripeness.

### Delivering in Prime Condition

The art of picking peaches includes the delivery of the fruit to the cannery in prime condition. It is therefore evident that a peach must not only be picked at the right time, but that it must be handled with care. There is a large opportunity for improvement in the handling of peaches. There are two factors of importance in this part of the process. These are the actual care in handling and the time element. In the handling it is not only important to refrain from crushing the delicate flesh of the fruit between the thumb and fingers in the effort to judge prime ripeness, but it is even more important to get the fruit to the cannery with as few bumps and bruises as possible. In all of this the time element is important, because in spite of the best practice some bumping and bruising is bound to occur. The evil results of unavoidable bruising may be minimized by getting the fruit to the cannery as quickly as possible after picking. Peaches that have stood over night in the field always look like they had spent a bad night. As for picking containers it is no doubt obvious that something rigid that minimizes bruising is the correct practice. The writer once experimented with a canvas picking sack for a few minutes. The results were disastrous. Peaches cannot stand the constant shifting and pressure of the sack method. The best picker's container should be so constructed as to minimize the bruising of the fruit.

### Three or Four Pickings at Least

It is obvious from the foregoing that a crop of peaches can not all be picked in a once over. Three or four pickings are the least good practice will allow. Frequent picking may seem on first thought to entail additional expense. This is true in one sense, but in another sense it is not. The cost of frequent pickings is more than balanced by the better condition and consequent higher grade of the fruit, by a somewhat higher yield, and by the superior condition of the tree after the crop is harvested. The first of these three considerations is obvious, but the last two may not be so at first glance. The superior yield is especially noticeable where trees are overfull and sizing the fruit with difficulty. In such cases picking for sizes tends to relieve the tree, releasing vital energy for the maturing of the greener and smaller fruit that remains. Thus frequent pickings may furnish just the relief necessary to bring the fruit up to size and better paying grades. Again, frequent pickings tend to leave the tree in a better

(Continued on Page 143)

# Agricultural News Notes of the Pacific Coast

## Northern California

Colusa County will feature rice in its exhibit at the state fair at Sacramento.

A total of 1105 carloads of eggs was shipped East from California during 1921.

Fires on the north slopes of Mt. Diablo have done serious damage to many ranches.

Hop growers in Sonoma County say hops have made good growth and are of excellent color.

Word comes from Sebastopol, Sonoma County, that the walnut crop is in splendid condition.

Calaveras County has been divided into districts for systematic campaign against ground squirrels.

Sutter County is making plans for its third annual peach contest. Already 100 peach orchards have been entered.

Glenn County is divided into 18 local fire units all connected by telephone service so that quick action is possible.

Secretary Wing of the California Wool Growers' Association is planning installation of an exhibit at the state fair.

It is expected that pear shipping from Nevada County will start about the middle of August. The fruit is late in maturing.

The directors of the Sonoma County egg laying contest are drawing up plans for improving the contest headquarters at Petaluma.

Stockmen of Nevada County are talking of holding a big stock sale at Grass Valley this fall under direction of the farm bureau.

The Chico chamber of commerce is urging farmers of the vicinity to get together in working for the formation of Chico irrigation district.

Pastures and ranges are drying up in the section about Fort Bragg, Mendocino County, but there is plenty of dry grass and stock are in good condition.

A field laboratory for the study of disease affecting range cattle in Siskiyou County has been established at Etna Mills by the division of veterinary science of the state university.

Red Bluff, Tehama County: There seems to be plenty of green feed on the higher ranges. Tomatoes and cucumbers plentiful. Peaches should be ripe in about two weeks; indications are for good crop.

At a recent road meeting held at Wilson of representatives from Sacramento and Sutter Counties it was decided to take joint action in putting through a paved highway from Yuba City to Sacramento.

Ranchers of the Alameda County water district have filed suit against the East Bay Water Company to restrain it from further operation of its deep wells at Niles. The plaintiffs allege that the water table has been lowered to the detriment of their crops.

During the first six months of 1922 the United States mint at San Francisco and local smelters anad refiners received from the mines of California $7,721,258 in gold, $371,140 more than during the first six months of 1921, when the receipts were $482,000 less than in the first six months of 1920.

## Central California

San Joaquin Valley orchardists report prunes dropping heavily.

Many Tulare Lake growers are said to be holding out for $2 for their wheat.

Six carloads of Thompson Seedless grapes were shipped from Kern County last week.

Fumigation for control of citricola scale is being carried on in the Lindsay district of Tulare County.

The Spreckels ranch at Aptos, Santa Cruz County, has been sold to a syndicate which will subdivide.

Tulare County reports Thompson Seedless slow in maturing. Shipments will start about the first of August.

Work is being rushed on the Don Pedro dam and engineers say it will be completed, as planned, by next May.

The California Peach and Fig Growers are operating three fig canneries this season, at Turlock, Fresno and Dinuba.

The Stanislaus County Peach Growers contest, under direction of the county farm bureau, already has 33 growers signed up.

Packers are reported paying seven and even seven and one-fourth cents for white Adriatic figs of selected stocks, f. o. b. the packing houses.

Independence, Inyo County, reports corn and alfalfa better than usual. Plenty of water and the last three weeks of warm weather tend to make all crops good.

The California Prune and Apricot Growers Association estimates this year's dried apricot tonnage somewhat less than last year's which was 25,000,000 pounds.

An apple butter plant is soon to be established in Watsonville. A building has been leased for five years and installation of machinery will begin in about 30 days.

A new confection has made its appearance—glazed olives. The olives are pitted and glazed with candy coating and are being put out by a Lindsay packing plant.

Apprehension as to the railroad strike situation has caused peach growers to hunt up drying trays so that if necessary the freestones may be dried instead of shipped fresh.

Fresno County's first annual Pork Day will be held at Kearney Park, under the auspices of the Fresno County farm bureau, October 20, 1922. Prizes offered aggregate $1211.50.

Kern County members of the grain department of the farm bureau exchange expect to ship 25 carloads of barley and wheat. They will handle a much larger crop of milo.

There is talk of building a road from Florence Lake through Piute Pass to connect with the road from Bishop to the summit. This would give connection between the San Joaquin and Owens River Valleys.

Six hundred head of hogs, the largest shipment on record consigned to Honolulu, left Tulare July 24 for San Francisco where they will be loaded aboard ship for the Hawaiian Islands. The hogs were shipped by Kendrick & Baldridge of Tulare to Hold & Locey of Honolulu.

## Southern California

The Hemet Valley estimates its apricot crop at 10,000 tons.

The peach canning season opens at Hemet, August 8 for a ten weeks' run.

A total of 1650 tons of apricots will be packed by two canneries at Pomona.

The Anaheim district of Orange County expects to harvest one of the largest walnut crops in its history.

Permanent site for the Valencia orange show has been purchased by the Anaheim chamber of commerce.

Lima beans in Santa Barbara County are somewhat spotted as a result of unfavorable weather in the planting season.

Escondido, San Diego County, sent out four carloads of cattle on Tuesday of last week.

Cotton is in excellent condition in Imperial County, putting on squares in fine shape.

A dairy survey is being made of Riverside County through the office of the county agent.

Westmoreland Imperial County, has shipped 250 carloads of watermelons this season and 1350 carloads of cantaloupes.

San Pasqual Valley in San Diego County, reports the largest apricot crop in many years. Drying is about finished.

It is planned that part of the waters from the great Warners dam in San Diego County will be available by January.

The new date packing house at Indio will be finished in time for the coming crop. The plant will be provided with two maturation rooms.

A vacuum fumigator for treatment of nursery stock has been installed on the property of the Lemon Heights Nursery Company at Tustin.

A market reporting service for livestock will be instituted at San Francisco and Los Angeles by the U. S. department of agriculture.

Special meeting for poultrymen of Southern California at Pomona, August 4, to be held under direction of the Los Angeles County farm bureau.

The Riverside cannery of the California Growers closed its run on apricots, having handled over 600 tons. This cannery will handle 4000 tons of peaches.

Thousands of sheep are being moved from the Antelope Valley of Los Angeles County through the Tehachapi to grazing lands in the foothills near Bakersfield.

A reduced freight schedule between Imperial Valley points and Los Angeles has been ordered by the state railroad commission. The new rates will be applicable both ways.

An almond warehouse is nearing completion at Paso Robles, San Luis Obispo County. This is said to be the largest almond warehouse in the state outside of the big central plant of the state exchange at Sacramento.

Irrigating companies of Azusa, Duarte and Glendora have collected 300 cast off smudge pots and presented them to Supervisor Charlton of the Angeles reserve to be used by campers for cook stoves. This in endeavor to lessen menace of forest fires.

## The Coast and General

Orchardists in Oregon are finding some difficulty in securing sufficient labor.

Extensive plantings of dates are being made in the Salt River Valley of Arizona.

Pure bred dairy cattle and milk goats from America are being introduced in South China.

Condition of wheat in Oregon is the poorest in years, considerable areas not being worth cutting.

Lightning has caused an unusually large number of fires in the Tonto national forest in Arizona.

The Lower Columbia Dairymens Association (cooperative) is handling the cream of 400 shippers.

Alfalfa seed growers in the Yuma district of Arizona report dry weather favorable and yield running fair.

The Oregon Dairy Council will take charge of the dairy exhibit at the Pacific International Stock Show this winter.

Cantaloupe shipping is over from Arizona except for Honey Dews. Melons came on oversupplied market in the East.

Work has started on the diversion dam across the Gila River at Sacaton, Arizona. $600,000 is being expended on the work.

Dairymen of Pima County, Arizona, have organized a marketing association with W. A. Knapp of Jaynes Station president.

Thousands of live quail are being shipped from the Nuevo Leon and Coahuila districts of Mexico. The quail are caught in nets.

Growers of seed potatoes in Western Washington and Eastern Idaho are making plans for their second annual show this fall at Spokane.

Trial shipments have been made from Brazil to New York of several hundred cases of oranges, tangerines, pineapples and avocados.

The Alaska salmon catch will exceed that of last year by 50 per cent. Canning is still in progress at Bristol Bay and in southern Alaska.

Ranges and pastures have improved east of the Rocky Mountains, but are generally poor in and west of these mountains, the deterioration in Washington and Oregon being considerable.

The sweet potato crop is excellent in the southeast and generally good elsewhere, although late in Mississippi and Arkansas. The commercial crop is being harvested in Florida and Alabama.

Report of the Tempe, Arizona Cow Testing Association for June shows average for the 430 cows tested of 27.8 pounds fat. The highest testing cow was a grade Holstein which gave 63.5 pounds fat.

Wheat is being threshed in Virginia, the Ohio Valley, Iowa, Nebraska and California. Some excellent yields are reported, but the out-turn is usually less than the quantity expected and the quality is rather low in places.

Arizona sent its first carlot shipment of Thompson Seedless grapes to Eastern markets last week. Packing is now in full swing. Midseason peaches and plums are ripening, while tomatoes are at their peak of production.

# "Hydro" As Is in Ontario, Canada

By C. B. Messenger

THE world is looking to California for information as to cooperative fruit marketing. It is asking how we have done it and how others with other products to market and other conditions to meet may apply the principles and secure the success given to California. Even as I write these words here in the beautiful little city of Hamilton, Ontario, at the extreme western tip of Lake Ontario, Aaron Sapiro of San Francisco is here inspiring Canadians as he has Californians. The fruit growers of Ontario, especially those of that wonderfully productive strip of land along the northern shores of Lakes Erie and Ontario, are already cooperating and erecting cooperative canneries to handle the fruit which the market interests have heretofore dumped into the lake—when occasion seemed to make that procedure profitable to them. Yet the growers need more and a higher community spirit in order to more completely cooperate. Hence Mr. Sapiro is here.

Yet in one line of cooperative effort or community work the Canadians are leading the world. They are harnessing the God-given waters of Niagara and turning the flood into blessings.

"But are they?" "That may depend on the point of view."

Possibly. However, I know of no more important point of view than that of the fellow who is getting the advantage of the development and paying the bills. So I have stolen a few busy days from an already long trip and taken a little side diversion by stopping off at Buffalo, thence down to Lewiston, taking a short boat ride across the head of Lake Ontario to Toronto, visiting the Commission, also consumers, in Toronto, then breaking away into the rural districts and learning at first hand as to the use made of "Hydro" by those who have not heretofore had the advantage of electric light or power. I have likewise talked with some who are not using it, and asked why. It has all been wonderfully interesting and will, I believe, furnish a few short stories of "Hydro" as it is in Ontario.

But stories of "Hydro" will mean little till a bit of explanation is given. The official title of the commission which has to do with hydro-electric development in Ontario is "Hydro Electric Power Commission of Ontario," which is too much of a mouthful for a busy Canadian, so it's all cut down to the five letters. Again, in asking a farmer as to whether he is using electricity for lighting and power as supplied by the commission, he invariably replies: "O, yes, I use (or sometimes do not) Hydro."

Again the word is sometimes used with an exclamation mark, for, frankly, there are those in the Province of Ontario who are intensely opposed to state management of hydro-electric power. When asked as to their opinion these people usually reply: "Oh Hydro!" The one inquired of sometimes explodes with the "Hydro" in such a way that it sounds as if he were wishing it were spelled Hydra and that the pleasure of cutting off each of the nine heads might be his. If this privilege were granted him I doubt not each head would reproduce two and possibly more, and hydro-electric development thereby be increased. I had more than an hour's interview with one of the most bitter opponents of the commission. He is attorney for the "U. F. O." U. F. O. means United Farmers of Ontario, but I soon learned this, that in representing the United Farmers as attorney he was not representing them in the matter of hydro-electric development. But a few paragraphs from his story will be given another day.

I will endeavor to give the people's own expression and show so far as possible their own viewpoint. I wish first of all to express appreciation for valuable aid given by Hon. R. T. Jeffrey, by J. W. Purcell, assistant engineer in charge of the engineering problems of rural districts, His Worship C. Alfred Maguire, Esq., Mayor of Toronto, Mr. Miller of the Toronto Telegram, A. A. McLaren, Mr. Waldron of the U. F. O. and to many others, officials in the province and farmers and other consumers.

* * *

### Peculiar, But Real Cooperators

In the long long ago, somewhere in Europe, there gathered together a number of people somewhat peculiar in their religious beliefs, and there they laid the foundation for a religious organization which, while not large, has continued to this day. Its branches exist in nearly all parts of the world. One of the fundamentals of their belief as to dealing with each other is that brotherly cooperation leads to the upbuilding of the entire community and the greatest success and best opportunity for advancing God's kingdom here on earth. Those belonging to that organization have since become known as Mennonites. They are not the originators of the cooperative idea, but they have been factors in its advancement. To give an example of the extent to which they carry the cooperative idea I may say that they never carry any insurance, trusting to the wisdom of God and to the cooperative spirit of the people who are neighbors. If the house or the barn should burn the neighbors, without previous agreement and purely voluntarily, contribute a sum sufficient to cover the construction of a new building to replace the old. This is possibly hardly equivalent to cooperative mutual fire insurance organizations of California, but the protection is there and the cooperative spirit has been encouraged.

### Not Berlin Any More

Amongst other places in which these people settled is a community the center of which is known as Kitchener, in the Province of Ontario, Canada. Lest some readers of the Cultivator get down the old atlas to look up the location of Kitchener, let me suggest that a recently made map will be required to locate the town. However, if the possessor of the older map will locate "Berlin" in the county of Waterloo, Province of Ontario, some 30 miles west of Hamilton, he will find "Kitchener." Kitchener was Berlin since its founding until the recent World War. The settlement was made by Mennonites and others of German origin. They and the younger generation learned to love their adopted flag, and most of them were intensely loyal people. The World War changed opinions and the change in the name of the city was suggested. Naturally there was much opposition. The fight waxed hot but ultimately resulted in a change from Berlin to the thoroughly English name of Kitchener.

This bit of a story may have little to do with hydro-electric power. It does, however, have much to do with the cooperative spirit of the people of Ontario. It has made possible the putting into operation of the greatest hydro-electric power concern in the world. It is a concern which has already spent in excess of two hundred millions of dollars in installation work, has supplied a couple of hundred cities and communities with electricity and has added to the comforts and livableness of rural communities, many of which were entirely without till hydro came.

### But They Are Cooperators

One of the principles also approved by the religious sect to which I have referred is: "There shall be no pampering or allowing of members to indulge in luxuries." Many of these people to this day deny themselves and their children the right to ride in an automobile, to adorn themselves with jewels, or even to provide the simpler comforts, or what many of us consider necessities in the home. Yet with these two sentiments opposed to each other, the community, or cooperative spirit triumphed. More than a score of years ago some two or three gathered in the home of one and discussed the matter of the awful waste of power and the comforts which it would give if a harness were put on the waters of Niagara, a hundred miles away. This informal conference resulted in others, and still others, until ultimately the Provincial Government was approached with a suggestion that the problem was altogether too big for any one community to handle. The campaign was one of education, then of agitation and finally of accomplishment.

### A Big Job for a Little Country

The Province of Ontario covers 260,862 square miles, and has a population, or rather had in 1901, of 2,182,947. Considerably larger in territory, but smaller in population, than California. The harnessing of the Niagara seemed too big an effort to many of the people. Opposition was fierce. To make a long story short, cooperation prevailed, and today there are electric installations in the homes in many parts of the province. The installations are under the direction of 14 "systems." These systems are required to handle power and lights as generated from different centers. Of course the one greatest of all, greater than all, is the "Niagara System." Then there are the Central Ontario, Essex County, the Eugenia, Muskoka, Nipissing, Ottawa, Rideau, Severn, St. Lawrence, Thorold, Thunder Bay and Wasdell systems. The smallest of these is the Thorold system, which serves a population of only 5,514 and secures its power from a small waterfall.

Al of these systems are under the direction of the Hydro-Electric Power Commission of the Province of Ontario. This commission consists of three members, viz., Col. Sir Adam Beck, chairman; Honorable D. Carmichael, and Honorable J. B. Lucas.

### Rural Installation

Without touching upon the steps by which this great movement has grown, let me refer for a moment to the pro-

(Continued on Page 128)

# This Month in the Ornamental Garden

## Southern California

By Ernest Braunton

AUGUST is the month when the cautious gardener begins to "nibble at the bait." Some of the most experienced sow cineraria seed; some wait until September. The time is sometimes dictated by the weather. Directions for sowing and care are printed on the seed packets, but remember that cinerarias are cool weather plants and must also be grown in the shade. They require a damp soil and should be well fed when vigorously growing, preferably with liquid manure.

California poppies may be sown any month in the year but the list of seeds for August is about one-tenth the length of that for September, so better bide a wee. If good care will be given one may plant seeds of hardy perennials, coreopsis, dianthus, delphinium, foxglove and hollyhock. During the past month hollyhocks have come from seeds in the writer's garden as a volunteer crop, so they certainly may be started now. It must be the natural time. Some plant sweetpeas and pansies late this month, also snapdragons and stocks.

August is often a vacation month, but neglect of gardens should be avoided for the need of water particularly is great, and plants quickly show lack of it while weather is so hot and dry. If this one supply is given, however, the garden will otherwise endure neglect without serious harm. But lack of care often results in injury from insect pests so that periodic patrol is advised. While hot and dry for seeds plants of the following may be set out if the soil is a loose one, retentive of moisture and the water supply is sufficient: calendula, candytuft, carnation, centaurea, coreopsis, cosmideum, cosmos, daisy, digitalis (foxglove), gaillardia, marigold, phlox, petunia, salpiglossis and scabiosa.

If roses have been set out for one or more years do not water until some time in September—later if bushes are old and large. Do not hold water from plants set out last spring, but still cut it down some and allow a rest. They will respond better with a fall crop. Quite to the contrary, water chrysanthemums heavily—they can hardly have too much. Also feed them well; they are now gathering strength for the supreme effort. Until the buds show color, feed heavily. Then stop, but still continue flooding until blossoms are picked or faded. If dahlia bulbs are available and planted now the flower crop will be just as satisfactory as that of spring. Some growers cut down stalks in July or August, after spring crop of flowers, water and fertilize heavily and secure a splendid show of autumn flowers.

## Northern California

By A. R. Gould

THE garden should still be well supplied with bloom of zinnias, asters, dahlias, cosmos, marigolds, hardy asters, ageratum, godetia and stocks, and these, with a few other subjects coming on in the perennial border, will last for some weeks yet. Chrysanthemums will be making strong growth and a watering of liquid manure will be very helpful once or twice weekly. Where the plants are grown for large blooms they will need some muslin cover for protection from the sun. The clumps of the bush plants should be thinned out to about three shoots. Spray with black leaf 40 for aphis which usually gives trouble. The chrysanthemums will need stakes for support. Tie up all climbing plants and mulch with manure.

### Begonias

These will require feeding with liquid manure.

### Roses

The rose beds will need some attention and should be dug and mulched with manure while the bushes if pruned back now will provide a fine display for the fall.

### Perennial Border

This should be looking gay with many of the summer flowering subjects, some of which will require staking. Dead blooms from the iris and foxgloves should be removed.

Seeds for the following may be sown now for the future supply of bloom:

### Winter Flowering Sweetpeas

Of these there are numberless varieties. These if sown now will give all the winter bloom required but the soil must be well prepared and trenches deeply dug if large blooms are desired.

### Other Useful Subjects

Sow these on a warm border or in boxes: Forget-me-not, cineraria, violet, pansies, snapdragon, clarkia, dianthus, Sweet William, Canterbury, bells stock, alyssum, silene, eschscholtzia and primula in variety of the hardy types. These will provide a successional display for many months, but no time should be lost in sowing the seed, and the seed beds or boxes must be well prepared with fine soil

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

☞ If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

### THIS WEEK'S COVER

One of the units of the Queenston plant of the Ontario hydro-electric system. When completed there will be nine of these units, each with capacity for 45,000 k. w. h. or 55,000 horsepower.

The water in the penstock has 305 feet fall and a pressure of 190 pounds per square inch. The rotar, or revolving part, weighs 500,000 pounds (lest the proofreader thinks that's a mistake, it may be added that it is a half million pounds), and that half million pounds is revolved at the rate of 187½ revolutions per minute. There are two 150 ton cranes in the plant and two are required to lift the rotar. It is 71 feet from bottom to top of the generator. The structure is 178 feet high. The voltage at generator is 12,000 but is immediately "stepped up" in transformer to 110,000 volts for long distance transmission. These generators are part of them from the shops of the Westinghouse Company and the others from the General Electric.

### DANGEROUS PESTS

The weekly news letter of July 29, issued by the state department of agriculture, contains the following statement which shows the constant danger that confronts the California fruit growers from importation of infested fruit and vegetables. Those interested in fruit and vegetable production in this state should lend every assistance possible to Director Hecke in his efforts to keep the melons and other fruit flies from gaining admittance.

"With the knowledge that should the melon fly or fruit fly of Hawaii or the fruit flies of Mexico become accidentally established in California the great fruit producing and shipping industry would suffer appalling if not complete loss, no effort should be spared to protect the state from invasion, especially through its maritime ports. At present in Hawaii the marketing of melons, cucurbits and all fruits, except pineapples and bananas, is prohibited because of the destructive work of the melon fly and the Mediterranean fruit fly. The only exceptions are in the case of Chinese gardeners who "bag" the individual fruits and melons and thus protect them, and who demand correspondingly exorbitant prices for their products. Like Hawaii, California has an abundance of host fruits in which both melon and fruit flies would propagate the year round.

"During the period, July 1-17, the bureau of plant quarantine at San Francisco intercepted the melon fly. Bactrocera cucurbitae in a lot of five boxes of tomatoes from Honolulu and the Mexican fruit fly, Anastrepha ludens in one lot of mangoes found in the stores of an English steamer. An interception of the sweet potato weevil, Cylas formicarius was made in sweet potatoes found in passenger's baggage coming over from Papeete. Many other interceptions of contraband horticultural shipments were destroyed."

### CALIFORNIA FRUIT

California has the soil, water and climate in the forms necessary to grow all of the different varieties of fruit from tropical to the most hardy, and with these natural advantages there is no reason why we cannot make her the fruit supply source of North America.

We are continually hearing the cry of "over production," and no doubt this keeps many of the more timid ones from engaging in the fruit business. Perhaps this is as it should be for no one should engage in that business (or any other for that matter) unless he has enough faith in the undertaking to, if necessary, give it all the energy, thought, and financial assistance at his command, ever looking forward with confidence in the ultimate outcome and pausing only long enough to use each failure as a stepping stone to attain ultimate success.

We well remember how dismal the future of the citrus industry looked some 35 years ago when it seemed impossible to get anything but red ink returns on citrus shipments and the cry went up that we had too many oranges. Today we are shipping carloads where we were shipping boxes at that time, and they are all consumed at prices remunerative to the producer. People are learning the value of fruit as a diet and each year the consumption of fresh fruit per capita increases. A well known fruit shipper advised the writer some years ago that a certain eastern town where he used to ship ten boxes of oranges per week was now taking three carloads per week. This just shows the normal increase in the consumption of oranges in one town in about 30 years' time.

We presume that this holds true in the case of all other fresh fruits, and we believe with Mr. Bergtholdt that there will be a market for all the fruit that can be raised on every available acre of suitable fruit land in California. This, of course, provided those varieties are planted that are best suited to the soil and climatic conditions of the locality. Also provided the growers of California continue to strive to maintain our reputation for supplying good fruit, well packed and delivered in an attractive condition.

Let all Californians stand together for better orchards, more prolific production, and higher quality of fruit, and the demand will surely come for all the good fruit we can supply.

### AFIELD

They're wonderfully mixed up as to their time in many places. They have all the time there is, but the arranging of it to suit every one and their understanding what the other fellow understands is most embarrassing. I have lost out on important events on this trip because of the exasperating changes in time.

Take the case of Cleveland and of many small towns nearby. It is a section which was formerly on the eastern edge of the central zone where "central" time prevails so far as railroad operation is concerned. Being on the edge of the zone the "sun time" proved to be about 30 minutes faster than the railroad or standard time. Some refused to program for their clocks were as correct as the sun and should stay with it. War time regulations with national daylight saving program and the loyalty of the people saved the day for a time and harmony prevailed. Later some of the roads operating out of Cleveland changed from central to eastern time, which is one hour faster than central. Some roads running west retained the central.

Practically all the cities from Chicago east are pushing the clocks ahead one hour on the regular daylight saving schedule. Practically all small towns and all rural communities are not programing.

So here you are: 12 noon, central time; 12:30, more or less, sun time; 1 o'clock, eastern standard; 2 o'clock, daylight saving.

It creates a situation which in connection with this humid heat leads to anything but "goose flesh," believe me!

In southern Ontario and northern New York I have seen more liberal use of tractors in haying operations than farther west. Seems to be quite a common practice to hitch the smaller type tractor to a wagon, to which is attached the loader, and the whole operation of raking and loading is completed. This requires two loaders and one driver of the machine.

By the banks of the Genesee River I noted several of the old time grist mills and, from all appearances, some of them at least were still in operation.

The Mohawk and other valleys below provide one of the greatest milk supplies for the city of New York. The black and whites prevail, although Guernseys show a liberal sprinkling, with occasional herds of Jersey markings.

At Syracuse a cluster of buildings covering many acres, plainly indicated it was a fair ground, and soon in passing what was apparently the principal entrance, there was a great sign noting the beginning of the New York state fair on September 11. Syracuse also appeals for attention to its merits by erecting great bulletin boards along the railroad, stating: "This is Syracuse which has the lowest of electric power rates." Lower power and light cost is the material factor in the advancement of any community.

The roadway running parallel to the railroad, or as it is known, "the New York State Turnpike," is a remarkably fine road and appeared to be fully equal to California's best, but in no section have I seen average roads which in any way equalled those of California.

I have long heard of the beauty of the Berkshire Hills, but never imagined it until we pulled out from Albany and, after crossing the Hudson, began to climb up to Pittsfield and other beautiful little cities nestling in most picturesque hills which are covered with the "forest primeval." I understand these hills are filled with summer homes of millionaires, but still believe there is plenty of opportunity for delightful summer homes for the millions who can not come and enjoy the breezes of the Pacific.

At Boston I experienced a most delightful two hours in a trip through the vacuum fumigation plant of the federal horticultural board. Boston is the port of the greatest importation of cotton in the United States. Doubtless this is because of the many cotton mills located in the New England states. I am also to take a trip through a similar fumigation plant in New York, and will speak of that, also of this Boston plant more fully in another letter. The office Kodak was also busy and will have some interesting photos to add to the effectiveness of that article.

The ships which enter Boston bring cotton from India, Egypt, Argentina, China and other points. There is, perhaps, but slight probability of pest introduction through that port since there is no cotton grown within a thousand miles, but the destruction which has been wrought by pink boll worm and the ordinary boll weevil has meant so much to the south that a repetition of the disaster because of the introduction of any other pest is avoided by this excess of caution.

The method of procedure is to bring the bales of cotton direct from the wharf to the vacuum plant and, as they are unloaded from the road truck, they are placed on a train of small cars, running on a track which extends into a great tube nine and one-half feet in diameter and 116 feet long. This tube is of heavy steel plate and solidly riveted, having the appearance of a great boiler for the generating of steam. There are four of these vacuum tubes. After the train is loaded to the full limit of the steel tube it is operated by an electric controller and run into the tube. The great iron door is closed and three monster air pumps set in operation to remove the air. When the gauges indicate a 25-inch vacuum the pumps are stopped, the generators of hydrocyanic acid gas are started and the chamber or cylinder is filled with the death dealing gas. Instead of one ounce of cyanamide per hundred cubic feet, as deemed sufficient by orchardists of California, the cylinder is given a charge of gas at the rate of six ounces of cyanamide to every hundred cubic feet. Other details will be given later, but be assured it was a most interesting sight.

Running from Boston down to New York, one finds the principal product, for a time at least, to be stone fences and innumerable wood lots which apparently have been abandoned, as to intensive production at least, and they are now being reforested in nature's own way. Frequently through these woodlots, or "slashings" as they would have been called a few years ago, there were to be seen gatherers of huckleberries and wild raspberries. Again there is proof of the still further use of this type of agriculture in a large factory for the manufacturing of extract of witch hazel, which is abundant all over the hills.

Near New York, through southern Connecticut, there were literally hundreds of acres of rich black soil covered with truck farms, where some of New York's lettuce, radishes and other garden products are produced. There were no Japanese gardeners, but there were many from Southern Italy.

I have taken a short journey through one of New York's nine large fruit markets. This includes Pier No. 21 of the Erie system, on which the daily auction of California's oranges, lemons and grapefruit is conducted. I have seen a quantity of California fruits exhibited in many different stores. At the present moment the principal ones observed are plums and "Vacaville" appears perhaps more often than others. California cherries are out, but all the United States has, this year, proved a wonderful producer of cherries.

Saw one lot of Imperial Valley cantaloupes, but it was not in any sense equal in appearance of crates, etc., to those which come from North Carolina, but of course, it goes without saying that Imperial has finished her season and many of these claimed to be from Imperial were in rather weather beaten crates which must have been in use several times and had the general appearance of a repack proposition.

Ordinarily California packages in appearance, and the fruit in quality, had the true California standardized appearance. One bunch of imported Mediterranean oranges, just opened, was literally alive with purple scale. Apparently eastern fruit growers have no fear of the introduction of this pest or the incinerator would have received this shipment. Such an exhibition in California markets would call for the furnace before it had been exposed many minutes.

# THE REASON WHY—

## California will supply the world's requirements for fruit food

Facts compiled from U. S. Government reports which prove that California is rapidly becoming the World's source of supply for fruit food.

**By J. E. BERGTHOLDT** Secretary and Manager of Silva-Bergtholdt Company, Nurserymen, and one of California's most extensive growers of fruit.

### *The First of a Series of Three Vital Messages to Fruit Growers*

EVERY PRODUCER has vivid recollections of the slump in the price of farm commodities during the fall of 1920. It is easy to remember how we entered the spring of 1921 with warehouses filled with the carry-over of the previous season's pack of dried and canned fruit—how dealers' shelves were loaded—how prices had gone to smash.

Being not only nurserymen, but extensive growers of fruit as well, and above all vitally interested in the prosperity of the industry, we applied ourselves to an intensive study of the situation.

The prospect was not assuring at that time. Conditions warranted the anticipation of a long cycle of depression in the fruit industry.

When the crop of 1921 had been harvested and growers had realized the proceeds from its sale at exceptionally good prices, one marveled at the rapid recovery to a status of prosperity on the part of California fruit growers; *whereas other producers, not alone in the East, but throughout the West, were still in the dumps.*

BUSINESS IN CALIFORNIA WAS GOOD BECAUSE THE FRUIT GROWER HAD MADE MONEY. Business elsewhere was poor!

While the spring of 1921 was one of gloom and depression, the spring of 1922 found every vestige of the 1921 crop gone into consumption and warehouses clean. The California fruit grower is harvesting his crop of 1922 with prosperity assured.

Why this marvelous recovery of the California fruit industry in advance of every other producing industry? There is a reason!

### *Figures Prove State's Advantage*

I have many times reiterated, in statements concerning the California fruit industry, that California, by reason of her natural climatic advantage, fertility of soil and abundant water for irrigation, was by Nature favored for Fruit Growing, as against the enormous climatic handicap imposed upon the fruit grower of every other state—that eventually California will supply the fruit of America in ever-increasing quantities, and not alone of America, but to a large degree, of the world!

In studying this situation, and seeking to verify my conclusions, I obtained figures from Washington and made a comparison of the census of 1910, as compared to 1920, so far as they related to fruit growing.

THESE FIGURES CONFIRMED MY SURMISE! Of themselves they tell the story. They are of vital interest to every fruit grower. They prove that by reason of the natural climatic handicap placed upon the Eastern fruit grower, his business is decreasing; while, by reason of the natural advantages accruing to the California fruit grower, his business is increasing!

### *How Condition Affects Growers*

It is not the intention to gloat over the misfortune of our brother producers in the East. Yet, by reason of the annually *decreasing acreage* devoted to fruit growing in nearly every state of the Union, there is being created a vacuum in the production of fruit throughout the United States. At the same time there is *an increase* in the consumption of fruit in the dietary of the American people. This condition will, in the years to come, *require every acre of land in California adapted to fruit growing, to supply the demand for this essential food!*

In view of these circumstances, California fruit growers should not go to sleep on the job. We should so organize our distribution and so exploit the potential consumption of our products to the American people, that California fruit products and their use will be as familiar to housewives and chefs as Cream of Wheat, Crisco or Ivory Soap.

### *Figures of Vital Interest*

IN 1920 THERE WERE 44% LESS FRUIT TREES BEARING AND NON-BEARING IN THE ORCHARDS OF THE UNITED STATES, OUTSIDE OF CALIFORNIA, THAN THERE WERE IN 1910!

According to the census of 1910, there were in orchard in the United States outside of California, bearing and non-bearing, 510,154,042 trees. According to the census of 1920, there were in orchard in the United States, outside of California, bearing and non-bearing trees numbering 285,326,973—making a decrease in the number of trees in orchard of 224,828,069, or a decrease of 44.07%.

This decrease, tabulated in the four leading varieties of deciduous fruits, is as follows:

NON-BEARING AND BEARING IN ORCHARDS IN ALL OTHER STATES OF THE UNION, NOT INCLUDING CALIFORNIA:

| | 1910 | 1920 | Percent Decrease |
|---|---|---|---|
| APPLES | 213,576,136 | 147,229,603 | 31% |
| PEACHES | 124,433,986 | 76,837,916 | 38% |
| PEARS | 22,205,334 | 16,214,668 | 27% |
| PLUMS AND PRUNES | 21,614,834 | 15,821,652 | 27% |

THE DECREASE IN ALL VARIETIES OF FRUIT GROWN IN EACH STATE, TABULATED BY GROUPS IS AS FOLLOWS:

| | Percent Decrease | Percent Increase |
|---|---|---|
| **NORTH ATLANTIC** | | |
| Maine | .263 | |
| Massachusetts | | .161 |
| Connecticut | .115 | |
| Rhode Island | | .14 |
| Vermont | .308 | |
| New Hampshire | .313 | |
| New York | .097 | |
| Pennsylvania | .066 | |
| New Jersey | | .033 |
| Delaware | .222 | |
| Maryland | .098 | |
| Virginia | .052 | |
| West Virginia | .043 | |
| **SOUTH ATLANTIC AND GULF GROUP** | | |
| North Carolina | .218 | |
| South Carolina | .264 | |
| Georgia | .005 | |
| *Florida | | .574 |
| Texas | .518 | |
| Alabama | .317 | |
| Louisiana | .458 | |
| Mississippi | .397 | |
| **MIDDLE EAST** | | |
| Wisconsin | .139 | |
| Michigan | .295 | |
| Illinois | .444 | |
| Indiana | .486 | |
| Ohio | .297 | |
| Kentucky | .312 | |
| Tennessee | .351 | |
| **MIDDLE WEST** | | |
| Arkansas | .559 | |
| Oklahoma | .524 | |
| Missouri | .586 | |
| Kansas | .712 | |
| Iowa | .581 | |
| Nebraska | .686 | |
| Minnesota | .242 | |
| South Dakota | .518 | |
| North Dakota | .209 | |
| **INTERMOUNTAIN STATES** | | |
| Arizona | | .132 |
| New Mexico | .487 | |
| Colorado | .482 | |
| Utah | .444 | |
| Wyoming | .148 | |
| Nevada | .351 | |
| Idaho | | .019 |
| Montana | .423 | |
| **PACIFIC COAST** | | |
| Washington | | .019 |
| Oregon | | .111 |
| California | | .296 |

The above increase in Florida was mainly in Citrus trees, of which there were in orchard in 1910, 5,242,375, and in 1920, 8,923,911 or an increase in Citrus alone in Florida of 70.2%.

By this grouping of States, you can readily note the sections wherein the local production of fruit is most rapidly decreasing. Even in such states as Georgia, Texas, Alabama, New York, Missouri, Arkansas, Michigan, Tennessee, Oklahoma and Ohio, which comprise the principal competitive fruit growing states, the number of trees in orchard is enormously decreasing, while no important fruit growing State shows any *increase* in trees in orchard excepting Florida (on Citrus) and Oregon and Washington.

THE AVERAGE ANNUAL PRODUCTION OF CALIFORNIA MEASURED IN DOLLARS AND COMPARED WITH THE ENTIRE UNITED STATES:

| | Production of California | Production of all United States |
|---|---|---|
| 1919 | $267,000,000 | $669,000,000 |
| 1920 | 233,000,000 | 744,000,000 |
| 1921 | 182,000,000 | 545,000,000 |

Measured in dollars, the production of California was 35% of that of the whole United States.

### *Production Per Tree*

Figured on a basis of the number of trees, bearing and non-bearing, in orchard in the United States, per the census of 1920, and the production in dollars of orchard trees, aside from Grapes, for the year 1919, 285,326,973 trees bearing and non-bearing in orchard in all of the United States, excepting California, produced $371,486,807 of tree fruits, or an average production in dollars of $1.30 per tree.

For the same year 64,387,338 trees, bearing and non-bearing, in orchard in California produced in tree fruits, not including Grapes, $202,037,218, or $3.13 per tree

This comparison is significant of itself, showing that in 1919, for every $1.30 that the fruit grower in other States produced from trees in orchard, the California grower produced $3.13, or an income in California of two and one-half times per tree the production of the average in the other States!

This information is of vital importance to the fruit industry and, in order that it be given out verbatim, and that it be given the largest possible circulation by using all farm papers, I am spending our own funds in the purchase of this space, in order to disseminate these facts and figures.

There are three angles to the story that I want to tell This is the first. Watch for the next.

J. E. Bergtholdt

Secretary and Manager,
Silva-Bergtholdt Company, Nurserymen, New Castle, California.

S-02-8-1

### DIP FOR SEED POTATOES

**A two minute treatment of seed potatoes has given splendid results in several eastern states in checking disease. The disinfection is accomplished by soaking them for two minutes in water at 118 to 122 degrees Fahrenheit which has received for each 30 gallons 2 pints of commercial formalin (40 per cent formaldehyde), then covering for one hour and drying. This formaldehyde method is said to equal mercuric chloride in effectiveness and to exceed other methods in other respects under farm conditions.**

**Field tests in Iowa showed tubers grown from treated seed to rank 75 per cent higher in setting qualities and in freedom from disease than those from untreated seed. In a cooperative community test 530 bushels were treated in less than six hours at a cost of 7 cents per bushel.**

### INCREASED OCEAN TRAFFIC

**During July 1-16 the bureau of plant quarantine of the California department of agriculture notes an appreciable increase in the number of passengers and lots of contraband material arriving from fruit fly ports.**

**A report received July 21 from San Francisco shows a total of 59 ships and nearly 5000 passengers from ports under fruit fly quarantine.**

**Fair Oaks, Sacramento County: Grapes fine and very little burn; past week with cool weather has been of great help to fruit men.**

## "HYDRO" AS IS IN ONTARIO, CANADA

(Continued from Page 125)

cedure required to secure installation in a rural community. The rural service is handled in a way materially different from the cities. A municipality usually controls its own distribution and even owns its distributing system. The commission delivers the required K.-W. hours to the municipality, which not only distributes but makes collections and handles its own financial system. A rural district which may wish to organize presents a petition to the commission which must be signed by at least three consumers for every mile of line to be constructed within the district, these consumers agreeing to pay a certain minimum.

The most complete information as to this procedure is given by quoting a circular which is sent from the central office to each prospective consumer:

### A Letter to the Prospective Consumer

In respect to certain petitions received from your township through your council from time to time, requiring estimates on the cost of supplying power to such petitioners, I am instructed to advise you that all estimates forwarded by this commission are hereby superseded on account of certain revisions adopted in the manner of serving rural districts, and chiefly on account of the recent legislation bonusing rural lines.

I am instructed to advise you that the supplying of power in rural districts shall be conducted after a manner outlined in the revised legislation, part 11-B of the Hydro-Electric Power Commission Act.

It is required that a proper contract be executed between your council and the commission for a supply of power and to permit of the commission constructing and operating the lines necessary to serve the customers.

The commission will conduct the business associated with the rendering of service to your customers, and will properly account to your council for all charges and revenue connected therewith.

Users of power in your township will be required to sign a contract with the township, and may choose, with certain limitations, classes of service outlined as follows:

Class I—Hamlet service includes service in hamlets, where four or more customers are served from one transformer. This class excludes farmers and power users. Service is given under three sub-classes as follows:

I-A—Service to residences where the installation does not exceed six lighting outlets or 12 sockets. Use of appliances over 600 watts is not permitted under this class.

I-B—Service to residences with more than six lighting outlets or 12 sockets, and stores. Use of appliances over 750 watts permanently installed is not permitted under this class.

I-C—Service to residences with electric range or permanently installed appliances greater than 750 watts.

Special or unusual loads will be treated specially.

Class II—House lighting includes all contracts where residences cannot be grouped as in Class I. This class excludes farmers and power users.

Class III—Light farm service includes lighting of farm buildings, power for miscellaneous small equipment, power for single phase motors, not to exceed 3 horse power demand, or electric range. Range and motors are not to be used simultaneously.

Class VI—Medium single phase farm service includes lighting of farm buildings and power for miscellaneous small equipment, power for single phase motors up to 5 horse power demand, or electric range. Range and motors are not to be used simultaneously.

Class V.—Medium three phase farm service includes lighting of farm buildings and power for miscellaneous small equipment, power for three-phase motors up to five horse power demand, or electric range. Range and motor are not to be used simultaneously.

Class VI—Heavy farm service includes lighting of farm buildings and power for miscellaneous small equipment, power for motors up to five horse power demand, and electric range, or ten horse power demand without electric range.

Class VII—Special farm service includes lighting of farm buildings, power for miscellaneous small equipment, power for three phase motors from 10-20 horse power demand, and electric range.

Class VIII—Syndicate outfits include any of the foregoing classes which may join in the use of a syndicate outfit, provided the summation of their relative class demand ratings is equal to the kilowatt capacity of the syndicate.

| Name— | Demand Rating K.W. | H.P. | Average Monthly Consumption K.W.H. | Est. An. Service Charge | Est. An. Charge | Total Est. An. Cost |
|---|---|---|---|---|---|---|
| Hamlet service (a) | ½ | ⅔ | 10 | $7.32 | $17.08 | $24.40 |
| " (b) | ¾ | 1 | 15 | 10.80 | 19.74 | 30.54 |
| " (c) | 2 | 2⅔ | 150 | 76.92 | 34.42 | 111.34 |
| House | 1 | 1⅓ | 15 | 12.48 | 25.40 | 37.88 |
| Light Farm | 3 | 4 | 40 | 34.56 | 55.76 | 90.32 |
| Medium single phase | 5 | 6⅔ | 70 | 60.48 | 60.00 | 120.48 |
| Medium three phase | 5 | 6⅔ | 70 | 60.48 | 76.04 | 136.52 |
| Heavy farm | 9 | 12 | 150 | 119.28 | 115.79 | 235.07 |
| Special farm | 15 | 20 | 200 | 220.32 | 170.08 | 390.40 |

The estimates on the cost of power delivered to users as herein set out as has been based upon certain assumptions, some of which are as follows:

The construction of the lines shall be undertaken and paid for by the commission. The farmers in the vicinity of the roads along which the lines pass will assist in the construction and assistance will be paid for at a suitable wage. Lines constructed from the line on the highway to customers' premises will be paid for by the customer. The commission proposes to supply the necessary expert labor to direct the construction of the lines and the installation of the equipment. It has been assumed that three farmers per mile of line, or the equivalent, are obtainable as an average for the entire district to be served. The supply of poles at low prices in the district or the vicinity of the district by efforts on the part of those desiring service will result in the reduction of the cost of construction and corresponding reduction in the cost of service. Cooperation resulting in the reduction of cost of construction is desired. The rates herein set out are also based upon a government bonus of 50 per cent of the cost of primary lines constructed on the highway or along the right-of-way.

Charges for power delivered shall consist of two parts, namely, the service charge and the consumption charge. The service charge which constitutes the greater portion of the total cost of power delivered, consists of the operating, maintaining and fixed charges of the lines and equipment required to deliver the power to the users in the district. Consumption charges will be determined by a meter at each customer's premises, which will measure the quantity of power used, to which a suitable rate will be applied. This cost can only be arrived at when the amount used has been determined. The rate used in the district will be determined by the cost of power at the transformer station supplying the district. The amount of power supplied to the district will be metered at the transformer station.

The meter rates for users in that part of your township which will be supplied from ....., are estimated as follows: 8c per kilowatt hour for the first 14 hours per month of customers' class demand rating; 4c per kilowatt hour for all remaining uses; less 10 per cent for prompt payment.

The following table gives class demand rating, average monthly kilowatt hours, estimated consumption charge, estimated service charge, and total estimated annual cost for each class:

The above costs are calculated from our knowledge of the use of electric power in rural districts under average conditions. They have been adjusted by applying the rates as set out herein.

For those unfamiliar with terms used in power measurement, it is to be noted that one kilo-watt (K.W.) is approximately equal to 1⅓ horse power (H.P.) or 3 K. W. equals 4 H. P., and a kilowatt hour (K. W. H.) is the amount of electricity equivalent to one kilowatt used for one hour.

The rates will be readjusted by the commission from time to time in your district to cover cost. Increase in the average number of farmers per mile or lower cost of power will reduce annual costs to all.

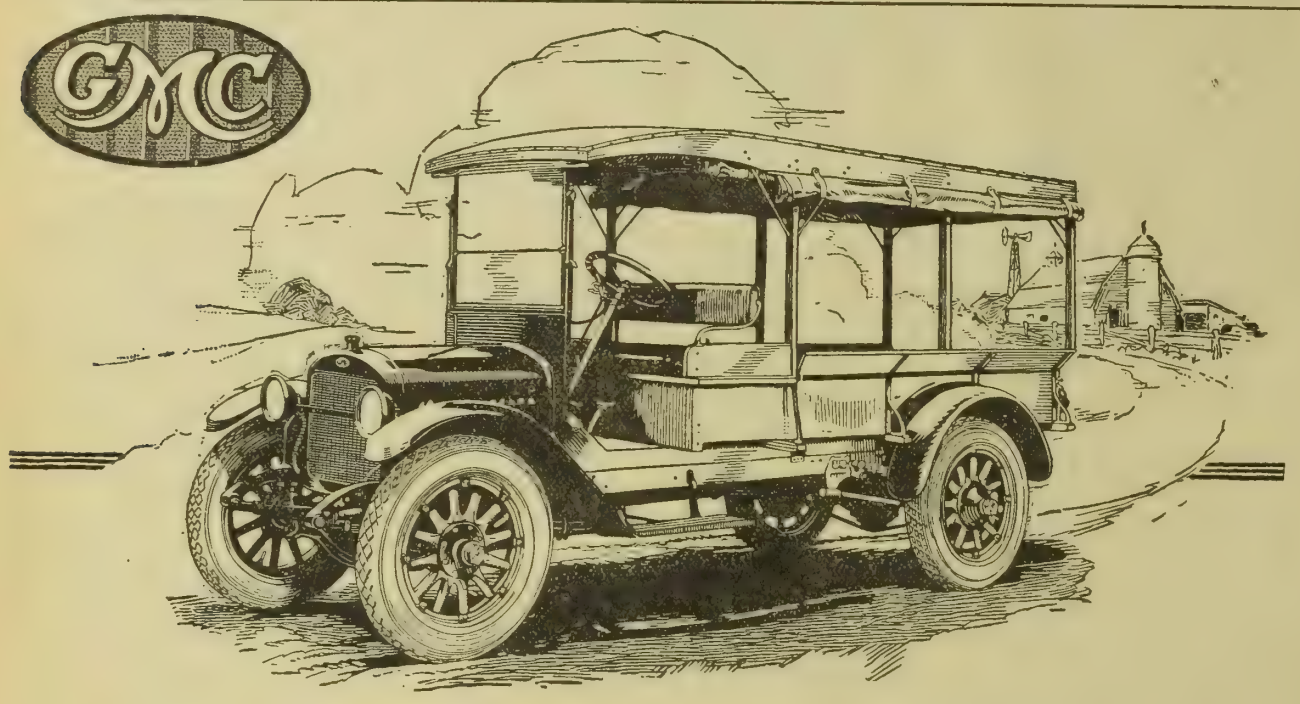
The commission upon request by your council will send a representative to explain the method of rendering service to rural communities, and will assist your council in securing contracts with individuals desiring service.

(Signed) F. A. GABY,
Chief Engineer.

### As to the Bonus

A word as to the bonus referred to in the circular letter above. From the very first the commission has insisted that "cost" should be borne by every district. This put a handicap on rural districts where consumption is slight. The burden was so great that many districts refused to participate. To overcome this the commission is using from the hydro rentals fund and is bearing one-half the installation expense in rural districts. Not one cent of provincial or other tax money has

GMC



# A "Jim-Dandy" Truck

## *Model K-16 One Ton*

It's a Jim-Dandy! That's the universal opinion of the GMC one ton truck.

Fast on the road, powerful in the hard going and economical all the time, this sturdy honest-to-goodness truck is just a "Jim-Dandy" for the farm.

It will haul produce, stock, milk and any other kind of load better and cheaper than a motor truck has ever done before.

For this GMC has improvements which are away in advance of ordinary motor truck construction and which make possible more continuous haulage, lower operating and lower maintenance costs. Such features as Removable Cylinder Walls, Pressure Lubrication, Removable Valve Lifter Assemblies and Instantaneous Governor, are all designed to produce the kind of performance that is vital to the success of a motor truck on the farm.

Model K-16 is a real motor truck, built entirely of truck units—no passenger car parts used.

In addition it is built in the most approved designs of motor truck construction. For instance, this one ton truck has Magneto Ignition, admittedly the most reliable type.

The Ignition is simple, just four wires leading from the Magneto to the spark plugs and all in the open where it can be readily inspected.

The Model K-16 also has Electric Lights, Starter and Generator with a Storage Battery built especially for motor truck use and of extra capacity. The wiring is all carried in metal conduits and is entirely separate from the Ignition System.

Demountable Rims, Cord Tires, Pressure Gun lubrication of the chassis. Extra Switch for spot light and Interchangeable Brake Rods are other GMC refinements.

No truck of like quality has ever been offered at as low a price as this chassis—$1295 at the factory.

Write for an illustrated booklet "Motor Trucks on the Farm."

ever been taken to bear any of the hydro expense nor in any way used in the development work. It must pay its own way, its own interest and provide for its own replacement in another 20 years.

### The Next Letter

The next letter—possibly not next week, but soon—will touch upon the thrill which comes to a fellow when he sees the equivalent of fifty five thousand horses on one "drawbar." Note I am promising to "touch upon" only. I'm reading the dictionary for synonyms of thrilling or any other word which will help me describe one's feelings when he sees a 55,000 horse power team on the job. And along side that team is another and another, each with 55,000 horses unleashed from old Niagara.

## NEMATODES

**By R. R. Snowden**

The nematode is surely getting to be a factor of destruction to be reckoned with. I saw a beet field in Utah that looked as if a fire had swept over it. At another place I was told if something is not found to successfully combat the nematode the beet sugar industry is doomed. Here I saw a beet field in which the plants averaged about 8 feet apart, due it was said, to nematodes, and I found the roots of the plants left badly infested with them.

Potatoes and many other crops are also subject to its ravages. I have been successful in several attempts to combat the nematodes, the tests being made on beets and potatoes (Irish). In the first trial, in Los Angeles County, the treated beets had no nematodes while the others did have them. The second trial was in the beets that looked as though blasted by fire. A number of plants in different parts of the field, about 15 in number, were treated in June of last year. Examination in October showed the treated beet roots to be about double the size of the others.

The tests on beets this year in nematode infested fields are very favorable at this time but are not yet completed.

In a test on potatoes this season in a badly nematode infested area the treated plot had no nematodes and the tubers were reported larger than the untreated, and there were not so many small ones.

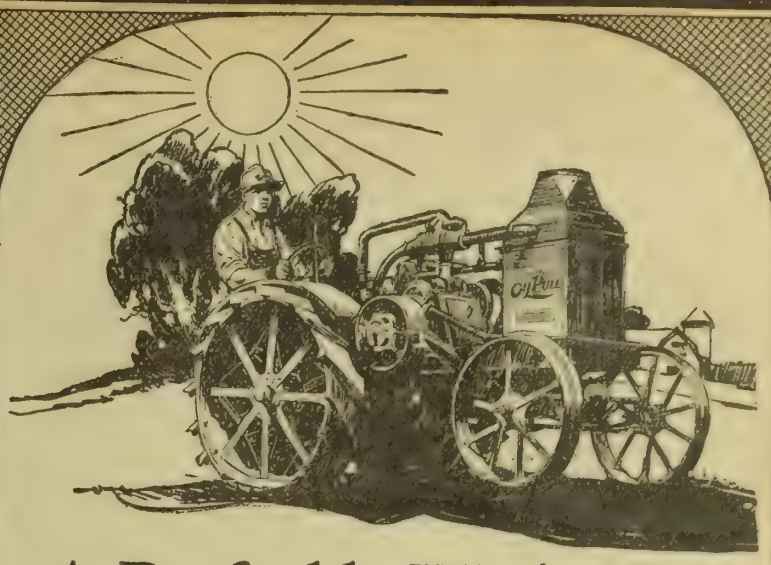
The material used in all these tests was nitrate of soda, which is destructive to all small animals by contact with them. A small toad was accidentally brought in contact with it, and although it was carefully brushed off at once it was dead in five minutes. There is, however, no danger whatever to persons handling it with the hands.

## FUMIGATION IMPORTANT THIS FALL

Climatic conditions, insect enemies and fungus diseases have had a part in causing a high natural mortality of black scale in Los Angeles County citrus orchards during the past winter. Inspector J. R. Hodges of Covina reports a large mortality of black scale because of the attacks of the Isaria fungus. Although the present infestation of black scale in defioliated citrus groves is lighter than normal there is every reason to expect that the unusually large percentage of the new hatch in such orchards will live because of the ample food and protection afforded them by the abundant tender new growth. It is, therefore, more than ever important that groves of this type be fumigated while the scale is at a minimum.—H. J. Ryan.

## CAPRIFICATION SUCCESSFUL

Growers of Calimyrna figs in practically all sections report successful caprification of their trees, which appear to be in excellent condition. Last season growers were not sufficiently interested in figs, in many cases, to caprify their trees, but this year both the supply and the demand for caprifigs was good, indicating a healthier condition of the industry. The Adriatic crop has undoubtedly been reduced one-half in some orchards, although the total crop will probably not be reduced more than one-quarter. The larger sizes of the figs may make up for the lack in numbers.



A Profitable Worker in Hot Weather
Hot weather makes no impression on this sturdy, oil-burning, oil-cooled OILPULL Tractor.
Triple Heat Control prevents overheating. The powerful, twin-cylinder, oil-burning motor actually runs cooler under heavy loads than under light loads. There is no evaporation, hence no refilling. Your work, whether it is plowing, road work or belt jobs, goes along steadily 10, 12, 18 hours and even longer on hottest days. That is profitable service.
OILPULL
"The Cheapest Farm Power"
The OILPULL saves money in any weather. It burns kerosene, distillate or stove tops. It saves 39% in fuel. It saves 50% on upkeep. These figures are proved by authoritative tests and comparisons. And it is such savings that make the OILPULL so economical to operate and so very cheap in the end. OILPULL life averages more than 10 years.
All in all, the OILPULL, because it is a quality machine and because it is the only tractor with Triple Heat Control, is the cheapest tractor to own, summer or winter.
If you want further proof, see the local Advance-Rumely dealer. In the meantime, please write in for a copy of our widely read booklet, "Triple Heat Control."

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Subsoiling and Deep Irrigation

I would like to get information along the lines of deep irrigation and persistent subsoiling with land that is of a cement nature and adobe together with a red sediment mixture. In other words, I want to put my irrigation down in the soil, not on top as previously, and I have peaches, oranges and some vines. I was under the impression that I might use a subsoiler every time I did a job of irrigation, especially the way the land would irrigate, not crosswise, and the crosswise subsoiling would be done every fall. Trees are set 22 feet apart. Could I run a subsoiler, single standard, through this space every three to four weeks, and follow in the path with the water, and still not add too much water to the soil or to the trees or vines? Vines are 11 feet apart, and here it would require only a single standard one way at each period of irrigation. Would this deep irrigation and tillage be harmful by cutting feeder roots? Trees are from four to nine years of age and vines about three.—Subscriber, Visalia

A single standard subsoil plow could no doubt be used to advantage on this land, but unless the land is very much inclined to run together it will not be necessary to use the subsoilers every time the irrigation is done. That, however, can be determined afterward. One subsoil furrow in the center of each tree space and across the furrows carrying the water will be better than to run the water in the subsoil furrow. The single standard subsoiler can be run in both directions once, in the center of each tree space, but in beginning it will be better to go in one direction only the first year. Some of the feeder roots will be cut in any event, but if the subsoiling is practiced the roots of each tree or vine will be confined to its particular square and have the use of as much soil as it would have with longer roots and other trees encroaching on the space around that particular tree, with advantage of more water and better distribution of water. The furrows carrying the water should be made as deep as can be conveniently done. Eight to ten inches will not be too deep and they should not be more than three feet apart. Use very small streams of water which should run slow enough to be clear when it reaches the lower end of the furrow. The water should be kept running in the furrows until it has reached the depth of four feet, which can be determined by digging. Cover the furrows with a cultivator, or whatever implement will fill them with fine earth, as soon as a team can get on the ground, and then work up your mulch to a depth of four to six inches with whatever implement will do the best work. Repeat the irrigation whenever the soil taken from six inches below the surface cannot be compacted into a ball by the pressure of the hand. In this way you will keep the soil in good condition without danger of injury from too much water. Strawy manure plowed under deeply, or, better yet, successive crops of a deep rooting leguminous cover crop will improve the water holding properties and at the same time enrich your soil. The first subsoiling should be done when the trees are dormant, but if the same furrow is followed each time no damage will be done at any time of year.—J. B. N.

### Melon Wilt

Am sending part of watermelon vine. Please note that it is a gum disease. What is it and what will cure it. It has killed nine vines and others are going.—Spbscriber, Ontario.

This is clearly a case of melon wilt, a fusarium by name. As is the case with all diseases having similar effects, there is nothing to do for this season's crop. Growing melons where none have been grown for several years and where water cannot wash from infected area is the only plan that offers success.

### Apricots on Coast

I am considering the planting of apricots on a mesa about 200 feet high. This mesa is on the coast, descending precipitously to the water. Needless to say we get considerable fog at certain seasons, notably in the month of June and early in July. Are these conditions unfavorable to apricots? Also is speckled fruit the result of too much fog and is the fruit quality injured by this skin spotting? I have heard that in some coast regions brown rot is prevalent; if so, should this be ascribed to coast conditions?—Subscriber, Carpinteria.

We do not consider your location favorable for the successful growing of apricots. No doubt the trees will grow well and may fruit abundantly but your crop will be inclined to be of poor quality. It is also difficult to sun dry apricots near the coast. The eating quality of the fruit may not be injured by skin spotting but its appearance will seriously affect the selling of such fruit.

### Rotating Beans

I have seen repeatedly the statement that the culture of beans indefinitely without rotation benefits the soil and increases the yield. In your issue of July 22 Manager R. H. Frazer of the California Bean Growers Association again makes this statement. Within the week I have noticed an interesting condition in one of my bean fields. This field has been planted to beans continuously for the last 20 years. Until this year there has always been a large rock pile in the center of the field. Last fall we hauled off these rocks and a day or two ago in walking through the field I saw in the distance a circular patch of beans that stood out from the others like a dark green island in a light green sea. When I reached it I found it to be the erstwhile rock pile. The plants were easily twice the size of those all around them and of a more healthy color. It would seem to me that the error in these statements regarding the successive cropping of beans is that all the emphasis is laid on the increase of nitrogen in the soil. Humus is also an important element in the growth of any crop and unless the bean straw is returned to the soil or some other form of humus is added it would appear that in time the soil must suffer.—R. W. Bates, Carpinteria.

### Both Self Fertile

I have planted three Wickson plum trees and ten Bartlett pears among the orchard. Will it be necessary to plant other varieties near them before they bear fruit? If so, what kind?—Subscriber, Nipomo.

No. Both the Wickson plum and Bartlett pear are self fertile.

### How Much Lime?

I have some wet bottomland, about a quarter of an acre, which is very sour and weedy and to which I would like to apply some lime. Will you kindly advise me through your paper how much lime to use; would it be proper to plow the lime in with a small one horse plow? Will airslacked lime do?—Subscriber, Arroyo Grande.

The best lime for the very sour and weedy bottom land is freshly slaked lime applied at the rate of one ton to the acre. A one horse plow would be as good as any to plow it in with, since this form is soluble in water and will find its way to greater depths.—R. R. S.

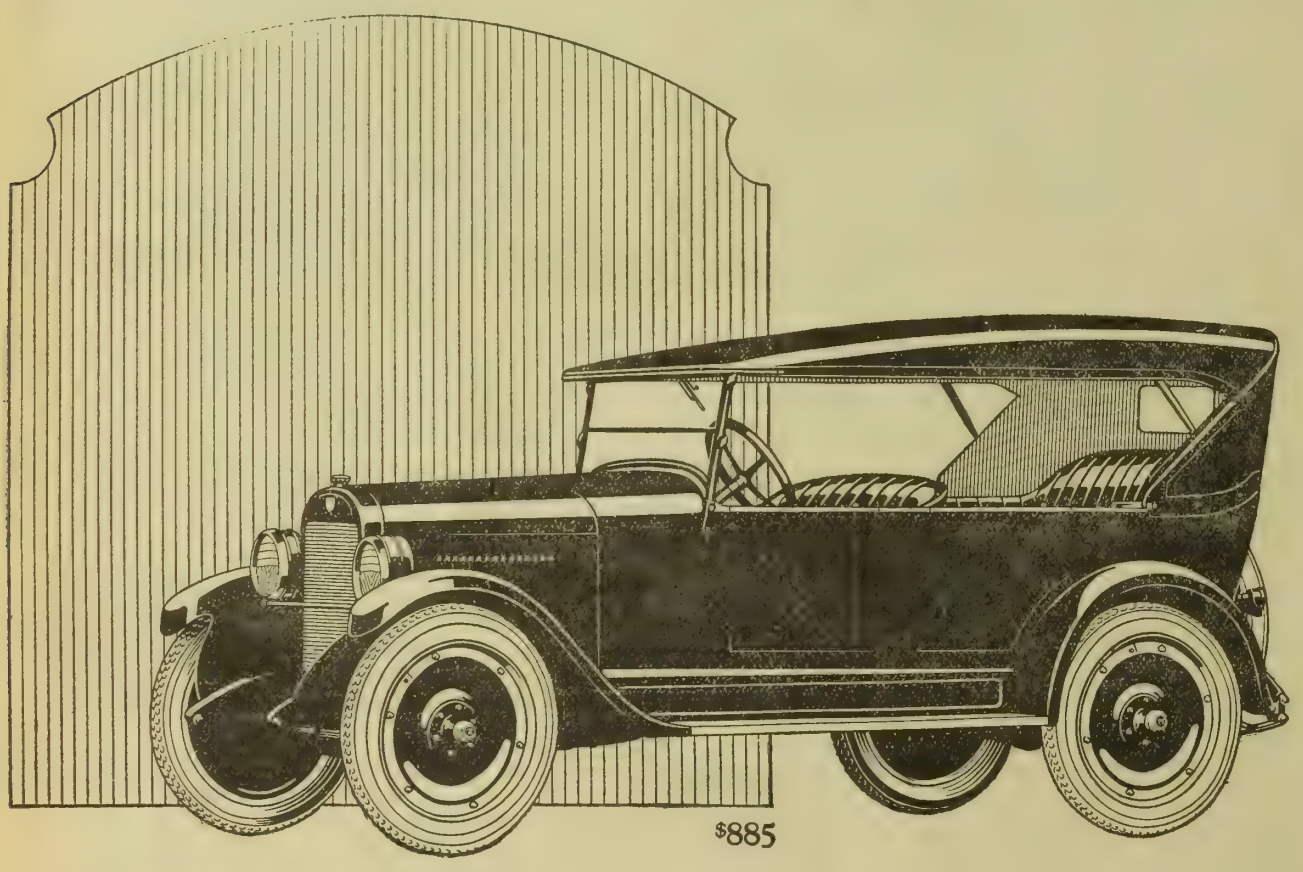
### Ornamental Plants

Where can I get the vine Tecoma grandiflora, also a yellow climbing rose known as Cloth of Gold? I presume I can get Climbing Kaiserin Augusta Victoria and Caroline Testout at almost any plant nursery?—Subscriber, Lodi.

The roses will be found in all nurseries where roses are grown except, perhaps, the Cloth of Gold. Although on old rose, of fine color, in many sections it grows poorly, flowers but little and climbs less. It really is a "pillar" rose, scarcely a climber. The trumpet flower, Tecoma grandiflora, is really rare, but dealers should be able to find it for you as some aways have it. We will be pleased to forward to our correspondent the name of anyone having this vine for sale.

### Stock Destroys Dodder

In a recent issue of Cultivator I noticed some one asking a way to get rid of love vine or dodder. In answer, will say that hogs, cattle or sheep will eat readily either green or in hay. So last spring I fenced off several acres of alfalfa badly infested with love vine. I pastured the field with hogs and a few cows. All love vine is gone. In



MAXWELL

Cord tires, non-skid front and rear; disc steel wheels, demountable at rim and at hub; drum type lamps; Alemite lubrication; motor-driven electric horn; unusually long springs; clutch and brake action, steering and gear shifting, remarkably easy; new type water-tight wind-shield.

First among the virtues of the good Maxwell are the ruggedness and reliability which the farmer wants and needs in his motor car.

*The Good*

MAXWELL

small patches one could make a panel pen for hogs or sheep and kill out small patches. As to feeding value of love vine I know nothing.—Will Bigelow, Poleta.

### For Milk Goats

I am feeding my goats green morning glory, alfalfa meal and bran, and they do not seem to give the milk they should. Can you give me a standard ration for milk goats?—Subscriber, San Jose.

A good many goat people use a prepared goat feed, which is a mixture of rolled barley, crushed corn, dried beet pulp, oats and perhaps other ingredients. This, with alfalfa hay, makes a very satisfactory ration. If you do not care for a prepared feed you might try a mixture of bran and rolled barley, or soak a handful of beet pulp overnight, and dry with bran in the morning. Some goats will not eat beet pulp, but it is one of the best feeds if carefully used. Bran makes milk, but, like beet pulp, must be fed with moderation. The goat is a finicky animal, and it pays to consult her tastes. Of course you know goats are crazy for any kind of tree prunings, and young grape shoots are their greatest treat. They need a great deal of roughage, and alfalfa hay is indispensable when there is no range.—J. A. K.

### Grape Leaf-Folder

My grape vines, of different varieties of table grapes, are being seriously injured by a worm which rolls itself up in one side or edge of the leaf. It does not eat very much of the leaf, but seems to have a blighting effect. Later in the season so many leaves have turned brown and dead as the result of their work that the vines look very far from ornamental. I fear they will soon die, as the amount of injury increases each year. When you unroll the leaf you may sometimes find a small green worm, three-fourths of an inch, or perhaps an inch long. It quickly wriggles out. Usually you will find that it has done its work and departed. Only its droppings remain. Sometimes there are little webby threads that hold the leaf rolled. I do not see how we could spray with poison even if that would do any good. No one would like to use the grapes. What are the life habits of this insect and what can we do for it?—E. W. D., Tancred.

The insect affecting your grapevines is, undoubtedly, the grape leaf-folder. While this insect does not fold the leaf, it rolls it and probably should have the name of grape leaf-roller. In any case it is not considered a serious pest, although occasionally it becomes so numerous that practically all of the leaves of grape vines are rolled and thus prevented from functioning properly. It is impossible to practice control measures after the appearance of the curled leaves. Arsenical sprays, if applied early enough, are effective, but it is not often that one can anticipate the unwelcome visits of this pest in time to apply a remedy. The grape leaf-folder is reduced in numbers very materially by the activities of a small parasite. Consequently it does not often appear in great numbers two consecutive seasons, and you will probably have nothing to fear from its recurrence next year. You should give your vines additional care that they may successfully withstand the present attack. Other than this we can give you no advice.—F. K. H.

### Thrips and Spider on Beans

What shall I do for an insect on my beans? It begins at base of plants, gradually taking all the plant, plants turn yellow and leaves fall off. Under microscope two insects show, one reddish yellow similar to aphis but much smaller. The other is larger, grayish black, with white markings. I inclose infested leaf.—Subscriber, Paradise.

Your beans had both thrips and red spider. Both were injurious, but the thrips did most damage. Both are gone now (and perhaps beans are too.) Neither pest remains long and remedial measures, to be effective and protective, must be applied early. Spray to be used is made of commercial lime-sulphur five and one-half gallons; black leaf 40 (a tobacco decoction) 14 fluid ounces; water, 200 gallons. Four gallons of flour paste, made with one pound of flour to one gallon of water, to every 100 gallons of any spray will prove an aid.

### Citrus Dying

My young citrus trees are continuing to die apparently from the effects of last winter's freeze. Trees that look strong and vigorous and that came through the freeze in good shape suddenly wither and die. I followed the instructions of the farm advisor by wrapping all trees with twine, several months later painting the entire trunk with Bordeaux, cutting out the dead and wrapping with yucca. I water and cultivate every three or four weeks and the soil seems to contain plenty of moisture. Can you offer an explanation of the cause of this condition and recommend any action to take at this time for treatment?—Reader, Monrovia.

Evidently your young trees were more seriously hurt that appeared at first. A careful examination of the trunks will no doubt show dead bark extending nearly, if not entirely, around the tree at some place between the surface of the ground and the branches. Trees injured in this way very often show a healthy top and make some growth from the limited circulation of sap that for a time passes through the uninjured tissue, but this supply is gradually reduced as the injured cambium dries and suddenly the apparently healthy top withers and dies. There is nothing that can be done now to prevent this but if the injury is above the bud so that a healthy shoot can be grown, we would suggest cutting off the old top and training up one of these and forming a new head.

### HATPINS AND BUTTONHOOKS

Returning from school, a little girl proudly informed her mother that she had learned to "punchtate." "You see, mother," explained the child, "when you write 'Hark!' you put a hatpin after it, and when you ask a question you put a buttonhook!"

### PRUNE PRICES IN WASHINGTON AND OREGON

Prices announced late in May by the Washington Growers' Cooperative Association for 1922 prunes range from 6½ cents per pound for 80-90s to 11 cents for 40-50s, in 25-pound boxes, f. o. b. Vancouver, Washington. The price will be uniform in Washington and Oregon, but charges for packing and freight will be deducted from the amount due grower members on this basis. About 40 carloads had already been sold in advance of the announcement.

### BARTLETT PEAR BULLETIN

We are just in receipt of Bulletin No. 1072, sent out by the department of agriculture on the handling, shipping and cold storage of Bartlett pears in the Pacific coast states. This bulletin should be of particular interest to pear growers, especially in regard to the cold storage recommendations.

Copies may be had by addressing the department of agriculture, Washington, D. C.

# Goodrich
## announces
# new tire prices
## —lowest cost mileage ever known

Effective July 20th, Goodrich established a revised price list that is a base line of tire value. It gives the motorist the buying advantage of knowing that whatever size tire he selects is of the same quality—*the Goodrich one-quality standard.*

It gives him the longest mileage, the most satisfactory service and the highest quality his money can buy. Results will prove that it is impossible to buy tire mileage at lower cost.

*Think of being able to buy*

# Silvertown Cords

*at such prices as these:*

| SIZE | BASE LINE PRICE | SIZE | BASE LINE PRICE |
|---|---|---|---|
| 30 x 3½ Cl. | $13.50 | 34 x 4 S.B. | $30.85 |
| 31 x 3.85 " | 15.95 | 32 x 4½ " | 37.70 |
| 30 x 3½ S.B. | 15.95 | 33 x 4½ " | 38.55 |
| 32 x 3½ " | 22.95 | 34 x 4½ " | 39.50 |
| 31 x 4 " | 26.45 | 35 x 4½ " | 40.70 |
| 32 x 4 " | 29.15 | 33 x 5 " | 46.95 |
| 33 x 4 " | 30.05 | 35 x 5 " | 49.30 |

*New base line prices are also effective on Goodrich Fabric Tires:*

| SIZE | BASE LINE PRICE | SIZE | BASE LINE PRICE |
|---|---|---|---|
| 30 x 3 "55" | $ 9.65 | 32 x 4 S. B. (Safety) | $21.20 |
| 30 x 3½ " | 10.65 | 33 x 4 " | 22.35 |
| 32 x 3½ S. B. (Safety) | 16.30 | 34 x 4 " | 22.85 |

*No extra charge for excise tax. This tax is paid by Goodrich*

This revised price list affords the motorist a definite guide to tire prices as Goodrich Tires are the definite standard of tire quality.

### A LITTLE WORD

The breath of spring was in the air;
My heart was light and free;
Sweet flowers nodded everywhere,
And, oh, so merrily.
I trod the path I loved,
For life was bright and gay—
But some one spoke a bitter word
And all the world seemed gray.

Thick hung the heavy clouds o'erhead;
My aching heart was sore;
The nodding flowers were long since dead.
As wearily once more,
I trod the path to home;
All life was dark as night—
But some one spoke a loving word,
And all the world seemed bright.
—Irene Judy.

### HOW THE KING TRIED TO TAKE THE "A" OFF "ROBERTA"

By Clara Peterson

THE king of Candelabra had always wanted a boy, but he had a girl instead. Her name was Princess Roberta. She was eight years old and healthy and strong and smiling. She even had brown cheeks and straight bobbed hair like a boy, but she had one habit which made the king ever so sad. She was continually dressing up.

Just when the king had gotten himself to thinking that perhaps after all Roberta was nearly as good as a boy, along she would come, dancing across the marble floor or tiptoeing across the velvet rug, with the kind housekeeper's lace scarf wound around her rompers and a wreath of clover blossoms on her head.

Or, the king would find her in the nursery with the white bear rug for a cape and orange satin ribbons tied around her wrists and ankles.

One day he even found her in the purple throne room which was supposed to be kept closed. She must have been there because the throne room held the very largest mirror in all the palace. Roberta was standing at the corner of the mirror, which was as low as the crimson carpet and as high as the golden ceiling. There was a pile of shaving curls on the floor beside her.

"Great jumping jacks!" cried the king, peering over his spectacles. What are you doing now?"

Fourteen snap clothespins from the laundry stood up on the little head of Princess Roberta, or drooped over her neck and ears. Each clothespin had closed very tightly on a lock of straight brown hair.

"My shaving curls kept falling off," said the Princess Roberta. "I'm just standing here waiting for real curls to come. I think my hair will be quite wavy."

The king thought about his daughter all night. He was sure that she would be unhappy if she grew up to be just a girl, so he decided to change her at once and have it over with.

Away up on the third floor of the palace was a sunny room with one window. There was nothing in it but a plain brown rug and a plain brown chair and a plain brown table.

The king nodded his head at the room. He went down stairs and climbed into his largest automobile, and away he went honk! honk! to the largest toy store in all the city.

The store people were quite excited when they saw the king. Even the newest clerks knew at once that he was the king for he had on such a shabby old suit that anyone else would have been ashamed to wear it.

"Ho, hum," said the king to the tallest clerk, the one with the striped trousers and handsome green vest. "Ho, hum! Show me everything you have in toys for boys!"

It was lucky that that was a big automobile, for when the king drove back to the palace, it held:

One small steam engine which really steamed.
One train which flew around in circles through tunnels and over bridges.
One set of building blocks.
One sled with a dandy brake
One box of steel parts which could be built into just about everything.
One scooter.
One football.
One baseball and a hickory bat.
One tool chest.
One pair of stilts.
One air-gun.
One wigwam and an Indian outfit of leather.

When the king walked into the nursery the princess had just finished her breakfast of oatmeal and milk. She was trying to make her napkin into a nurse's cap.

"Come with me, Roberta," said the king. I am very glad that you have on plain white rompers and plain white shoes and stockings. It is as I like to see you."

He thought to himself that the princess would have been trimmed up in some way if he hadn't caught her just in time, but he didn't mention that—just took her by the hand and led her up to the sunny room.

All of those wonderful, exciting toys were scattered about the room. There was also a bed in it now and on the plain brown table a lamp with a plain pink shade.

"I'd like to have my little daughter live here for two days and nights," said the king. "Enjoy yourself, my dear. I shall see the cook about lunch for you—corn on the cob and lemon pie and plenty of other things."

The princess had heard all her life that corn and lemon pie weren't good for little girls, so she knew that her father was trying to be kind indeed. She heard him turn the catch on the door and she walked over and looked out the window.

Roberta couldn't see anything out of the window except four of the palace dogs having a terrific fight near the fountain, so she turned around and began to look over the room.

"This must be a sort of attic," said Roberta. "Oh, dear, I want my Angeline Rosemary Marie." This was her rag doll.

She sat down on the bed, fingering the coverlet. In a moment her eyes began to smile and smile.

The king could hardly keep away from that sunny room with the one window. He didn't exactly feel sorry for his little girl because he knew that she had a dozen fascinating things to play with. He kept wanting to peep through the keyhole to see what a good time she was having, and he might have done it if the footman hadn't found him on the second stairway and announced the Earl of Snappergrass from over the mountains.

The king and the Earl of Snappergrass sat down in the dining room and lunched on peacock pie and bread pudding. They were very glad to see each other for they were old school friends, and they talked about the weather, and how to keep servants, and a great many important matters. The earl didn't have any children and finally the king just couldn't keep still about Roberta a moment longer.

He cleared his throat and began: "Roberta is a very different child from when you last saw her. She is very much like a boy, strong and healthy, and her hair is as straight as sticks."

Just at that moment the butler refilled the king's coffee cup and the king couldn't help saying to him:

"Sam—just send some one up to the brown room for the Princess Roberta; I want the earl to see her."

He went on talking, not even knowing that his chest was puffing out with pride, just like the pigeon's outside the window.

"Yes, Snappergrass, you will be surprised at Roberta. Even now she is up in the brown room entirely surrounded by toys for boys."

The earl put down his cup and patted the king very gently on the back.

"Never mind, old fellow, I dare say she'll get over it. I know how sad you feel about having a girl who is like a boy, but don't talk about it, don't worry about it. She's young yet. Give her dolls and ribbons and—"

The king's mouth was wide open as he looked into the pitying face of the earl. Then he turned his head, for the Princess Roberta stood between the silver curtains of the doorway.

"Great jackingjumps!" cried the king.

A pink and blue princess was bowing to them. She wore a lovely kimona of striped silk like roses and the sky all mixed together. It was tied with a golden cord, and on her head was a pale pink bonnet like a crown. Her blue eyes sparkled when she saw the

earl. She danced over and held out her hand.

"How do you do, Mr. Snappergrass. I remember you!"

After Roberta had been kissed and kissed and her father had heard and seen how very sweet she was and what an enchanting big princess she was going to make, he unwound her arms from his neck and set her down on the pale green rug.

"And now, Miss Roberta," he said rather feebly, feeling again of the silken kimona to see whether it was real. "Now tell me what you thought of all the toys I bought you."

"What toys?" said the princess, tying her golden cord into a bow.

"You shut me in that room and it was just filled with old attic things. There wasn't anything to do, so I ripped the center circle out of the coverlet on the bed and slipped the coverlet over my head. I didn't hurt it a bit, daddy, for I did it carefully with a pin and it can be sewed right in again. Then I untied the curtain cord for a sash and put the lamp shade on my head. Now may I have some lemon pie?"

The king sat perfectly still. Then his head began to shake with laughter.

"Ha! Ha! Ha! Ha! Ho! Ho! Ho" screamed the king, holding his sides.

The earl laughed as he finished his pudding and the princess laughed as she took her first bite of lemon pie, but no one but the king knew what it was all about, and that it was very fine after all to have a girl for a princess.

## HOUSEHOLD QUERIES

### Beautiful Rugs from Old Carpets

Can anyone tell me what I can do with an old faded Brussels carpet to make it presentable for another year or so, until I can go to the city on a buying trip?—Subscriber, Rohnerville.

Beautiful rugs can be made from these old carpets no matter how faded and napless they have become and they will last for many years. They are cut in strips as for rag rugs, the weaver washes and ravels them out and weaves into heavy handsome rugs that outvie the costliest velour and last almost forever. If there is no weaver doing this kind of work in the immediate neighborhood we can send address by mail to this inquirer. These rugs are really very beautiful. If old and worn the colors are merely toned down and the result is rugs of the costly neutral shades that harmonize perfectly with any room. If rugs are made of the carpet this necessitates finishing the floor by painting or staining. The household department will be glad to help with suggestions in this line.

### Sweet Pickles Shrivel

Please tell me how to make sweet cucumber pickles. How much sugar to a quart of vinegar? And mine always shrivel up so badly. What is cause? Should I soak them in salt and how long? How strong salt water, and should one use the vinegar on them hot or cold? I am a reader of your Cultivator and enjoy reading it so much. What size should the pickles be for home use?—Subscriber, Hermosa.

See answer to similar question on Page 62 of the Cultivator of July 15. Note there that pickles should be pricked in several places to permit penetration of sweet vinegar. This will prevent shriveling. Most people prefer to make sweet pickles of the small cucumbers 2 to 3 inches long.

### Dill Pickles

Can you give me a recipe for making cucumber dill pickles.—Subscriber Orange Cove.

From Cruess "Home and Farm Food Preservation:" Wash cucumbers. Prepare a crock, keg, barrel or wooden bucket. Do not use metal. Place layer of dill plant in the bottom of the container and a small quantity of mixed dill pickle spices. These can be obtained from a grocery. On these place two or three layers of small cucumbers. Add another layer of dill plant and spices and two or three layers of cucumbers, repeating the alternation of layers until the container is almost full. Cover with layer of beet leaves or grape leaves at least an inch thick. Fill and cover with a brine made of one pound salt, ten quarts water and two-thirds quart vinegar. Allow to stand until fermentation ceases (three to four weeks). Seal with paraffin. Dill pickles may be kept indefinitely by heating to boiling in the brine in which they are made and sealing boiling hot in glass jars.

### Keeping Butter

I have been a subscriber of the Cultivator for nearly a year and enjoy reading the paper immensely. How can I put up butter so it won't spoil?—Subscriber, Lodi.

It will keep well if dry salt is worked into it or if packed in brine. Use fresh sweet butter, weigh carefully and for each 10 pounds butter take 1 pound salt and work in thoroughly. Pack tightly in crocks and cover with salt. Store in cold place. When butter is to be used it may be freshened by working in cold water.

If brine is used: To each 10 pounds butter add ½ pound salt and work in thoroughly. Make brine of 3½ pounds salt per gallon water. Pack butter in this brine so that it will be well covered and store in cool place. It may be freshened as above.

## HINTS FROM HOUSEKEEPERS

### Some Comment and Suggestions

I was glad to see the recipe for strawberry clabber. If any one else has unusual recipes for the use of clabber milk or whey I shall be very grateful to see more as I am making a collection of these—so healthful we know, and the germ of the lactic acid needed to destroy intestinal bacteria. At any rate I am making a specialty of using some every day on our table. Another housekeeper gave some good recipes for using mint which I was glad to see, realinzing the need of using more "green" in our daily diet, also the value of learning of less harmful flavors and spices, so I will give a recipe that includes both whey and mint.

Mint-Whey Gravy—One large tablespoon grease or oil, 1 tablespoon cornstarch or flour, 1 tablespoon white sugar. Blend all over fire, add 1 cup whey, boiled as thick as desired, add 1 tablespoon each of chopped onion and parsley and ⅓ cup chopped mint, pinch salt. Boil just long enough to blend flavors. May have a little mint coloring if desired. Serve with lamb, potatoes or fish. The same recipe makes a lovely imitation mayonnaise dressing by leaving out the mint, and adding a little lemon juice and butter coloring and will keep a long while if much oil is used. Garlic or chives may be used also.

Try this hot with sliced potatoes, radishes and onions and poured over a bed of lettuce. Hot salads are just as good as cold and served with an omelet and desert make a full meal.

To have dry mashed turnips, carrots or squash add a tablespoon of dry flour to a quart of vegetables after draining well and mash all together. The flour takes up the balance of the moisture. After carrots are mashed this way one may add pumpkin pie spices and make a carrot pie.

I put new potatoes, also young carrots in a pail of water and whip them around with a coarse rasp for a minute and believe me, they are scraped well when I take them out.

### Maraschino Cherries

Noting directions for making the real Maraschino cherries, given by Mr. Cruess, a reader sends in a favorite recipe for making pickled cherries with Maraschino flavor.

# It's the *Result* That Counts!

IN cooking and baking, it's the *result* that counts. But—the *result* depends largely on the *ingredients.* That is why so many women prefer Watkins cooking needs; they know from long experience their quality is dependable.

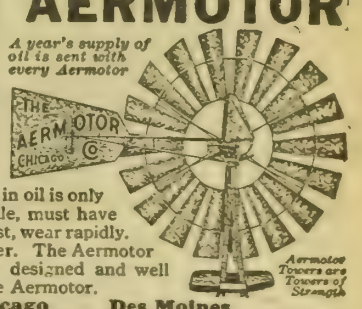
# THE AUTO-OILED AERMOTOR

## A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

*A year's supply of oil is sent with every Aermotor*



Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

*Aermotor Towers are Towers of Strength*

MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

# WAGNER'S Giant Winter RHUBARB

Plant now for February's high-priced market. Should return up to $1000 per acre first year. The California Rhubarb Association could have used the output of 1000 acres this season.

WAGNER'S NURSERY (J. B. Wagner & Son)

1550 EAST VILLA STREET Dept. C "Originators of the Giant Winter Strain" PASADENA, CALIFORNIA

They make a nice addition to a salad, or they may be used simply as a relish. Select the large Royal Ann or the deep red Oxhearts for this pickle; wash, pit and cover the fruit with vinegar and let it stand for 24 hours. Then drain the vinegar from the fruit and arrange the latter in layers in a stone jar with sugar generously distributed between them. One-half or even three-quarters as much sugar as fruit should be used. Heat the vinegar, not to the boiling point, but very hot, and pour over the fruit and sugar. Cover and let stand for a week, stirring occasionally and then add almond extract in the proportion of half a teaspoon to each quart of vinegar. If the Royal Ann cherries are the variety which you have selected for your pickling and you care to make them of deep rich red tint, resembling the bottled Maraschino cherries one buys, add also just enough red fruit coloring to produce the desired tint. But whether colored or not the cherries so prepared are a delightful embellishment to a salad.

### Lemon Ice

Make a strong lemonade of the juice of 3 lemons and 3 cups water. Add 2 cups sugar. Partly freeze 1 quart of milk, then add the juice and freeze until hard.

### Fig and Apricot Conserve

Another fig recipe that you can not beat: Put white figs through meat grinder, add ¾ pound sugar for each pound fruit and 1 teaspoon salt for 3 or 4 quarts of the mixture. Boil about 20 minutes, then add 1 cup ground walnuts for each quart (more if you have lots) boil up and seal.

Apricot Conserve—Seven pounds ripe apricots put through grinder, 5 pounds sugar and 1 medium can pineapple, 1 small handful of the pit kernels ground.—A Riverside Subscriber.

# Straloch Farm

About two years ago G. Harold Hopkins began the development of Straloch Farm which is located on the highway about two miles west of Davis. Its progress has been watched with much interest, not alone by the breeders of purebred livestock but by the farming public in general.

Those who saw the farm at its inception wonder that so much has been accomplished in so limited a time. It is devoted chiefly to breeding Shorthorn cattle, Hampshire sheep and Poland China swine, and the active management of both farm and livestock has been in charge of J. I. Thompson, formerly of the university farm.

That great care and ability was shown in the selection of the foundation animals is amply exemplified not only by the show record of last year, their first, where every entry was placed, but by the heavy demand for breeding stock the past season.

Manager Thompson in speaking of sales stated that not a bull remained on the farm older than nine months, that was for sale and that they were now making their first offering of females in 12 bred heifers. Every Hampshire that could be spared found ready market and ten could have been sold for every one that was disposed of. Forty more Poland China gilts could have been sold had they had them and the demand for boars was even greater than the demand for females. Three or four times as many boars could have been sold and at very satisfactory prices.

This certainly shows a healthy condition of the livestock industry and should be a source of encouragement and inspiration to breeders in other sections of the state.

This year's show herd in Shorthorns will consist of full strings of the two younger groups, young herd and calf herd, with a complete flock of Hampshires. Junior yearlings will be their principal showing in Poland China's, consisting of four sows and a boar, being the same animals shown last year as junior pigs. They are all by the same boar, Frisco Boy and out of the two sows, Liberty Girl 3rd, grand champion in 1920, and Black Beauty C., junior and reserve grand champion 1918 at the state fair. Fat barrows will also be shown here and at Portland, Oregon.

# Livestock News Notes

LIVESTOCK SALE CALENDAR

Shorthorns

August 9, Carruthers Farm, Live Oak.

Guernseys

August 4, L. D. Smith, Riverside Fair Grounds.

Holsteins

August 17, Jas. McGillivray, Sacramento.

August 30-31, Dispersal, Maxwell Farms, Hollywood.

Jerseys

August 20, Dispersal, W. H. Rough herd, Riverside.

The report of the Kern County Testing Association for July shows that 854 cows were tested, yielding an average of 732.2 pounds milk and 27.3 pounds butterfat. The high cow was a grade Holstein owned by B. S. Baldwin of Bakersfield which made 59.7 pounds fat from 1494 pounds milk. The hot weather has been hard on the cows, and the records of the summer months show a considerable falling off in production.

Judges who will officiate in most of the departments at the state fair, September 2 to 10, have been appointed as follows: Shorthorn cattle, John C. Burns, Texas. Herefords, James Painter, Colorado. Angus, Alex McDonald, Davis. Dairy cattle, John L. Smith, Spokane, Washington. Prof. P. M. Bandt, Corvallis, Oregon. Horse show, George A. Heyl, Washington, Illinois. Sheep, Prof. Andy Patterson, Kanhattan, Kansas. Swine, W. J. Carmichael, Chicago; C. M. Talmadge, Salem, Oregon. Poultry, Robert V. Moore, San Leandro; Chas. G. Hinds, Oakland. Pigeons, William J. Head, West Berkeley; Robert V. Moore, San Leandro. Pet stock, Lewis H. Salisbury, Pasadena. Agricultural and horticultural departments, George P. Weldon, Ontario; J. J. Fox, Berkley; R. E. Hodges, San Francisco. Draft horses, Prof. Andy Patterson, Manhattan, Kansas.

Two more splendid yearly records have been completed in the choice herd owned by Earl Graham of Compton. S. V. K. P. Lenita of Sunnyside, calving at 3 years 3 months, made 922.04 pounds butter and 20,127.2 pounds milk in 365 days. S. V. K. P. Daphne of Sunnyside, calving at 4 years 2 months, made 721.89 pounds butter and 15,770.8 pounds milk in 270 days, carrying a calf 235 days of the time. Both of these are daughters of the great Burr Farm bull, Sir Veeman Korndyke Pontiac.

The great Maxwell Farm herd of registered Holsteins will be dispersed at public auction on the farm at Hollywood on August 30 and 31. The announcement of this sale has created something of a sensation in California Holstein circles, as the moving of the famous herd to California from Iowa only a couple of years ago was taken to indicate that Mr. Maxwell would build up one of the very largest herds in California. However his Chicago business has kept him there practically all of the time and the valuable land of Maxwell Farm is right in a high class subdivision district. Many proposals for profitable subdivisions have been made but the cattle have always proved a stumbling block, and the decision to sell has therefore been made.

Princess Contenta Walker, a five

C. H. O'Connor & Son
— AUCTIONEERS —
Los Angeles Calif.

year old daughter of Prince Gelsche Walker, owned by A. W. Morris & Sons Corporation, Woodland, has completed an official record of 32.06 pounds butter in 7 days from 680.1 pounds milk, milking 101 pounds her best day. She is a most promising candidate for a large yearly record this year.

An effort is being made to assemble a California state show herd to compete at the Pacific International Exposition at Portland, Oregon, this fall. A committee of breeders representing various sections of the state will look out for likely candidates in their respective localities, and an expert judge will be called upon to pass on the comparative merits of the cattle from the various sections. It is intended to get the real line on the most promising ones at the early local fairs. President F. L. Morris of California Holstein-Friesian Association has appointed on this committee Kenneth W. Abbott for Southern California, W. J. Higdon for the lower San Joaquin, Harry V. Bridgford for Central California, and De Lancey Lewis for the coast section.

---

With 15 heifers on yearly test it looks like old times at Tulare Holstein Farm, owned by W. J. Higdon, Tulare. Most of these are first calf daughters of the famous young sire, King Korndyke Pontiac 20th, and it is a foregone conclusion that before another year rolls around he will have a most substantial list of yearly record daughters to his credit. Prince Riverside Walker is away from home for the time being, doing service in the herd of F. S. Borror & Son, Tipton. This grand old sire has a splendid lot of daughters, one of which recently made over 1,000 pounds butter in one year as a senior two year old at Santa Anita Rancho.

---

Walter F. Mitchell, Visalia, again has a herd of upwards of 100 head, that has just naturally multiplied following his sale in 1919 when all the milking cows were sold and the heifers retained. About 35 head are now in milk, including some fine daughters of Segis Pontiac Crane De Kol, Prince Hiske Walker and Sir Veeman Korndyke Pontiac. The younger things are all daughters of King Abbekerk Johanna Segis, the great son of Adirondac Wietske Dairy Maid. This bull has developed into an individual of commanding merit and his heifers are exceptionally promising.

---

The present situation in Holstein circles in California is one which may well be regarded as highly satisfactory. Never in the history of the state have there been so many prospective buyers of registered cattle. It is true that many unfamiliar with Holstein values are influenced by past unsettled conditions in other lines. But once they become convinced that prices are on the ugrade, as they unquestionably are, there will develop such a demand for breeding animals as the state has never seen.

---

Ormsby Segis Marie, formerly world record milk producer as a senior three year old, and who made over 30,000 pounds milk in one year at five years old, lately dropped a fine bull calf by Sir Toyon Fleta Johanna Mercedes, son of Cascade Fleta Johanna, second heifer of the breed to make over 30,000 pounds milk in one year. This is good news to the many breeders who admire this great cow, for she had been given up as a non-breeder by a number of good veterinarians. It is due to the patience and care of Frank Hatch, Modesto, her present owner, that she is back in breeding condition again and as she is only a young cow it is hoped that she still has a long life of breeding usefulness before her.

---

The correct figures on the three splendid records recently completed at Santa Anita Rancho, owned by Anita M. Baldwin, are now available. Anoakia Pontiac Beets 2nd, calving at 3 years 14 days made 1,158.19 pounds butter from 27,481.3 pounds milk. She is a daughter of King Korndyke Pontiac 20th. Lady Lilith Walker De Kol, calving at 2 years 8 months made 1,016.56 pounds butter from 22,876.1 pounds milk. Blanche Nudine Clothilde Walker, calving at 3 years 8 months made 960.90 pounds butter from 26,193.9 pounds milk. Both of the last named heifers are good daughters of Prince Riverside Walker, the grand old son of Prince Gelsche Walker and Aaggie Acme of Riverside, owned by W. J. Higdon, Tulare.

# EASY NOW TO RID YOUR PLACE OF FLIES

**Widely Known Scientist Discovers Wonderful Chemical That is Fatal to Flies. Not a Poison—Harmless to Stock.**

Flies are one of the most dangerous and annoying things with which the farmer has to contend. Now, through the discovery of E. R. Alexander, widely know scientist, you can rid your house and barns and livestock of these pests almost instantly, and with no trouble at all. This discovery is in the form of an organic chemical that is fatal to flies, and similar pests, such as chiggers, mosquitoes and moths.

This new discovery, which is called Alexander's Rid-O-Fly, is not a poison. Though it kills flies like magic, farm animals and human beings are not affected by it at all. In addition to killing these insects, Rid-O-Fly is a strong repellant. Flies will not come near stock or buildings where Rid-O-Fly has been used. Rid-O-Fly is particularly valuable for cows and horses, as it is a known fact that flies do untold harm to these animals.

So confident is Dr. Alexander that his discovery will rid your house, barns and live stock of these pests that he offers to send a $2.00 supply for only $1.00 on the guarantee that if Rid-O-Fly does not solve your fly problems it will cost you nothing. Two big Kansas City banks guarantee the reliability of this offer.

SEND NO MONEY—just your name and address to the Alexander Laboratories, 1577 Gateway Station, Kansas City, Mo., and this introductory offer will be mailed at once.

# A Wonderful Opportunity to Buy Clean Registered Holstein Heifers

Never before in the entire west have so many registered Holstein heifers been offered in one sale, and the offering affords a choice such as comes very rarely.

COMPLETE DISPERSAL
140 — REGISTERED — 140
## HOLSTEIN HEIFERS

WILLOWMEAD HERD, Sacramento, Calif.,
Owned by Jas. McGillivray

**Thursday, August 17, at 9:30 A.M.**

These heifers are from one of the longest established California herds. It will be remembered that a few years ago when Mr. McGillivray was increasing the size of his herd through purchase, he appeared several times as a buyer of $1,000 females, at a time when those were top prices. Only the highest class herd bulls have ever been used, and the heifers in this offering represent a long time of constructive breeding.

KEEP THIS IN MIND!

These heifers have been raised on milk from tuberculin tested cows, turned into clean pastures at weaning time, and in testing for this sale only one reactor out of 175 was found, that one a calf lately brought over from another ranch. And in addition to that every heifer over six months old is sold tuberculin tested and subject to 60 day retest by the buyer.

UNIFORM BREEDING

The entire 140 head in the offering are sired by just eight bulls, permitting a selection of uniform breeding. Of these approximately 100 are sired by just four bulls, Colony Zarilda Newman, whose dam has twice made over 1,000 lbs. butter and over 30,000 lbs. milk in one year; Prince Echo Sylvia Segis, sired by the greatest proven son of May Echo Sylvia; Yolo Valdessa Hengerveld, a 30 lb. son of the 41 lb. bull King Valdessa; and Yolo Mead Paul, one of the good sons of King Mead of Riverside.

THIS IS THE OPPORTUNITY OF YEARS TO BUY CLEAN HEIFERS OF POPULAR AND HIGH RECORD BREEDING. NONE ARE YET IN MILK, BUT SOME ARE SPRINGERS, ABOUT 100 SELLING OPEN.

**Place of Sale:** On the main highway between Sacramento and Stockton, about 12 miles south of Sacramento. Watch for sign on highway.

**Headquarters of Sale:** Travelers Hotel, Sacramento, from which point transportation will be afforded out of town buyers morning of sale.

# Milking Cows for Profit

By Jack Klein

SOMEHOW as one travels about the state and visits with the dairymen he gets the idea that, although they are in the dairy business for what they can get out of it, they are not just sure that it is a business which they can expand beyond a certain place and therefore the profits to be made are limited. Only a few days ago a noted educator along agricultural lines in an address voiced the opinion that the backbone of the dairy business was the family herd which was just large enough to be cared for by the members of the family as a side line to the general farming operations. It is true that this kind of a herd is the most profitable because labor and overhead expenses are seldom figured, but it is on the big commercial herds that the cities have to depend for their milk supplies. These herds are necessarily operated at a greater expense than the small ones. They must be carefully supervised if they are to last, and the frequent failure of such a herd to make good has led people to think that the risk is too great. Generally the failure is due to mismanagement or misjudgment more than to any other factor. The business is of necessity run on a small margin of profit and must be administered severely.

Out in the San Fernando valley near the city of Los Angeles H. E. White is operating a large dairy herd on a 300 acre farm and making money. He is admirably situated from a shipping standpoint and the land, much of which was formerly a willow covered slough, has proven exceptionally fertile. Seventy acres in alfalfa provides sufficient hay for the herd of 330 high grade Holsteins. The barns are situated on a knoll and the water used to wash the barns is all carried out on the alfalfa. Pipes used to distribute it are moved about frequently, and there is no danger of burning the alfalfa nor of drowning it. The soil is sandy and the fertilizer thus applied is invaluable. The land yields seven cuttings of alfalfa a year and an average of nearly two tons per cutting to the acre. A considerable portion of this can be sold as rabbit hay at a price very much above the market for dairy hay and the owner finds it profitable to sell some of his product and buy feed for the cows.

Although he owns 300 acres Mr. White has but about 200 available as the balance was under lease when he purchased it and he will not be able to use it until next year. The 125 acres other than the land planted to alfalfa yielded a fine crop of oat hay this spring which is used for the young stock and dry cows. It is now planted to silage corn and if it yields up to its usual amount will turn off about 18 tons to the acre. Silos of sufficient capacity to care for the entire amount stand ready to receive it.

Mr. White has gathered together a herd of big cows of exceptional individuality and they are repaying him for his trouble in selecting them. Nearly all are heavy milkers and his herd averages 4 per cent in fat. All of the cows are tested in the Los Angeles County cow testing association, and for the year ending June 30 last the average production was 418 pounds fat per cow. This was a gain of 19 pounds a cow over the previous year's average. The five high cows of the herd had an average of 637 pounds fat.

Of the 330 head 182 are cows in milk and they yield an average of about 6800 pounds of milk a day. This is sold at the wholesale rate of 90 cents a pound butter fat or $3.60 a hundred for 4 per cent milk and the monthly milk check amounts to something over $7500.

The equipment on the White ranch is adequate for the production of grade A milk under the strictest supervision in the country, but is not expensive. His milking barn is regulation width, two rows of 30 stanchions each. One side is given over to the heavy milkers which are included in two strings of 30 cows each and are milked three times a day. Two milkers feed, milk and clean after each string of cows. The hours are arranged so that cows are being milked nearly all hours of the day and night as the two time strings of 30 cows each which make up the balance of the herd are alternated on the other side of the barn. Experience has taught that milking three times a day causes a cow to produce more milk and to hold up longer than under the two time method. A cow which started off at 80 pounds a day was recently taken out of the three time string in her tenth month and only five weeks away from calving still giving 65 pounds a day.

Mr. White is adding another row of stanchions to his barn in preparation for 70 heifers which will freshen this fall. With 90 stanchions available he will be able to milk 300 cows following his method of stabling.

The cows are given all the alfalfa they can eat in the corral and in the barn are fed silage and wet beet pulp with a grain mixture much the same as has been advocated in recent feeding articles in this paper. The mixture is fed in proportion of one pound grain to 4 pounds milk. If possible the cows are allowed 8 weeks of rest before calving.

The milk house is large and well equipped. The milk is cooled by brine which is kept at low temperature by a compact two ton ice machine which is operated by a 3 horsepower motor. The brine tanks are inside the big ice box and hold it at a temperature around 32 degrees. The cost of operation of this machine is about $5 a month. Before it was installed Mr. White paid out over $100 a month for ice which failed to provide sufficient refrigeration to do the work and he figures the ice machine a big saving.

### Uses Good Bulls

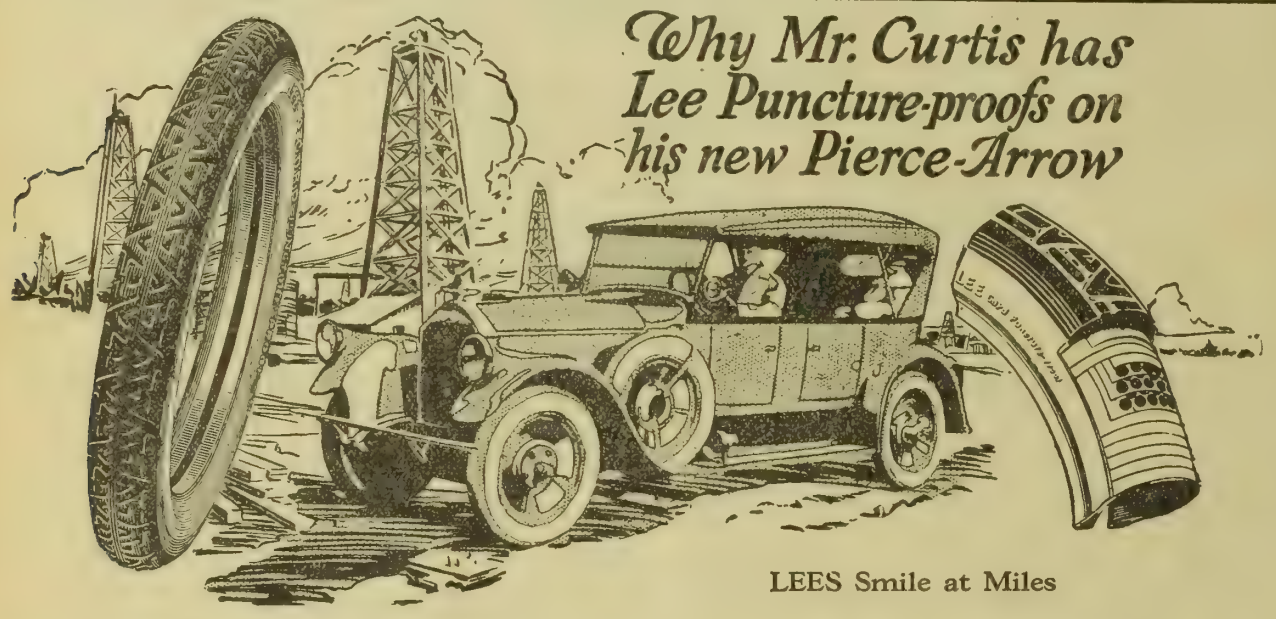
Mr. White is increasing the value of his herd by the use of the best pure bred Holstein bulls he can buy. At the head of the herd is a son of King Marco Alcartra out of a 100 per cent full sister of Miss Valley Mead De Kol Walker. This bull formerly headed one of the big pure bred herds of Southern California.

Two young bulls were recently purchased from Fred Hartsook of Lankershim. One is out of Ciruela Juliana De Kol, a junior two year old who made 732 pounds butter last year, and the other is sired by Hazelwood Finderne Fayne and out of the 900 pound record cow, Henrietta Roderick. All three of these bulls are splendid individuals and will help the type of the herd.

Here is a dairy farm, depending entirely on the sale of milk and a small amount of hay and fertilizer for its income, making a handsome profit for its owner. It sets at rest all rumors that a big herd cannot be run profitably. It can be done if it is done right and small herds given the same treatment will yield proportionately greater. Everyone should follow Mr. White's lead and get into the business in such a way that there is no need to worry about finances. Plan carefully and work hard and success is sure to come.

### LOS ANGELES COUNTY FARM BUREAU COW TESTING YEAR CLOSES

The cow testing year of the Los Angeles County farm bureau association closed on June 30 and the new year started July 1. Much interest has been evident in this work throughout the year with an increased number of members. More cows are under test than ever before. There has been much interest in the county dairy cow competition maintained in connection with the testing association. There has been special interest in the sweepstakes cup which is awarded to the dairy winning the greatest number of points in the monthly and yearly classes. At the present time at the close of the year's work the monthly classes show Fred Hartsook to be in the lead with 90 points, Maxwell Farms being second with 69 points, Arden Dairy third with 68 points, and



*Why Mr. Curtis has Lee Puncture-proofs on his new Pierce-Arrow*

LEE *Puncture Proof Tires*

LEE

*"I cannot pass this opportunity to tell you of the wonderful service and mileage received from Lee Puncture-proof Cords put on my 5500 pound FIAT touring car, over a year ago. I drive this car all over the Kansas Oil Fields, in all kinds of weather and over all kinds of roads and have ye to be delayed by any kind of tire trouble, and the speedometer shows that they have been driven 11,298 miles. So, you can see why I equipped my new Pierce-Arrow with P. P. Cords."*

IN this letter, Mr. Ed. T. Curtis, of Curtis & Wells, Kansas City Live Stock Commission Merchants, sums up the feeling of security enjoyed by Lee Puncture-proof tire users, everywhere.

Lee Puncture-proofs are the only pneumatics especially adapted to automotive equipment on the farm. Every farm vehicle, including passenger car and truck, is used for business, and it has long ago been proven that every business car gains efficiency from Puncture-proof tire equipment.

Even the regular Fabric and the Cord tires of Lee manufacture are of exceptional quality—equal to the best the market affords.

The Lee Dealer will demonstrate the safety and saving advantage of this different type of pneumatic—show you why it carries a cash refund guarantee against puncture.

E. L. White, Burr Farms, Santa Monica Dairy, Adohr Stock Farms and County Farm running a very close race. It is impossible to tell from these figures, however, who will be winner as the yearly classes count a great many more points than the monthly classes. The annual report of the cow testing association is about completed and will be published in the near future. It will announce winners in all yearly classes and will also announce the winner of the sweepstakes cup. These 29 beautiful loving cups will be awarded to dairymen winning them at the annual meeting of the Los Angeles County farm bureau in the early fall.

A dairy cow competition has been lined out for the new year which will have two more classes than formerly and will allow a wider distribution of prizes among dairymen of the county. All men who are interested in testing should get in touch with the farm advisor's office in the court house at once so that they may get a full year's work.

## REASON FOR OPTIMISM

**By R. M. Hagen, Secretary California Cattlemen's Association**

Because of high costs of production and relatively low price of cattle many cowmen have become somewhat discouraged over the future of the industry. Within the past month of two, a number of cattlemen have seriously discussed with me the possibility of going out of the business.

It is these confidential talks which make it seem worth while to put in writing some facts which seem to indicate that better times are ahead for the cattleman. It seems to be a rule that conditions look most discouraging just before they begin to improve.

A study of the economic conditions influencing the cattle business would seem to indicate that we are at the bottom of the depression and that the next seven or eight years should be an upward climb in advancing prices and more especially in the profits from the cattle business. We have been saying for some time that cattle have hit the bottom as a result of the financial pressure of 1920 and 1921 and that the actual price of cattle will not go to lower levels. We still believe that is true. We believe that the shortage of cattle will keep up the price of breeding stock and that there is a sufficient shortage of actual beef so that with the meat councils which have been organized at centers of population, increasing the demand for meat, and with the National Livestock and Meat Board collecting funds for the national advertising of meat, we will very shortly experience a real shortage of beef cattle compared with the stimulated demand.

A study of cattle prices for the last 75 years shows that beef prices were high in 1871, 1885, 1900 and 1919. Beef prices were low in 1877, 1895 and 1909. It will be noted that there seems to be a regular fluctuation in periods of 15 years. This being the case, cattle should again be at a relatively high price in 1930, and conditions should steadily improve between the present and that date.

We need not depend entirely however upon any law of chance or law of averages, but there are plenty of facts which substantiate this belief and which make it appear reasonable and logical.

Costs of production are being reduced, costs of marketing are being reduced, the supply is admittedly short, and there are several agencies at work increasing the demand. We believe that the cattle industry is now in the period of greatest depression and that each of the next few succeeding years will show considerable improvement over the year previous.

This is by no means the time to go out of the cattle business, but on the other hand is the time to buy cattle and stay with the business. Constantly, however, there must be exercised good judgment and good management. The quality of cattle produced must be improved. Every economy must be practiced, but there is reason for optimism.

# BEFORE YOU BUILD A FENCE
## READ MY BOOK
## IT'S FREE

**I have made a real study of fences. Wherever I go the first thing I look for is fences. I have talked to farmers everywhere about their fences. I know what they are up against. I have worked out their problems for them. I have saved them real money by giving them practical information about fences. You, too, can have this information free. I will work out your fence problems if you will write me about them. In the meantime, read my book, "Fencing Facts for Farmers."**

## Every Farmer Should Know
## These Facts About Fences

*How to build a serviceable fence that will increase the value of your farm.*
*The comparative value of steel and other materials in fences.*
*Why a farmer lost $750 through his fences.*
*Which takes more fence material, a square or rectangular farm?*
*How a steel fence can increase a farmer's bank account.*
*Which is the strongest fence post in the world?*
*Why wood fence posts are a thing of the past.*

### THE ORNAMENTAL GARDEN FOR AUGUST IN NORTHERN CALIFORNIA

(Continued on Page 125)

and as soon as the seedlings are large enough they must be transplanted.

**Lawns**

These must not be neglected with regard to watering and any dry spots will soon spoil the appearance of any lown if sprinkling is not carried out evenly and regularly. Attention must be given to weeding also. A good dressing with dried blood or decomposed lime shell will help to maintain a good color in the lawn.

## Southern Arizona

By M. E. Bemis

LATE frosts make it possible to plant some of the annuals which in the eastern part of the United States are commonly planted in the spring. One of these many possibilities is the hardy, easily grown flower called the cosmos. These sturdy plants grow to a height of four feet and over, making them most effective for garden walks. The flowers are beautifully colored and of dainty daisy like appearance and the feathery foilage gives a very pleasing effect. This is a plant that loves the sunshine, hence, no shade is needed and comparatively little care.

The phlox is another plant which makes quick growth in the southern sunshine. Its variety in color, its quick growth and hardiness all help to make it attractive for late summer planting. It reaches a height of about one foot, making it particularly useful for ribbon garden beds of contrasting colors, and it is also suitable for borders. It is also useful as an undergrowth for tall, bare stemmed plants.

The zinnia is the most easily grown of all summer plants for Arizona. August is not too late for planting.

Of all flowering plants perhaps there is none that comes nearer to being a universal favorite than the sweetpea. Here in Arizona we can have the flowers of the sweetpea almost continuously from November to July. The so-called Christmas flowering sweetpea may be planted in the latter part of August. If planted in rich soil, well cultivated, and irrigated frequently, it will begin to bloom in the latter part of November. It will stand only a limited amount of frost, hence for continuous blossom throughout the winter must be protected. These are now grown in such great variety that the most exacting may have his choice of colors.

# This Month in the Vegetable Garden

## Northern California

By A. R. Gould

MANY crops will be ready for harvest this month, chief of which will be potatoes, onions, corn, beans, carrots and beets. These should be cleaned and stored in a dry cellar or barn and the root crops such as potatoes, beets, and carrots may be covered with sand and kept dry. Corn and onions may be hung up or laid out on mats while the beans should be shelled for use in the winter. As these crops are cleaned off the plots should be limed and dug over ready for later planting.

Some careful thought must be given to irrigating this month. Such crops as lettuce, turnips, leeks, celery, beans and corn should all be given a good supply. During the hot dry weather a considerable amount of water is lost by transpiration through the plant itself and also through evaporation from the soil.

**Lettuce**

May King and Los Angeles may be sown thinly in rows. Those sown last month should be now thinned out to six inches apart and irrigated, this being followed up by the use of the cultivator.

**Leeks and Celery**

These should now be getting well established in the trenches and the soil will need cultivating between the plants. About the end of the month a liberal watering with liquid manure should be given. Careful watch must be kept for cutworms.

**Corn**

Make a sowing of Country Gentleman and Golden Bantam which will come in for use late in the fall. Sow two or three seeds about 2 feet apart in the row which should be three feet apart. Cultivate and irrigate between the rows of established plots and frequently dust with dry lead arsenate the tassels of maturing crops to destroy the corn worm.

**Beets**

A sowing of Detroit Dark Red and Crosbys Egyptian may be made for a successional supply in fairly rich soil in rows 2 feet apart.

**Tomatoes**

This is one of the most important of crops and is fairly easy to grow when grown on a soil retentive of moisture. Very large acreages are grown for canning in Santa Clara Valley and in Alameda County. If these plants are allowed to ramble they need very little attention but if trained to stakes they will require tying up and the lateral shoots pinched out. A watering with liquid manure weekly after the fruit has set will prove very beneficial. At the first appearance of aphis spray with black leaf 40.

**Beans**

Make a sowing of Canadian Wonder and Golden Wax for late fall supply and sow in rows 2 feet apart. Keep the cultivator busy between the rows of those sown last month and thin out the seedlings, leaving the plants one inch apart in the row. Collect all beans now matured and put away after drying for storage.

**Cauliflower**

Secure strong plants of these for planting out in well prepared soil which should be heavily manured. Plant 18 inches apart in the row the best varieties, Autumn Giant and Early Snowball.

**Onions**

These will be ready to harvest as the tops become yellow, and they must be pulled and dried in the sun before putting in storage. Such long keepers as Australian Brown and Prizetaker will then be safe for winter use.

**Kale and Brussels Sprouts**

These useful green crops if sown as advised last month should be ready for transplanting about the end of the month on a well prepared plot which should be well irrigated before the plants are put out. Plant at least 18 inches to 2 feet apart in the rows which should be three feet apart.

**Squash, Melons and Cucumbers**

If the squash bug is troublesome dust with lead arsenate frequently and cultivate carefully around the roots of each plant.

**Strawberries**

The everbearing will need a continual water supply if the crop is to be maintained, and a dressing with dried blood and bone meal will be very helpful just at this time.

## Southern Arizona

By M. E. Bemis

AUGUST is really the beginning of the fall garden activities. There is always some trouble with germination of small seeds while the nights are still warm as they are likely to be through the greater part of the month, but the early start, especially for the home garden, is worth the effort. After all seeds are not so very expensive, and if the first planting fails it is not so serious. The commercial gardener can hardly afford to take too long a chance on losing both time and seed although the early vegetables bring prices that are compensatory for considerable extra cost.

The list of plantable things is:

Plenty buildings, two artesian wells, one pumping plant. Can be leased for term of years at fair rental, part of which can be paid in labor. Possession of buildings and part of land any time. W. F. Marks, 1318 West 3rd street, Los Angeles. Phone 52471.

## PAINT

ROOFING PAINT

ONLY 15c A GALLON

ASPHALTOID SAVES YOUR ROOF

Best roofing and preservative paint under sun sold direct to you by the manufacturer for only 15c a gallon. Write for particulars and free sample. Woolner Oil Co., 4th and Commonwealth, Los Angeles, Calif.

Beans, beets, cabbage, carrots, cauliflower, cucumbers, kohlrabi, kale, lettuce, onion seed, parsnips, peas, turnips and corn for roasting ears.

Table beets for the family garden should be planted in rows 18 inches apart, and most gardeners here prefer to plant on the sides of ridges just above the water line. Where the rows run east and west, if the seeds are planted on the north side at this season of the year there is probably some advantage. Beets should not be covered more than one inch deep, and when plants are well developed they should be thinned to six inches apart. Crosby's Egyptian and Extra Early Eclipse are favorites. A row or two of Swiss chard should be planted, many people use the green leaves for cooking like spinach and the stalk like asparagus. It will stand cutting back frequently. Probably the principal use of Swiss chard here is for green feed for the chickens. Some use stock beets for this purpose and grow a few rows in the garden of both spring and fall plantings.

Beans should be planted in August and September. The Pink bean, or Frijole, is becoming a favorite with many American people who have learned of their Mexican neighbors the excellence of this variety. This should be planted at once. John Schlolas recommends planting on level ground, with plenty of moisture in the soil, an irrigation just as the plants are breaking through, and frequent irrigations after, with cultivations following each irrigation. Other varieties that do well here are Burpee's Bush Lima, King of the Garden Pole Lima, Kentucky Wonder Pole Bean, Scarlet Runner Pole. Burpee's Stringless Green Pod, Improved Yellow Six Weeks and Improved Golden Wax.

Cabbage and cauliflower seed should be planted in beds for transplanting later. These should, of course, be of rich soil and well shaded. Varieties of cabbage that have been proved here are Early Winningstadt, selected Early Jersey Wakefield, Danish Ballhead, Selected Early Flat Dutch, and Selected Late Flat Dutch. Cabbage is easily grown and should have a place in the home garden, although owing to heavy transportation costs it is not probable that for some time to come cabbage will become of the commercial importance here of lettuce and some other crops. Henderson's Early Snowball cauliflower is recommended.

Parsnips are sown much like beets except that the seed should not be covered more than a half inch deep. The Hollow Crown is the best for this vicinity. Peas should not be planted until the latter part of the month, and unless there are some cool nights probably it is better to wait until September, alhough the advantage of a good start makes the effort worth while on a small scale. The early varieties are the ones to plant for fall maturity, such as American Wonder and Alaska. These varieties may be planted 18 inches apart in drills. Early plantings should be covered rather more deeply than the later or winter plantings.

(Continued on Page 143)

# REMCO TANKS

We will ship you, immediately on receipt of order, any standard Remco tank of the dimensions or capacities shown below at the prices here listed:

WATER AND OIL TANKS
Made from 2-inch Clear Air-dried Redwood

# Poultry Queries

Conducted by Jean A. Koethen

### Nux Vomica for Lice

We have been advised to feed nux vomica to our chicks to control hawk activities, and have been told that hens would be freed of all vermin if fed nux vomica about twice a year. We tried this on some of our chicks and the lice disappeared but the hawks came just the same. If any one has tried this remedy I would like to know the exact proportions to use, and whether the drug should be in powdered or liquid form. If feeding hens nux vomica will keep them clean of all vermin, why is it not more generally used by poultrymen?—Subscriber, St. Helena.

I have not heard before of the use of nux vomica for ridding fowls of lice, and should not dare to recommend it, because nux vomica contains strychnine, and while a little might have apparently no ill effect, in the long run it must be harmful. We should be very glad to hear from others who have tried it. I do not see how the use of anything internally could keep hawks away.

### Ticks

What remedy can I use in a wooden chicken coop, around old boards, cracks and crevices to get rid of chicken ticks?—Subscriber, Dinuba.

In theory any insecticide that is strong enough to kill mites will kill ticks also, but in practice the latter are very hard to get rid of. They crawl into cracks or through them, and the insecticide must be used again and again on both sides of every board, and must be sprayed, if possible, into every crack so that not a tick escapes. A five per cent solution of creolin, cresol or zenoleum will kill ticks if it reaches them, and painting with carbolineum or with crude carbolic acid and kerosene, using one part acid to four of kerosene, is effective, but as long as you fail to reach every tick your coop will still be infested. Boiling water is certain death to all these pests, and so is corrosive sublimate, but only their persistent use will eradicate ticks.

### Diseases of Poultry

Can you tell me the name of a book devoted exclusively to poultry diseases?—Subscriber, San Leandro.

Kaupp's "Poultry Diseases" published by the American Journal of Veterinary Medicine, Chicago, is the best I know. "Poultry Culture, Sanitation and Hygiene," by the same author, published by the W. B. Sanders Company, New York, deals largely with diseases and their prevention and treatment. I do not know the price of either. "Important Poultry Diseases," which may be had free from the department of agriculture, Washington, D. C., gives some of the most common and necessary treatments in very condensed form.

### The Persistent Tick

Is it possible to eradicate ticks in a hen house? Have been using kreso dip, crude carbolic acid, kerosene and water every day. Also use hot soap suds with above solution once a week. I wash, move all roosts, pour into every crevice all over the house. Have done this for two and one-half weeks, and when I stopped for two days the ticks accumulated. Have thought to whitewash.—Subscriber, San Miguel.

Please note reply to Dinuba subscriber. It may be you are not using the insecticides strong enough. If you can get crude carbolic acid of full strength, which is not always possible, and mix it with four parts kerosene, or even a stronger solution, and paint on with a brush, you will kill every tick the preparation touches. You can use crude carbolic acid alone if you wish. It is only a question of expense. For most purposes a solution of one to four or five parts kerosene is strong enough, but a house full of ticks is a hard proposition and demands heroic treatment. When an old house and the ground around it are full of ticks fire is the only certain remedy. If you use whitewash add a little crude carbolic acid.

### Roupy Turkeys

Is there a cure for swelling around eyes of turkeys? They seem to linger and are quite lively.—Subscriber, Maxwell.

Your turkeys have swellhead, or roup, due either to lack of sufficient fresh air at night or to a roupy taint in the blood. Turkeys that roost in the open rarely have roup. When they have there is no explanation but that of inherited tendency. If the swellings are hard and seem to contain pus they should be opened and cleaned, first with a 20 per cent solution of baking soda, then with peroxide of hydrogen. After the second cleaning inject a little of this mixture: Oil of thymol, 1 dram; oil eucalyptus, 20 drops; oil of petrol, 2 ounces. Do this twice a day till there is improvement. A simpler remedy is to dip the head in a weak solution of potassium permanganate, just a few crystals in a quart of water twice a day, first massaging the nostril toward the eyes in order to loosen the secretion.

### Sudden Deaths

I am losing some of my hens this hot weather. Feathers around the head drop off and head is very red. They seem healthy but drop off suddenly.—Subscriber, Bakersfield.

As I am not told the breed of these hens nor how they are fed I can only conjecture that they are overfat and therefore very easily overcome by the heat. That redness of head and loss of feathers is frequently characteristic of fat old hens. The only remedy is a lighter ration, with abundance of shade and fresh water always at hand. Feed all the greens possible. If you have alfalfa range put the birds on that for awhile and feed little or nothing else. Make the mash half bran or even all bran for a week or so, and give no grain but a little wheat or oats at night. If the hens are molting a short fast will help them to drop their feathers quickly, then a return to the regular laying ration encourages rapid growth of the new plumage. In the interior valleys of California no corn should be fed during the summer.

### Carbolic Acid for Swellhead

My little turkeys have taken cold and have large swellings under the eyes. These are filled at first with mucus which finally becomes cheesy. We open these pouches and swab daily with a 10 per cent solution of carbolic acid. Is there something better than carbolic acid for cleansing these openings?—Subscriber, El Cajon.

Peroxide of hydrogen is better. Dr. Kaupp recommends washing first with a solution of baking soda, then with peroxide, and finally with a mixture of oils. (Note reply to Maxwell subscriber). I think even a warm boric acid solution would be better than the carbolic acid.

### Bowel Trouble

Occasionally I lose a hen with diarrhoea. Feces stick to vent, which becomes sore and raw, and the bird becomes very thin.—Subscriber, El Cajon.

I believe I would kill those hens as soon as they became ill. The trouble may be due to indigestion merely, but that soreness around the vent is a symptom of vent gleet, a far worse disease that ordinary diarrhea, and one which is very difficult to cure. See that the flock has an abundance of green feed and that the ration is lighter than usual. Vegetables and fruit and melons are a wholesome addition to the summer ration, and milo and corn should be avoided.

### MANY WOMEN ENROLLING IN POULTRY SHORT COURSE

Women in increasing numbers are enrolling for the poultry short course which is held each year at the University of California Farm at Davis. Poultry farming represents probably fewer difficulties to women than any other branch of agriculture, and the short course provides the training and instruction necesary to practical success. One of the leading poultry keepers of Niles is a woman graduate of the course of 1918, and a woman student of the 1920 course has made not less than $1200 in eight months.

The poultry short course for 1922 will begin at the University of California farm on October 2 and will cover a period of six weeks as usual.

# Lice Kill Chickens in Warm Weather

**Summer Months Most Dangerous, Says Poultry Authority—To Prevent Losses Add Minerals to the Fowls' Drinking Water**

If your chickens are sickly, won't lay and are dying off in hot weather, lice and mites are probably the cause. Dr. B. F. Kaupp, famous poultry authority, says: "Lice are most common in July and August. During these months conditions are more favorable for their propagation." To easily get rid of these pests and prevent losses, add minerals to the fowls' drinking water. This does away with greasing, dusting, spraying and dipping. Soon after the fowls drink the mineralized water all lice and mites leave them.

The necessary minerals can now be obtained in convenient tablets, known as Paratabs. They are scientifically prepared, perfectly safe, and dissolve readily. The tablets also act as a tonic conditioner and are warranted to impart no odor or flavor to eggs or meat. They are equally beneficial to young chicks and grown fowls. The health of the fowls improves, they grow faster, stand hot weather better, and the egg yield frequently is doubled. Mrs. M. N., Pulaski, Ky., says: "I am giving Paratab water to my chickens and am having better luck this year than ever before."

Any reader of this paper may try Paratabs without risk. They cost only a trifle and are sold under an absolute guarantee. Furthermore, the laboratories producing Paratabs are so confident of good results that to introduce them, they offer two big $1 packages for only $1. Send no money, just your name and address to the Paratab Laboratories, Dept. 959, 1100 Coca Cola Bldg., Kansas City, Mo., and the two $1 packages, enough for 100 gallons of water, will be mailed. On delivery pay the postman only $1 and postage. If not delighted with the results in 10 days, notify the laboratories and your money will be refunded in full. Don't hesitate to accept this test offer, as it is fully guaranteed.

# Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. Careful attention to every order, large or small. Send today for prices.

### Piping Ditch

Have owners of an open ditch the right to pipe such a ditch without the permission of the owner of the land through which the ditch runs? The ditch has been in existence for over 50 years.—Subscriber, Springville.

It has been held in cases almost parallel with the above that the owner of the right of way can not make any material alterations, although no damage results in consequence, or even if they might be beneficial. This may, however, depend upon the character of the original grant. If the grant was given in general terms for a right of way to conduct water it is conceivable that a party might have the right to conduct the water in whatever way he saw fit. If his right depends simply upon prescription, then he has no right to make any change.

### Pipe Line

Adjoining owners agreed to build a pipe line upon the division line. One of the owners induced the contractor to lay the pipe line entirely upon the other owner's land during his absence and so that the line would not run close to the first party's trees. No contract for the laying of such pipe line has been recorded. What are the rights of the parties?—Subscriber, Santa Fe Springs.

Apparently there was some written contract to the effect that the line would be laid on the division line. In that case the party upon whose land it was wholly laid may require the other party to remove the line and place it in accordance with the contract and he would be entitled to collect whatever damages have been caused by the violation of the contract from the party who caused it to be laid elsewhere than the contract called for. As the line is wholly upon the property of the one man who did not desire it to be there and it was placed there wrongfully by the other party, the party upon whose land the line lies could with entire justice refuse to permit the other party the use of the line. The damages, of course, would embrace the rental of the land and any damage which was caused by reason of the taking of more land than would otherwise be required, as well as the fact that if he permits the first owner to use water through the line the party wrongfully placing the line upon his land undoubtedly would acquire a perpetual right of way at the expiration of a period of five years.

### Joint Bank Account

There was an account in a bank upon which my deceased father and stepmother had the right to draw. Neither the bank nor stepmother will state the amount in this deposit. How can it be ascertained?—Subscriber, San Fernando.

Letters of administration upon the estate of the deceased father could be petitioned for but the wife would have the prior right for such letters. In case letters were issued to her the son would undoubtedly have the right upon proper petition to require the wife or the bank to show the amount of any deposit in the bank on the theory that it was a part of the estate.

### Canning Goods to Sell

What, if any, are the requirements of law pertaining to canning of fruit and selling of produce?—Subscriber, Santa Rosa.

In case the canning and sale is conducted wholly within the state of California the federal pure food laws would have little or no effect. The only provisions with respect to California laws are to the effect that the product shall be in no wise adulterated, mislabeled or misbranded.

### Homestead to Surviving Spouse

Several years ago I homesteaded my place upon which I resided with my wife and three sons. In the case of the death of myself or wife can the eldest son obtain an interest in this property?—Subscriber, Hemet.

In case the selection of the homestead was from community property then upon the death of either the husband or the wife the whole of the property vests in the survivor. The children, therefore, have no interest in the property but it is subject to disposition either by sale or by will of the surviving spouse.

## ASSOCIATION CONTRACTS UPHELD BY COURTS

The first decisions in suits brought by the California Bean Growers Association against recalcitrant members have resulted in a complete victory for the association. On July 17, Judge J. E. Plummer, of San Joaquin County, handed down three decisions in cases wherein the association was plaintiff and Rindge Land & Navigation Co., K. Hortai and M. Swada were defendants.

Judge Plummer decided that the association was entitled to collect one cent for each pound of beans of the 1919 and 1920 crops which the defendants failed to deliver to the association. This amount represents the liquidated damages provided by the members' agreements. In the Rindge case the liquidated damages amounted to $14,560; in the Hortia case, $900, and in the Swada case $501.40.

By a peculiar coincidence, Judge Plummer had prepared his opinion a day or two before the supreme court of this state handed down its decision in the case of Poultry Producers of Southern California vs. Barlow. In the latter action the supreme court had squarely presented to it the issue involving the right of a cooperative association to collect liquidated damages from a non-delivering grower member. The supreme court unanimously held that a cooperative association was clearly within its rights in collecting such damages. Judge Plummer's opinion reached the same conclusion.

The Barlow case definitely determines the law of California. It will be binding authority in a number of actions now pending throughout the state wherein liquidated damages are sought in similar cases.

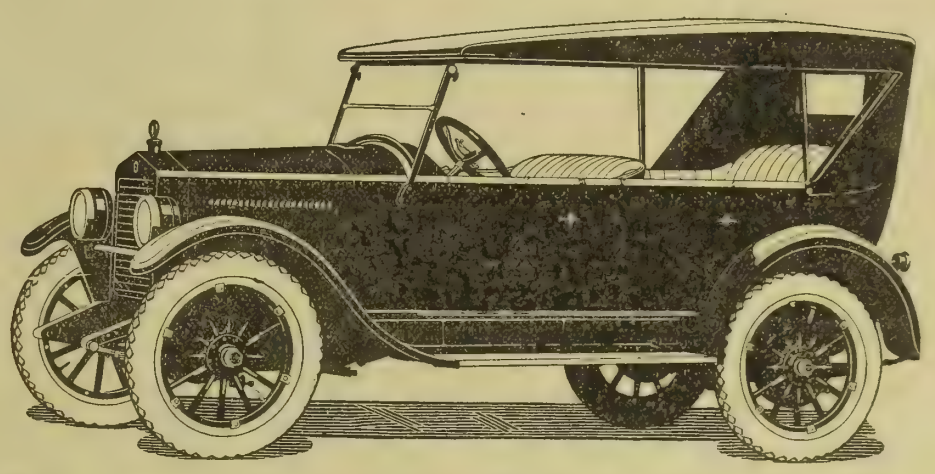
## DISTRIBUTES FARM FILMS

A new distribution center for American Farm Bureau motion pictures has been established at San Francisco. In cooperation with the California Farm Bureau Federation, Grant W. Kenney of the department of visual instruction of the university extension department, has opened an exchange at 105 Montgomery Street, San Francisco.

Mr. Kenney will have copies of all pictures in the American Farm Bureau library and will offer them to county farm bureaus, churches, schools, community clubs and other organizations. The new exchange will distribute in California and in surrounding states as well.

During the week ending July 15 the Tulare County farm bureau sold 20 carloads of grain, mostly wheat. Price received was $1.65 to $1.78. per hundredweight f. o. b. shipping point.

$1095



A New ESSEX

A Roomier Open Car—A Greater Chassis

You can have no appreciation of what this price buys until you examine and drive it.

To all that made Essex such a wonderful value in the past are added refinements and comforts never before offered in a car of its price class. Roomier seating, wider doors and greater riding ease, contribute something new in personal comfort.

smoothness is even more pronounced. You will instantly note its greater beauty. Its care and attention are easier, cleaner, more convenient.

It will reveal a charm you never suspected in any except the large costly cars.

The Result of Three Years' Experience

Back of the new Essex is all we learned in building 70,000 earlier Essex cars. Finer precision standards have resulted and Essex

Wider Seats
Wider Doors
Lubricated with an oil can—no messy grease cups.
Thief-proof Lock, reduces insurance cost 15% to 20%.

It Improves in Service

Old owners tell you of a car so enduringly designed and built that its performance improves for thousands of miles.
But today's Essex combines advantages no earlier owner knows. Go see, and ride in it. It is the best Essex ever built, and at the lowest price.

Touring, $1095 Cabriolet, $1195 Coach, $1295

Oranges: Demand moderate, market steady. Valencias, special brands, 9.50@10.50.

### HONEY

The nectar flow from orange has now finished, and the flow from sage is nearly over. Orange yield is reported light to fair, sage flow generally good. Fair eucalyptus flow being secured in Alameda County. Bees in Southern California said to be now gathering mostly alfalfa nectar. Beekeepers are busy extracting. Old crop practically exhausted. Demand light and market dull. Few sales reported. Carload f. o. b. usual terms: White Orange, 9@9¾, few reported quoting 8½; White Sage, 8½@8¾; Light Amber Sage, 6½@7; Light Amber Alfalfa, 5¾@6. Beeswax: Cash to beekeepers, 22@24 per lb.

### BEANS

F. o. b. Cal.:

| | |
|---|---|
| Lima, Standard | 8.90@9.00 |
| Lima, Henderson Bush | 9.00@9.15 |

Cal. Lima Bean Growers Assoc. reports some sales made in June for Oct. delivery of 1922 Limas and Baby Limas at around $6.25@6.40 f. o. b. Coast. Demand for futures now quiet. Assoc. has been sold out of 1921 crop for some time.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 18.00@23.00 |
| Barley | 16.00@20.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 16.00@20.00 |
| No. 1 Alfalfa | 15.00@17.00 |
| Standard Alfalfa | 11.00@13.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@20.00 |
| No. 1 Dairy | 14.00@15.00 |
| No. 1 Alfalfa | 12.00 |

### GRAIN

Prices L. A. Grain Exchange, August 1:

Barley: 100 ton lots August Del. 1.27½.

Grain Department California Farm Bureau Exchange:

Los Angeles, July 31.—The Los Angeles market has developed some weakness due to heavy arrivals of both wheat and barley.

Wheat: Good milling wheat is still salable at around $1.92½ to $1.95 but if arrivals continue as freely as they have recently, it is doubtful if these values will be maintained. It all depends upon how fast the farmers, collectively, in California let go of their grain. The fact that the California Farm Bureau Exchange does not control the crop in the San Joaquin and Sacramento valleys as fully as it did the Imperial Valley crop makes it impossible for the exchange to maintain values with a free movement of grain by non-members. Export demand has, to some extent, held values firm up to this time. This is hardly likely to continue as eastern markets are declining and wheat from Middle Western fields must be now available for exporting.

Barley: Forty-two cars of barley arriving on the Los Angeles track over Sunday has had a depressing influence. It was rather anticipated that short sellers would not be able to fill their July contracts but such has not proved to be the case. The best bid on August barley today was $1.21¼. It is likely that good No. 1 barley could be sold at around $1.25 for prompt shipment to Los Angeles but bids of this amount are not, today, obtainable. Unless an export demand immediately arises, we are sorry to say that the barley situation does not look very bright. If the exchange had full control or even a majority control of the California grain crop, a better result might be hoped for but such not being the case, we can only hope that next year a larger percentage of the grain farmers will sign up with the exchange and make it possible to market the crop in a more orderly manner to the end that a better average price for the season will be received by the farmer.

Oats: Demand continues strong. Good feed oats have been selling at from $1.85 to $2.00 Los Angeles. We are informed that Texas oats can be bought for about $2.10. As soon as the Utah, Idaho crop is available, the feed market for oats will, of course, be filled from that section.

Millfeeds: Millfeeds show a little easier tone for white and blended but there is no quotable change in price.

Imperial Valley grain crop harvest has been completed and the returns indicate that only about 60 per cent of the estimated quantity has been harvested.

**Figs, 1922, Cal. Peach and Fig Growers Assoc. prices:**

Opening quotations for the 1922 crop of figs released July 24 by the San Francisco representative of the California Peach and Fig Growers' Association, show substantial advances, particularly in black Missions. This grade is quoted at 11¼ cents this year, as against an opening price of 5 cents a pound in 1921.

The complete price list for 1922 crop Blue Ribbon, dried figs follows:

Adriatic—Price 6¼; standard, 6¾; choice, 8¾; fancy, 11¾.

Calimyrna—Standard, 8¾; choice 11¾; fancy, 14¾.

Black Mission—Standard, 11¼; choice, 14½; fancy 17¾.

These prices are for figs packed in twenty-five pound boxes, ¼c per pound less for packing in fifty-pound boxes. Adriatics, ungraded, in bags....7¼c per lb. Adriatic fig paste, 75-lb. boxes 5½c per lb.

| | |
|---|---|
| 12-10 oz., bricks, Adriatics | $1.10 per box |
| 24- 8 oz. bricks, Adriatics | 1.75 per box |
| 50- 6 oz. bricks, Adriatics | 2.80 per box |
| 70-d oz. bricks Adriatics | 2.95 per box |
| 24- 8 oz. bricks, Calimyrnas | 2.25 per box |

For foil wrap or brick figs add 10c per box.

| Box | Row | | Inches Spread | |

**Raisins, Sun-Maid Raisin Growers' Prices:**

Raisin growers may expect to receive 5¾ cents for standard muscats, 6½ cents for standard Thompsons and 6 cents for Sultanas, sweat box basis for the 1922 crop, according to a statement given out July 31 by the Sun-Maid Raisin Growers in connection with the announcement of new prices on the holdover of raisins from the 1921 crop.

Prices on the new crop will not be officially given to the public until August 15, but in a statement made by General Manager F. A. Seymour the trade is officially assured that new prices will be at least one-half cent higher than those named on the old crop, and the general manager is authority for the prices which the growers may expect under this schedule. The prices to be named on August 15 are on a crop basis of 225,000 tons, according to Seymour.

According to the general manager, 35,000 tons of 1921 crop raisins remain to be marketed at the new prices.

The revised prices on the 1921 crop named August 1 are:

| | Revised Price |
|---|---|
| Bulk Thompsons | 9½ |
| Carton Thompsons | 10 |
| Blk. Seeded Muscats | 9 |
| Fancy seeded pkgs | 10¾ |
| 1 cr. loose Muscats | 8½ |
| 2 cr. loose | 9 |
| 3 cr. loose | 9½ |
| Bakers. Thompsons | 7½ |
| Sultanas | 8½ |
| Seeded Malagas | 8½ |

### RICE

California Rice Growers Assoc. reports sales last week No. 1 Paddy 2.87@3.27. Crop practically cleaned up.

### HAY AND FEEDSTUFF

A. W. Scott Co. reports under date July 29:

ADD S F MARKETS

Receipts past week 1502 tons as compared with 1441 tons previous week. Consumers are still holding off a little waiting for prices to come nearer to their views based upon last year's figures and the general crop conditions for this season; but as their requirements become more pressing and with the prices moderating, the buyers' and sellers' views will probably become more in harmony with increased business resulting. Shipping and coastwise trade have been active, the volume heavier and the demand especially from coast points more healthy and in better tone than for some weeks past. Railroad conditions have stimulated the water shipments with the resulting benefit to the San Francisco market. Interior trading has been more active. Shipping has not been very active on account of the scarcity of cars in some localities and the activity in baling and handling the crop. Alfalfa has been doing better than any other grade of hay. Quite considerable shipments have been made and several sales of fair sized tonnage are reported at prices heretofore quoted.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

| | Ton |
|---|---|
| Wheat Hay, No. 1 | 15.00@17.00 |

### GRAIN

Prices S. F. Grain Exchange, July 31, f. o. b. S. F. warehouse and storage charges paid.

Barley Feed. 1.15@1.20; shipping, 1.25@1.35.

Wheat Mill, 1.90@1.95; Feed, 1.85@1.90.

Oats: 1.40@1.50.

Corn: White Egyptian, nominal; colored milo, 1.90@1.95; No. 2 bulk, 1.80@1.90; No. 2 Eastern yellow, 1.58@1.60.

Grain Department California Farm Bureau Exchange quotes prices delivered San Francisco:

Wheat: We have made a very complete canvass of the local wheat situation here today, and we find the tendency to be somewhat easier. The basic price against which the larger buyers are purchasing has been reduced to 1.90 on No. 1 hard white varieties, 1.85 on soft white, club and sonora, and these are the prices against which it will be possible to sell wheat in large quantities. We find however, that there is some little business available in a carload way among the chicken feed dealers, at prices slightly above these, but this chicken feed business is not large at any premium over the large buyers prices. The feeling existing among the buyers both large and small is that lower prices will prevail within the near future, and they are therefore only taking on immediate requirements. In view of the above, would state the general situation appears easier, with the probability of lower prices prevailing, within the near future.

Barley: The market continues very quiet with a tendency to further weakening; offerings are becoming very heavy. Prices for feed barley are holding up very well. We would quote the range as from 1.15 to 1.22½. There continues practically no demand for shipping barley, 1.22 to 1.27½ seems to be the best obtainable.

Oats: Market continues firm, less interest however, shown in feed oats, but seed oats continues in good demand at prices ranging from 1.90 to 2.15.

## Citrus Markets

Los Angeles, August 2, 1922.

The few remaining Valencias continue to bring good prices on eastern markets, though slightly lower on choice 126's-176's.

Lemon market remains about the same, still waiting for hot weather in the east to improve demand.

**Citrus Shipments**

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 20,250 cars; lemons, 8,245; total, 28,495. To same date last season: Oranges, 33,001; lemons, 9,529; total 42,530. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total, 6,788. From Northern California to date this season: Oranges, 372; lemons, 8; total 380. To same date last season; Oranges, 305; lemons, 5; total 310.

Pittsburg: 2 or., 2 lem. Val., 4.00@6.00; lem., 3.15@3.90.

Philadelphia: 5 or., 3 lem. Val., 4.45@9.70; lem., 2.40@4.75.

A dispersal sale of the small but high quality herd of registered Holsteins owned by Roy Bradley of San Bernardino, will be held at Rhoades & Rhoades pavilion at Hynes on Friday, August 11. Mr. Bradley purchased his foundataion stock in the Guaranty sales a few years ago and has used good bulls. His former herd sire was Prince Aralia who was out of Stanislaus Princess Cleopatra, a 32 pound three year old. A good share of the offering will be his daughters. His present herd sire is a son of King Segis Pontiac. Every animal offered for sale is tuberculin tested and guaranteed clean.

### THE PEACH PICKERS ART

(Continued from Page 123)

physical condition, and this is an important consideration if the grower is interested in having a good crop the following year. If a tree or a vine is allowed to put the last ounce of its strength into the maturing of this year's crop it tends to exhaust its energies to the point where it is difficult to recover in time to set a good crop the next year. This consideration is of particular importance in the case of late maturing varieties like the Philips Cling. Hence, get the current year's crop off as quickly as possible consistent with the prime condition of the fruit. Thus it will turn out in the end that better grade, in some cases increased yield of marketable fruit and the better resultant physical condition of the tree much more than repays the added expense of more frequent picking.

**Grading in the Field**

A discussion of the art of peach picking would be incomplete without some notice of the importance of grading in the field. This is a practice that deserves attention both from the standpoint of the grower and the canner. The writer should perhaps say right here that he has never been docked on a load of peaches. It is not because little peaches were never raised, but rather because they were kept to themselves. Not infrequently the few boxes of small but good peaches that had been sorted out were at the cannery's own initiative taken in with the first grade. It has been the writer's experience that small and defective fruits do not bulk large where an orchard is properly cared for, and further, that it is mighty poor head work to spoil the appearance of a whole load of otherwise first class fruit by letting culls and little stuff go in. The mathematics of the situation should appeal to the grower if no other consideration actually entered in. In a given case let it be assumed that the price for the first grade yellow clings is $50 per ton. However, the pickers are not true artists and allow some small and defective peaches to go in. It is all stuff that might easily have been picked out as the picker emptied his bucket and either thrown away or put in a box by itself. But as a result of indifferent methods the little, bird picked, and otherwise defective fruits go in. When the load at the cannery is sized up some of the worst boxes are discovered. It looks as though the fruit would require some extra sorting and handling, practices that are in themselves anathema to the best condition of the fruit. The result is that the load is docked. Let it be assumed that the fruit was docked to $40 per ton and that the load weighed just one ton. On this basis the grower gets $40 for his load of peaches. It develops later that if the grower had sorted out 200 pounds of poor fruit the load would have passed as first grade, or $50 fruit. On this basis the 1800 pounds of good fruit in the load would have brought the grower $45. Obviously it would have been better practice to have thrown away the 200 pounds of little fruit. If however, it had been put in separate boxes and taken in at $20 per ton $2 more would have been realized on the load, or a total of $47 as a result of the sorting. In summary the load of mixed fruit was docked and brought $40; if it had been sorted the same fruit might have brought $47. There are many other interesting situations that might be figured out but this is perhaps enough to show that the peach picker's art includes the orchard sizing and grading of the fruit.

### AUGUST GARDENING IN SOUTHERN ARIZONA

(Continued from Page 139)

Corn for roasting ears may be planted all through the month. Mexican June should mature sufficiently for roasting ears if planted any time during the month. The Papago and Pima are small eared varieties that mature quickly and so may be planted in succession until early September.

### HOG AUCTION DATES

Farm bureau hog auction sales will be held at Wasco, August 5; Tulare, 8; Visalia, 9; Hanford, 10; Corcoran, 11; Merced, 15; Turlock, 16; Madera, 17; Fresno, 18; Bakersfield, 19; Tulare, 22; Visalia, 23; Hanford, 24; McFarland, 25.

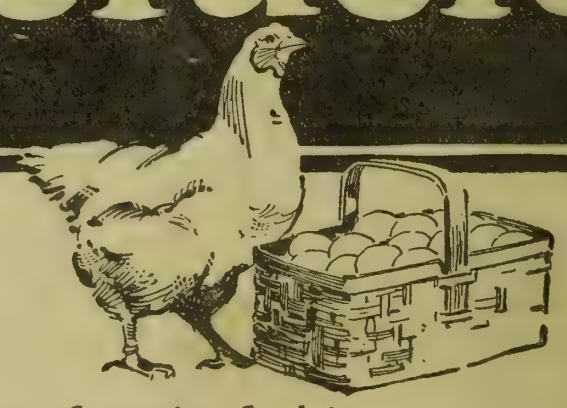
*what method of feeding do you use—*

# trust -to- luck *or* trust -to- cluck



THE difference between a poor-paying flock and a profit-paying flock is the difference between take-chances and take-NO-chances. Indifferent, haphazard, "trust-to-luck" feeding will never pay. It can't! Nothing will rob you of your rightful profits as quickly as blind feeding. True, your hens may live and be fairly healthy on a poor ration. But—

You are in the poultry business to make money. The more eggs you get the more money you net. You must realize, then, that it takes an excessive amount of a hen's energy to convert poor feed into money as against converting good feed into money. So that—far from saving money—the only result of a "cheap" ration is a *higher cost* for each dozen eggs produced.

A tasty, well-balanced ration is absolutely necessary for maximum production—that's sure! Equally sure is the fact that a uniform, quality-feed like SURELAY pays its way—and more! Its slight added cost comes back to you many times over in the extra eggs produced.

Have you ever compared the results you're getting from "trust-to-luck" feeds with the results other poultrymen are getting from SURELAY? After all, the real profit-point is this: What do your *hens* think of the feed you give them—and what do they do with it?

Why not put this egg-production question squarely up to your hens? Feed them SURELAY—a prime, true-to-test formula that has weathered the years—and let the results speak for the feed and for us. Meanwhile we suggest that you write for your copy of the new, enlarged edition of "Makes Hens Happy." It is the most complete and helpful handbook on poultry husbandry we have ever issued—and it's free. Simply clip the coupon—and mail today!

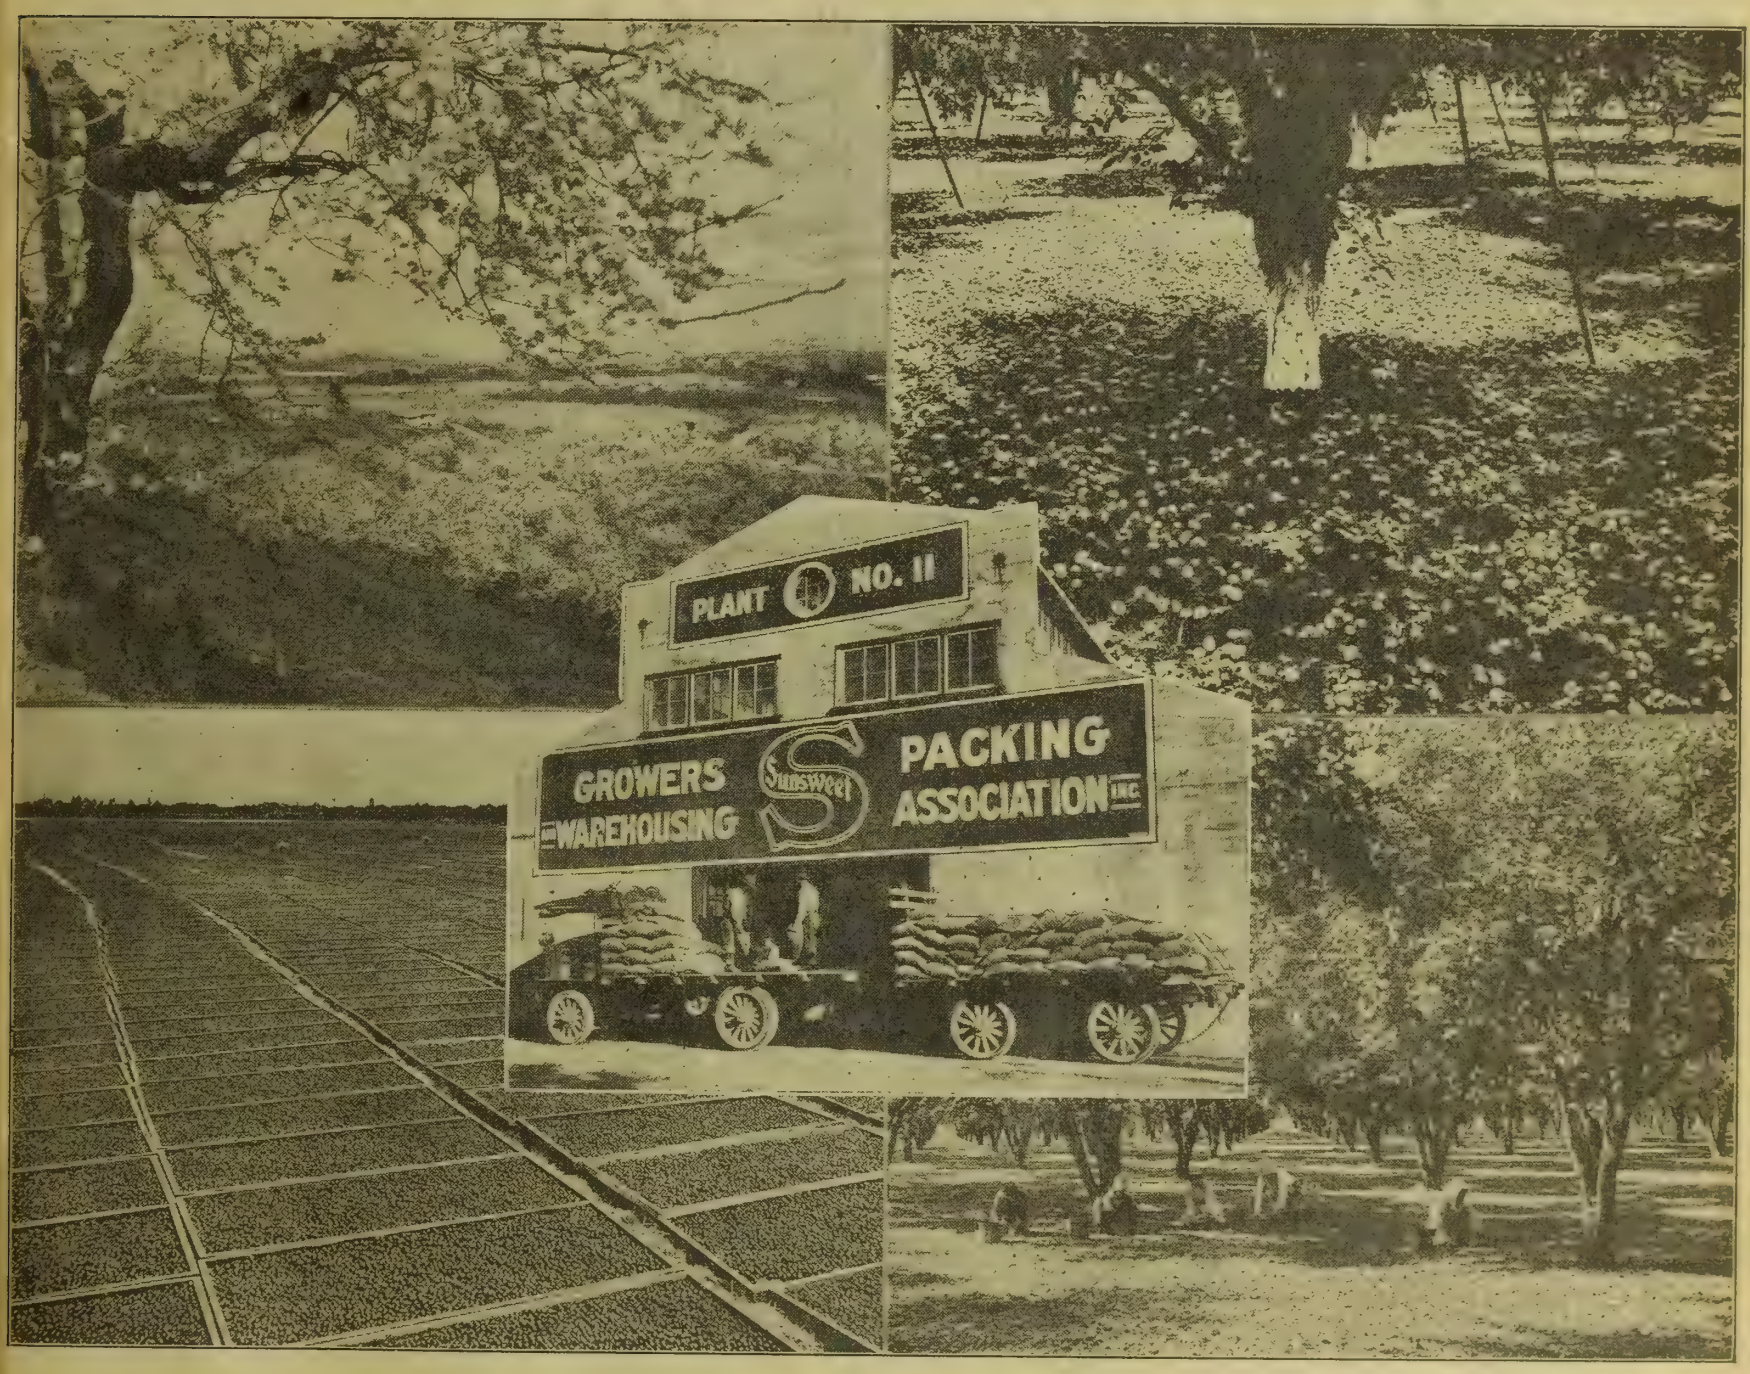
# Growing and Harvesting Sunsweets



At the height of the blossoming season in middle March each year, the acres of blossoming prune and apricot orchards look like a great white snow blanket spread over the valley floors.

The prune ripens late in August and during the month of September. It is not generally known that prunes are never picked but instead are allowed to ripen on the trees and fall to the ground from where they are picked up in buckets by women and children.

Sun dried and sun cured are no idle boasts of California prunes. Ninety-nine per cent of the crop is dried in an eight to ten day sun bath on immense drying fields, some of which are capable of holding 25,000 trays or more.

The orchard ground is usually picked three times before the crop is finished and in the last picking the trees are shaken slightly to bring all the remaining prunes to the ground.

The grower's work ends when he delivers his dried prunes to the association packing house. He is paid at least 50 per cent in cash of the price at which the fruit will ultimately be sold, complete payment being made as soon as the fruit is sold by his association.

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

### POUNDING THE ROADS

California is not alone in having its roads pounded to pieces by overloads. Note this from a Buffalo paper as to the situation in New York state:

"One of the most serious problems confronting the state of New York is that of preserving and protecting the state highways. The damaging and destructive effects of the overloading of motor trucks have already been revealed since the enactment of the regulatory law that went into operation April 7, as shown by the records of the state highway department.

"After the law went into operation the department put inspectors with loadometers in Westchester County and later in Nassau County. They have been weighing trucks in an effort to stop overloading. Their reports show that in the period from April 11 to June 10, 178 arrests for overloading were made; 14 arrests for bad tires; several hundreds for having no mirrors, and one for having excess of body.

"Information in the offce of State Highway Commissioner Sisson shows that the trucks which had the greatest percentage of overloads were of the five and five and one-half ton capacity; the next principal offender being the seven and seven and one-half tons."

According to Commissioner Sisson, there are now eight crews out in different parts of the state stopping and weighing trucks. It is the expectation that a campaign of this sort will be continued permanently. It will surely be found that in this matter as in all sorts of repair and inspection work, eternal vigilance will be the price of good roads."

### IN THE SENATE

The other day we saw legislation as is in the senate of the United States. The house is resting and waiting for the senate to catch up on the tariff bill. The senate is catching up slowly. Perhaps it would not be fair to accuse the senators of being as slow as the house was.

Anyway it's a big question—a big problem—this changing the tariff. We had the McKinley bill, the Underwood, Payne-Aldrich, Dingley and some other bills. Now we want the Fordney bill.

"We" means everbody. The democrats from Louisiana and Texas want rice protected, democrats from Massachusetts want shoes and manufactured cotton protected. Of course raw cotton should be free—for even republicans of Massachusetts—but for even democrats of highest degree south of Mason and Dixon line, highest protection is needed on raw cotton. The farm bloc has taken the initiative and secured the recognition of agriculture. Nearly everything agriculture asked for (it appears now) will be secured.

But, the manufacturer, wise beyond his generation, has turned in and worked for and now may secure protection beyond all reason for his wares. It has been estimated that the bill as it stands now at the end of July will raise the enormous sum of four billion, 800 million dollars. At present the senate is trying to scale the various schedules.

There are others who are trying to discredit the entire agricultural program. For them California offers opportunity. Note this in the New York Times of Friday, July 21:

"How many millions, for instance, are going to be paid as a bonus to Southern California for her lemons, almonds, figs, walnuts; her olives, the native consumption of which she supplies to the extent of three per cent; her dates, of which she supplies one-half of one per cent? All through the bill runs this mulcting of the consumer. Who is to buy the surplus of our agricultural and manufacturing products if we are to shut out or reduce to their lowest terms the import of foreign goods by which alone they can be bought? What but increasing unemployment can be expected from this attempt at embargo and non-intercourse?"

The untruthful statement regarding California lemons, etc., is a fair sample of the bitter fight being put up by importers and their allies. There can be no sufficient answer, for before the truth can be told another set of statements are issued calling for further denial.

So the position fight is kept up and watchfulness prevails on the part of agricultural interests. And agricultural interests are here in Washington not only as representatives of walnut growers, almond growers, wool growers and other single interests but there is the farm bureau, grange, N. B. F. O. and other organizations beside the "Farm Bloc."

But a word as to the senate: Through the courtesy of Senator Shortridge we were given seats in the executive and senatorial gallery. Senator Walsh, democrat of Massachusetts, was making attack on the wool schedule. Boston is the world's greatest wool market. Hence a great yearning on the part of the senator for free raw wooll and a tariff on manufactured wool.

Hence Senator Walsh talked to exactly five senators in their seats. One of these was listening, two (one of whom was Senator Lodge the other Senator Smoot) were conferring, and two others were reading. Possibly 50 other senators were in cloak rooms committees and reception rooms. Some senators are away at their homes or elsewhere.

The feeling prevails that the senate will in a very few weekes finish its work, when the bill will be sent back to the house which will reconvene as soon as the senate has acted, then to the conference committee (probably three from the senate and three from the house) when the bill may soon become a law.

THE HIGHEST QUALITY AND THE LOWEST PRICES IN OUR HISTORY

Repeatedly we are told by veteran Goodyear users that our tires today give more than twice the mileage they did twelve years ago.

What is even more surprising, *these superior Goodyear Tires of today cost less than half as much!*

Take our 30 x 3½-inch Cross-Rib fabric clincher as an example.

In 1910 you paid for this size tire $33.90; today, for a vastly improved tire of the same size, you pay but $10.95!

All other tires in the Goodyear line show similarly important reductions, the average decrease in price since 1910 being more than 60 per cent.

Goodyear Tires this season are at their highest point of excellence—larger, heavier and more durable than ever before.

Goodyear prices are now at the lowest point in Goodyear history.

# Fighting Black Scale: Last Season's Results and This Season's Prospects

## By H. J. Ryan, Horticultural Commissioner, Los Angeles County, Before Pest Control School at Pomona

BEGINNING in 1919, individual orchard records have been kept by district horticultural inspectors for practically all citrus orchards in Los Angeles County.

During May, June and July of each year an inspection is made, and each orchard is given a grade number indicating the degree of black scale infestation found at that time. The grade numbers used are A1, 1, 2, 3, 3B. The first two indicate very clean orchards and commercially clean orchards, while the last three grades are used for orchards which in corresponding order are questionable, badly infested or very badly infested.

Each year orchards are grouped according to treatment given during the preceding 12 months, and the average grade before treatment is compared with the average grade after treatment.

Where a number of orchards are included in each group a very definite comparison of results with different methods of treatment is secured by computing the per cent of improvement or deterioration from one year to the next.

Orange packing house inspection has since the January freeze demanded so much attention from district horticultural inspectors that the annual report on scale conditions is considerably delayed. The report is, however, complete for the portion of the county east of the San Gabriel Canyon.

In 1920 condition grades were reported on 1175 fumigated groves in the county, showing an average condition of 73 or seven points less than a No. 1 (commercially clean) grove. The average condition of 2235 fumigated groves graded in 1921 was 76, an improvement of three points. This is probably because the 1920 grades were chiefly of orchards in the eastern portion of the county, while the 1921 totals included many orchards from citrus districts southeast of Los Angeles City, where the black scale infestation is generally lighter.

Incomplete reports for 1922 show 1810 fumigated groves from various parts of the county, with an average grade of 79. While it is possible that increased efficiency in fumigation practice has had an influence in the average improvement of fumigated groves, it is more than likely that the higher average is due to three factors outside the control of the orchardist. In order of importance these are:—

(1) Exposure of scale insects to sun, wind and rain as a result of defoliation or partial defoliation of groves by frost.

(2) Attack of Isaria fungus, which has been unusually prevalent, due to abundance of moisture.

(3) (a) Natural insect enemies which have been on the increase because of abundance of food and, (b) very apparent natural mortality due to unknown cause.

In tabulating grove conditions reports for eastern Los Angeles County this season we find an appreciable and fairly constant difference in average improvement or average deterioration between groves severely injured by frost and uninjured orchards, in favor of the latter.

In other words, frost injured groves show at present a lighter infestation of black scale than groves having had the same treatment but which were not injured.

This is seen clearly in the following tables, which also show a comparison between results of various treatments:

An examination of Charts No. 1 and No. 2 will show some interesting comparisons. It will be seen that the average condition of frost injured groves is in each case better than the average condition of uninjured groves. It is also interesting to note that groves which were sprayed in 1921-22 were in worse condition before treatment than any other class of groves, and that groves which received no treatment between the summer of 1921 and the summer of 1922, were in better condition when first inspected than any group of groves which received treatment.

The contrast between the condition of such groves in 1922 and the condition of fumigated groves for this season, is much more startling.

Chart No. 3 below combines Chart Nos. 1 and 2, and since therein are

(Continued on Page 150.)

**Chart No.1—Groves Injured by Frost**

| Treatment | No. of Groves | Av. Grade 1921 | Av. Grade 1922 | % Improvement | % Deterioration |
|---|---|---|---|---|---|
| H. C. N. | 427 | 69.3 | 79.5 | 15 | x |

# Selling Olives at a Profit

## By A. M. Drew, President California Olive Growers

A COPY of the letter from your Oroville correspondent wherein he questions the accuracy of the statement by the writer in the article appearing in your columns July 8, 1922, is before me, and I feel that it is incumbent upon myself to make good the statement in my former article wherein I said that "an excellent grade of olives should retail at 25 cents per quart." I had reason to believe that such a statement would be questioned when I made it, and I am therefore not surprised at the contents of the Oroville letter, from which I quote:

"In your issue of the California Cultivator of July 8, I noticed an article written by Mr. Drew, which I read with very much interest, as it covered part of the selling end of the olive industry in connection with the forming of the new Olive Association. While Mr. Drew stated that an excellent grade of ripe olives could be retailed at 25 cents a quart, he did not mention the grower, who I understand should derive some benefit from the formation of this new association, and I would like very much to have Mr. Drew enlighten me as to where the grower would come off and how much he would receive for his olives. According to my way of figuring, I would have to deliver my olives to the packing house and pay three cents per can on top of it, without getting any return whatsoever. In other words, if I would let my olives drop off the trees I would be ahead of the game to the tune of about three cents per quart, or $48 per ton."

The writer of the letter says it costs him 28 cents per quart to can without paying anything for the fruit, and that he would be the loser at the rate of $48 per ton if he sold his olives at 25 cents per quart. I do not know to what grade of olives he refers, whether to standards, mediums, large, extra large or mammoths, but my statement was based upon medium olives, because I know that the medium furnishes the grade that is most in demand. In a packing of 450 tons, 30 per cent of the amount was of that grade. With reference to the expense that the gentleman is to in packing medium olives will say that he is certainly paying too much for labor and material, or his packing house is not fitted for the handling of olives cheaply. The table hereinafter set forth showing the cost of handling and packing is based upon the financial conditions of 1921. I presume it will be admitted that we have not yet reached normal financial conditions. By that I mean that war prices have prevailed and are yet prevailing to a considerable extent over pre-war prices. There has been a drop of 25 per cent in sheet tin during the last year, and there is little doubt but there will be a further decline in the price of that material, but under last year's prices with improved methods and machinery I claim that the statement made in my former article is still correct, and that a retail price of 25 cents per flat quart can be reached and maintained and the grower receive a better price for his fruit than the packer has seen fit to give him for the crop of 1921 for medium grade olives, providing we can successfully organize the olive growers of California into a cooperative company strong enough to control selling prices.

### Handling and Processing

Olives should reach the grader within 48 hours from the time they are taken from the trees, unless they are shipped in solution, and this is done only at a heavy expense, as barrels are expensive, and water is heavy.

The following table is based upon door deliveries of olives carefully and cleanly picked of the right degree of ripeness.

### Table of Costs

| | Per ton |
|---|---|
| Unloading, weighing and delivering to the grader | $ .20 |
| Grading to size, color and quality | 8.33⅓ |
| Procesing and curing | 3.00 |
| Salt and caustic | 1.33⅓ |
| Sorting and canning, including cans and salt | 79.85 |
| Retort service and sealing | 3.33⅓ |
| Cooking 40 minutes at 240 deg. | 5.00 |
| Labeling and casing | 2.43⅓ |
| Labels and paste for 1,680 cans | 8.56 |
| 70 cases | 7.70 |
| | $119.75. |
| Plus loss of material in handling | 5.25 |
| Total | $125.00 |

$125.00 ÷ 2,000 lbs. = 6¼ cts. per lb. + 5 cts. to grower. 1 lb. 2 oz. per can @ 11¼ cts. per lb. 12 3/10 cts. per quart.

Allowing the difference between 12 3/10 cents per quart can and 20 cents, 7 7/10 cents to the freight costs and jobbers' commission, we have the fruit in the hands of the retailer at 20 cents per quart, and he certainly ought to be satisfied with a special article and a special price to retail at 25 cents, which gives him 25 per cent profit. If the advertising is done for him (and special advertising must be done in order to put the olive industry on its feet) he is out nothing in that line, and the olive grower is by that means reaching the people and increasing the demand for olives. I am aware that there are difficulties in the way, but in my opinion these problems will be solved and the difficulties overcome if we can act together as a unit in the growing, canning and selling of this fruit. Without the state organization we are continuously (and when I say we, we mean the packing end of the industry) cutting each other's throats by useless competition.

The higher grades of olives will necessarily bring the grower a better price, and he must depend upon those grades for his profit, but if he receives 5 cents a pound, or $100 a ton for his mediums, he will receive much more than he has been getting and will still have the opportunity of making something additional out of the larger sizes.

I shall be glad if your interested readers will comment upon and criticize this article and show me, if they can, where the errors are, but these figures have been taken from a carefully prepared record of the past year. It is recognized that our manager has made a financial success of our house as we have now sold to the trade out of this coming year's pack almost as many olives as we put up last year. Of course, we realize that we have an experienced man as manager and that we have a careful, practical, competent man in charge of the processing. We are doubling our membership and expect to handle double the quantity of olives this year over last.

# Agricultural News Notes of the Pacific Coast

## Northern California

Walnut growers of Humboldt County report prospect for a heavy crop.

Warm weather is favorable to rapid growth in the rice fields of Tehama County.

August 16-20 at Petaluma, combined Egg Day celebration and Sonoma-Marin County fair.

The horticultural commission of Sutter County has begun systematic fight on yellow star thistle.

It is proposed to include the land of the Colusa County Land Company in the Glenn-Colusa irrigation district.

Approximately 6,000 sacks of rice were sold July 19 by the California Rice Growers at an average price of over $3.00.

Gravenstein apples from the Sebastapol district of Sonoma County are of unusually good quality and are ripening fast.

Prof. W. T. Clarke of the University of California has been in Butte County investigating unusually severe dieback of prune trees.

Newcastle, Placer County, has been sending out 15 to 18 carloads of fresh fruit daily. 30 cars a day is the average from the county.

The channel of the Petaluma River between Petaluma and Lakeville is being straightened under direction of the federal government.

The Northern California Rabbit Breeders Association is planning to make an exhibit at the state fair at Sacramento, September 2-10.

The San Francisco office of the California farm bureau grain department handled during July 20,000 tons of grain. The office has just been established.

Supervisors of Sonoma County have let contracts for the erection of bridges on Washington street, Petaluma, Sebastopol-Cotati highway and Pocket Canyon road.

The Fourth Annual Eden Township Show is on this week at Hayward, Alameda County. Today, August 12, Prof. Rice of Cornell University will lecture to poultrymen.

Manager Hyrup of the Colusa County fair says that exhibition space is rapidly being taken, much of it by exhibitors from outside the county. The fair will be held at Colusa, September 13-17.

Entomologist Urbahns of the state department of agriculture is superintending extermination of a pest of caterpillars found destroying 75 acres of beans near Yuba City. A machine is being used to scatter poison dust.

The bulk of the apricot crop in the Santa Clara Valley is being canned this year, though some is being shipped green, therefore a proportionately smaller amount of sun curing is being done. The moderate temperatures of the past week were favorable for apricots because too rapid ripening was prevented.

In his report at the recent annual meeting of the California Rice Growers at Sacramento Manager Merritt stated that during the past six months California rice has been selling for an average of $2.65 per 100 pounds for paddy, while rice in the southern states during the same period has brought $2.27½ per 100 pounds.

## Central California

Turlock has shipped 1,000 carloads of melons, most of them cantaloupes.

Rapid progress is being made on the Don Pedro dam. 600 men are working.

The cannery at Hilmar has opened on its peach pack which will be unusually heavy.

Settlers on the state land colony at Delhi are planning to hold a stock show in September.

The Turlock Melon Growers Association has been paying $14 to $16 per ton for watermelons.

A cow testing unit is being formed at Dos Palos. Merced County. Two hundred and fifty cows have already been signed up.

The California Peach and Fig Growers says there is no foundation for rumor that equipment of the Merced plant will be moved to Fresno to replace that recently burned.

At the last meeting of the Fort Romie grange a resolution was passed asking granges of the nation to aid in enactment of federal legislation restricting immigration of Japanese.

The Coalinga, Fresno County, chamber of commerce has launched a campaign to complete work on the Coalinga-San Lucas lateral so that it will be passable during the winter months.

The Turlock Melon Growers Association has relieved members of contract obligations so that they may make independent sales. The association expects to resume shipping when the market picks up.

The management of the Sun-Maid Raisin Growers made a big cut in prices of 1921 raisins to get them out of the way of the 1922 crop. 1922 prices will probably be announced the middle of the month.

The new precooling plant at Dinuba is being tried out on fresh grape shipments. The plant was built by the Dinuba Grape Growers Association and is considered an improvement on other preicing plants now in operation.

Opening prices for the 1922 raisin crop indicate that this year's base price will be 6 cents per pound as against 10 cents last year. Estimates made by the Sun-Maid Raisin Growers anticipate a 225,000 ton crop this year.

"Entirely feasible and comparatively easy of construction" is the report brought back by the survey party, of the San Joaquin Valley Commercial Secretaries Association, sent out to determine the possibility of constructing a road from Huntington Lake over Piute Pass to Bishop.

Frank B. Astroth, fieldman for the Pacific division of the National Jersey Breeders Association, will come to Stanislaus County, August 17, and hold a series of meetings now being arranged by President Miller and Secretary Conant of the Stanislauas County Jersey Breeders Association.

Italian vegetable growers near Oakdale, Stanislaus County, will loose some 3,000 sacks of onions because they were refused by the San Francisco buyers who had contracted to purchase them. The onions were refused on the ground that they were not up to grade but this was after the bottom had dropped out of the onion market.

## Southern California

A new cotton compress has been built at Calexico.

Former Iowans picnic at Bixby Park, Long Beach, today.

Imperial's grape crop is practically harvested. The yield has been good.

San Luis Obispo County expects an almond crop twice as large as last year's.

Considerable damage to grapes from leafhoppers is reported from Coachella Valley.

Estimates on Yucaipa Valley's 1922 apple crop range from 300,000 to 500,000 packed boxes.

The sweetpea crop in San Luis Obispo County has been cut and stacked in fields to dry.

San Luis Obispo County reports beans blossoming slowly due to continued cool summer weather.

George S. Spurrier has been appointed manager of the San Louis Obispo County Farm Bureau Exchange.

Olive orchards at Sunland, Los Angeles County, show very light setting, some orchards not enough to pick.

The early peach crop of the Yucaipa district amounted to about 2100 packed Los Angeles lugs. The season closed July 26.

The railroad has made concentration rates on cotton from Palo Verde Valley points to the new compress at Phoenix, Arizona.

The Navel crop in the Redlands districts is sizing up well. Estimates are now made anywhere from a third to a half normal crop.

The Los Angeles office of the grain department of the California Farm Bureau Exchange, just established, has handled 8,000 tons of grain.

Escondido, San Diego County, has a splendid crop of grapes and is going forward with big plans for celebrating Grape Day, September 9.

Los Angeles storage houses on July 28 showed 215,508 cases of eggs and similarly large quantities are in storage at other California points.

Great plans are being made for the walnut growers field day to be held at Santa Barbara, September 2. President C. C. Teague will be the speaker of the day.

The Riverside district has already shipped out 3100 carloads of citrus fruits. 400 men are working in three shifts on construction of Warner's dam in the San Luis Rey River.

At the recent meeting of the Associated Chambers of Commerce of Imperial Valley a resolution was passed favoring the opening of the duck season on September 1 instead of October 15, to save newly planted barley.

A. R. Bixby sends in correction of an item appearing in a recent Cultivator which stated that plans were being made for construction of an evaporating plant at Banning to cost $40,000. Mr. Bixby says this plant is to be built at Beaumont.

The United States weather bureau reports for Los Angeles County: New crop oranges has set fairly well; lemons show very little fruit in groves hit by frost last winter, but there is considerable improvement in condition of trees; walnuts developing well; fog near coast favorable for beans.

## The Coast and General

The sugar beet crop throughout Europe will be good.

A prune harvest festival will be held at Vancouver this fall.

This year's cotton in the United States is estimated at 4,449,000 bales.

Germany this year will raise sufficient sugar beets to supply her own needs.

Alfalfa seed harvest continues in the Yuma district. About two-thirds of the crop is cut.

Second crop figs are maturing in the Salt River Valley of Arizona, and watermelons continue abundant.

A modern cotton compress and warehouse will be in operation at Phoenix, Arizona by the middle of September.

Export of oranges from Palestine in 1921-22 amounted to 1,100,000 cases as compared with 830,000 cases the previcus year.

The Chinese are becoming enthusiastic consumers of American foods; canned and dried fruits, coffee, jams, syrups, etc.

A hearing is now being held at Santa Fe, New Mexico, by the Colorado River Commission. Seven states are represented.

The Kansas Wheat Growers Association has asked the war finance corporation for an advance of $2,500,000 to finance marketing.

Almeria, Spain, has a big grape crop this year. Much of it will be exported to the United States. Last year's shipments started on September 25.

The Texas Farm Bureau Sweet Potato Growers' Exchange, which met in Dallas recently laid plans for increasing the annual sweet potato crop of Texas from 1,000,000 to 5,000,000 bushels.

Swine raisers in Argentina have formed an association with headquarters at Buenos Aires. The largest hog farm in the republic covers 10,000 acres and is stocked with 15,000 Poland Chinas.

Development of new highways in Arizona is extending auto truck lines to all parts of the state. Fresh fruit, vegetables and dairy products can be delivered daily at the mining towns in prime condition.

Both Alberta and Saskatchewan have passed legislation looking toward appointment of a dominion board to supervise marketing of Canada's 1922 wheat crop. It is expected that federal action will soon follow.

With the return of the dairy cow to the Salt River Valley, there has also been a replanning and broadening of the scope of cow testing organizations. There are about 21,000 dairy cows in the Valley at the present time.

The mutton and lamb carcasses shipped from Argentina and Uruguay in 1921 were 2,743,000, compared with 1,898,000 in 1920. There were 5,823,000 quarters of beef shipped in 1921, compared with 6,552,000 in 1920.

The French chamber of deputies recently passed a law authorizing the government to fix by decree the percentage of wheat in flour and the addition of substitutes in preparation for the expected shortage in this yeaar's wheat crop. The crop is variously estimated at from 50,000,000 to 100,000,000 bushels short of requirements.

# Spray and Thin for Better Fruit

By Ernest Braunton

NEARLY 100 persons interested in better deciduous fruits met at a banquet given by the Southern California Canners Bureau on the evening of August 1 to discuss means and measures best to pursue in order to raise the standard of deciduous fruits grown in the south end of the state. There were present, aside from representatives of the canners, men from the United States bureau of plant industry, from the California state department of agriculture, the citrus experiment station, farm bureau presidents, farm advisors and a few prominent horticulturists, teachers, etc.

**The Speakers**

The repast over, J. A. Campbell, general manager California Growers' Association, Inc., acted as chairman. After stating the object of the meeting he said that before the war no attempt had been made to grow larger fruits. The grower produced the largest tonnage possible and canners looked for tonnage also. Consequently Southern California was known for its output of low grade deciduous fruits. Now all want, and we must have, better raw products in this line, and the growers must do two things; spray and thin. He then introduced the first speaker.

**Robert W. Hodgson**

Farm advisor of Los Angeles County, spoke on what his office could and would do to aid the educational campaign. The agricultural extension service, through the state university and United States department of agriculture, joins with boards of supervisors of the various counties in extending aid of a practical nature to the farmers. They have regular programs and field demonstrations to educate growers along lines which this meeting was called to discuss. Among these are sprayings for diseases which mar fruits, thinning of fruits, pruning, bud selection, and irrigation. Poor varieties and poor conditions are responsible for poor fruits. Organization and deciduous fruit contests are needed.

**George P. Weldon**

Pomologist, Chaffey Union High School, was the next speaker. He had with him specimens of the Ontario cling and Tuscan Cling peaches, the latter having several other names in common use, to show the differences of fruit and foliage, which were quite marked. The Ontario is the chief canning peach now being planted in San Bernardino County. With the aid of a chart he showed some of the beneficial effects of spraying. On ten trees sprayed with lime-sulphur in February for twig borer but two wilted tips were found, while on seven nearby trees unsprayed 125 wilted tips were counted. March 15, ten trees sprayed with dry lime-sulphur were found to have seven wilted tips, while on ten trees not sprayed were found 171 wilts. Trees sprayed same date for curl leaf showed but four per cent affected while unsprayed trees were 47 per cent affected. Still more striking were two other plats which showed but 1.2 and .2 per cent curl leaf as against .70 per cent and .62 per cent respectively for unsprayed trees. The peach scab, a cladosporium, will not allow peel to come off through lye dip and affected parts must be treated by hand, so canners refuse scabby fruit. It is absolutely necesary to spray peaches for twig borer and curl leaf, and the lime-sulphur sprays, either wet or dry, are preferable to arsenate of lead, which will burn under some conditions.

**Dr. T. J. Barrett**

In charge Riverside citrus experiment station, had a number of fine enlarged photos passed around the tables, showing the ravages of various diseases on peaches and apricots, both fruits and trees. He said what we call "shot hole fungus" is "shot holes" only through leaves. On apricots it is apricot spot, on peaches it is peach blight. Mildew was found on apricots in one orchard, rather serious. It was found it came from two large rose bushes. When the latter were destroyed the disease vanished, though some injury had resulted. Fog mark is another "cot" trouble. No organism was found, but it is due to moisture settling on the fruit and then the sun shining on it. Bacteriosis of apricots was worse this year than ever before, and for the first time was found on fruits. Apricot scab injuries were also shown. Apricot rust no longer bothers as it was due to pruning as soon as crop was off and resultant new leaves carried disease over winter to the new spring growth, from which the leaves would drop. As this pruning practice has practically passed, so has the disease. Every grower should spray with Bordeaux each year. Even though not needed some years, it still would pay over any given stretch of years.

**Dr. H. S. Reed**

Also of the Riverside station, gave the results of three methods of pruning and of leaving unpruned over a series of six years, illustrated with some fine photos. Long pruning had made a poor showing for fruits were borne nearly all on the tip of branches, where exposure to the elements had rendered them unmarketable. Short and medium pruned trees bore inside fruits, and unpruned trees produced the heaviest tonnage. But the fruit on the latter, owing to no inside or lower fruit spurs, is coming out so high that long ladders are needed for picking. During the six years the total crops grown by the three methods of pruning were compared to 100 per cent or full crop, 55 for short pruned, 75 for medium pruned, and 95

# New Fruit Beverages

By W. V. Cruess and J. H. Irish,
University of California

THE great American public, and particularly that portion of it which indulges in following the big league baseball games, circuses country fairs, and other similar celebrations, consume enormous quantities of carbonated beverages. The writers estimate the consumption at five billion bottles per year.

**Why Not Use Fruits?**

Fruit growers who have studied the present planting of all kinds of fruit in California face the situation with considerable uneasiness. They would like to see new outlets developed for California fruits. Many of our fruits are ideally suited to the making of carbonated beverages. The writers strongly suggest the use of more California fruit in preparing the aforesaid five billion bottles of carbonated beverages. If we can only get one billion bottles made up of fruit products it will be worth while.

**How the Fruits May be Used**

The writers have found that various fruits, particularly berries and pomegranates, citrus fruits and grapes, can be converted into syrups that can be used by the average soda water fountain bottling works with a slight addition of equipment.

In our experiments we have found that berries yield a delicious syrup which can be carbonated by a very simple process. The berries are sorted and washed. Strawberries need not be stemmed. The berries are then crushed and heated to about 150 degrees F. to extract the color. They are then pressed and the juice so obtained is filtered. To this juice is added about 12 pounds sugar per gallon to make a syrup of about 65 per cent sugar. This syrup is put up in lacquered cans and pasteurized at 175 degrees Fahrenheit.

At the University Farm Picnic
Two methods of connecting with the fruit beverages. Bottom, "dead soldiers."

We have at the university a complete juice making and bottling outfit. We take the above berry syrup and dilute it to about 50 degrees Balling and use 1½ ounce of the syrup for each bottle of soda water bottle size. We then add carbonated water charged to 50 pounds pressure with carbon dioxide. The filled bottles are sealed with Crown caps and are then pasteurized in water at 150 degrees Fahrenheit for 30 minutes.

Pomegranates we cut in half and press, obtaining a purplish red juice. In order to clarify this juice we heat it to 150 degrees Fahrenheit to coagulate the proteins. The juice is allowed to stand 24 hours and is then easily filtered to give a brilliantly clear juice which is sweetened to 50 degrees Balling with sugar. We find that Muscat grapes and wine grapes mixed together in equal proportions, crushed, heated to 150 degrees Fahrenheit, pressed, filtered and concentrated in a glass lined vacuum pan to 50 degrees Balling yield an excellent syrup for bottling purposes. Any of these syrups can be preserved by pasteurizing or by storing in lacquered cans in a freezing room without pasteurization. Either method gives good results.

**Citrus Drinks**

Most of our readers, we believe, are familiar with the fact that orange and lemon drinks do not retain their flavor satisfactorily. Under ordinary conditions we find in our experiments that the best citrus drinks are composed of

(Continued on Page 156)

## FIGHTING BLACK SCALE: LAST SEASON'S RESULTS AND THIS SEASON'S PROSPECTS

(Continued from Page 147.)

a larger number of groves of each group, is probably a truer index of comparative results than either of the other two.

and 3 in comparison with the 1922 figures.

To further emphasize this point, we have shown in Chart No. 4 and Chart No. 5 the relative number of good groves remaining in good condition after treatment and the poor groves improved in condition after treatment.

when the groves are in good condition at the start.

iage will afford good protection and such an ample food supply that an unusually numerous and strong brood of scale will likely result and a large hatch will be the result next summer.

The reproductive powers of the back scale, even more than in the case of many of the other prolific scale insects, are so great that a comparatively light infestation may, and often does develop to dangerous proportions in a year's time, if there prevail conditions favorable to a natural increase.

With so many orchards in a weakened condition because of frost injury, it is more than usually important to apply the most effective possible treatment this fall, to keep the infestations under control.

**Chart No. 3—Recapitulation Injured and Uninjured Groves**

| Treatment | No. of Groves | Av. Grade 1921 | Av. Grade 1922 | % Improvement | % Deterioration |
|---|---|---|---|---|---|
| H. C. N. | 650 | 69 | 80 | 16 | x |
| Cyanof | 814 | 69 | 80 | 16 | x |
| Pots | 89 | 68 | 79 | 16 | x |
| Spray | 132 | 62 | 61 | x | 2 |
| None | 196 | 74 | 51 | x | 31 |

**Chart No. 5—Present Condition of Groves Graded 2, 3, and 3B in 1921**

| Treatment | Good Groves 1921 Number | Good Groves 1922 No. | Pct. |
|---|---|---|---|
| H. C. N. Fumig. | 281 | 221 | 78— |
| Cyanof. Fumig. | 335 | 227 | 68— |
| Pots Fumig | 35 | 23 | 66— |
| All Fumig. | 651 | 471 | 72+ |
| Sprayed | 70 | 28 | 40 |
| Untreated | 62 | 4 | 6— |

### Present Condition of Groves

Chart No. 5 is perhaps worth more study, as in each case the groves were to begin with, badly infested.

In analyzing the foregoing and the following charts, the reader should bear in mind that it is more difficult to show a difference in degree of improvement after various treatments, when the orchards are on the average in good condition at the start, than when they are badly infested.

To illustrate, let us suppose we have 200 groves in A1 and 1 condition to begin with, and we give 100 a certain method of treatment and 100 another method. Both methods were good, but one was slightly superior to the other. It would be much more difficult to show that difference in a comparison of results than if the original 200 groves were badly infested at the start. The application of this argument is readily seen if one will analyze the 1921 figures in Charts Nos. 1, 2

**Chart No. 4—Present Condition of Groves Graded A1 and 1 in 1921**

| Treatment | Good Groves 1921 Number | Good Groves 1922 No. | Pct. |
|---|---|---|---|
| H. C. N. Fumig. | 369 | 349 | 95— |
| Cyanof. Fumig. | 479 | 459 | 96— |
| Pots Fumig. | 54 | 51 | 94+ |
| All Fumig | 902 | 859 | 95+ |
| Sprayed | 62 | 29 | 47— |
| Not treated | 134 | 46 | 34+ |

The percentage figures in Chart No. 4 compared with the percentage figures for groves in Chart No. 5 having had the same treatment, will make clear that it is easier to keep a grove in good condition than it is to get it in good condition once it has been allowed to run down.

The one per cent difference shown between fumigated groves in Chart No. 4 is negligible and indicates the difficulty of showing a comparison between effective methods of treatment

### This Season's Prospects

Orchard infestations of black scale are lighter this year than at any time since the summer of 1917. To the present writing, July 15, weather conditions during the hatching period have been normal and unless some unforeseen influence occurs to cause an unusual mortality of young scale, it may be safely expected that the average infestation will be much more severe in 1923. In frost injured groves an abundance of heavy succulent fol-

## GYPSUM IMPROVES POTATO AND ALFALFA YIELDS

Particularly good results have been obtained by the use of gypsum on soil infested with potato scab. On a 23 acre field in the San Fernando Valley that had been infested until the ground caked to a degree that it would break a potato digger, H. L. Boyer, at Van Nuys, applied 1000 pounds to the acre after plowing under a cover crop the first of May. The planting was started July 20. The results were apparent from the beginning. A splendid stand of thrifty potatoes resulted and in the fall on 19 acres treated the yield was 110 sacks to the acre and the sacks averaged 111 pounds. The potatoes were entirely free from the scab that had infested the potatoes on the field the previous years, so free that all were sold for seed. The crop was marked to the very row that the gypsum was applied. Four acres were planted in the same field where it was not applied, and the potatoes were scabby again.

The scab free potatoes were sold in the field at 3 and 3½ cents per pound, and later those warehoused sold for seed at 4 and 4¼ cents, commanding a good margin above the market. Mr. Boyer found the ground treated with gypsum to be so free from scab and in such good condition that without further applications he followed with another potato crop which yielded 2400 sacks. Those on the treated ground were again free from blemishes. Mr. Boyer plants his seed 11 inches apart in the rows, then makes the rows 36 inches apart, allowing more room for irrigating, cultivating and harvesting. His revenue from the 23 acres, allowing only 2 cents per pound for the potatoes on the four acres that were scabby, was $7400.

### Good Results on Alfalfa in Fresno

Mr. Boyer formerly farmed a dairy ranch of 520 acres in Fresno County. The land was inclined to black alkali. On this he sowed a ton of gypsum to the acre; allowing the fall rains to dissolve it on the ground, and the solution soaked in, neutralizing the soil condition until abundant crops of alfalfa were grown, also penetrated hard pan and flocculated the soil. On black alkali soil that would not produce a crop without gypsum Mr. Boyer was able to produce from eight to ten tons per year. Usually the season yielded six cuttings, the first and second cuttings running 1½ to 2 tons. Sudan grass was sowed on the high ground that could not be irrigated and this afforded splendid grazing for his 210 dairy cows when frost conditions in the fall made early morning grazing on alfalfa dangerous to the cows, on account of bloat. His experience proved that cows would not bloat on the Sudan grass and they were always eager to feed on it.

# A WARM GAS

FROM LIQUID HYDROCYANIC ACID is now available for FUMIGATION PURPOSES through the development and final perfection of the

## HYDRO-CY VAPORIZER

(HORSE-DRAWN)

VAPORIZED GAS

**by means of the Hydro-Cy Vaporizer is recommended at the Pest Control School at Pomona July 15th, as the most EFFECTIVE and EFFICIENT Method of Fumigation. "Vaporized liquid gives a better diffusion within the tent than when atomized through the nozzle."**

## ADVANTAGES:

The HYDRO-CY VAPORIZER, as the name implies, is a machine which converts liquid hydrocyanic acid into a warm gas and delivers and distributes it under the tent with a precision that guarantees the grower full value of all the liquid measured.

The EFFECTIVENESS of this method of application is unquestionably superior to all others. It eliminates all doubt as to the gasification of the liquid and insures quicker diffusion and more thorough distribution of the poisonous gas under the tent. It lessens the danger of damage to young trees, fruit or foliage, by completely eliminating any contact of the liquid with the tree.

With this machine liquid hydrocyanic acid can now be used with confidence and insurance of results at temperatures recommended by the Horticultural Commissioners for Pots and Cyanofumers. Under the new regulations laid down by the County Horticultural Commissioners, the use of liquid gas, as applied by atomizing machines, must stop when the temperature falls below 50° F. A vaporizer makes it possible to continue working below this temperature and hence provides insurance against the loss of time.

The Uniformity of Treatment of each tree is another distinctive advantage and feature of this machine for the last tree in the row receives exactly the same treatment, with respect to accurately measured dosage and temperature of the gas, which every other tree in the row receives.

**FIELD TESTS**

During the spring months of this year two machines were in continuous operation and gave such satisfactory service that we were prompted to make more available for this coming season. **The principle of Vaporization has been tried and proven during the past two seasons.** "Vaporized" gas gives better results because of quicker and better diffusion under heat.

Wage your battle against the Scale Pests by using only the latest improved methods of Fumigation. The Hydro-Cy Vaporizer will solve your problems. Write today for full particulars. Manufactured only by

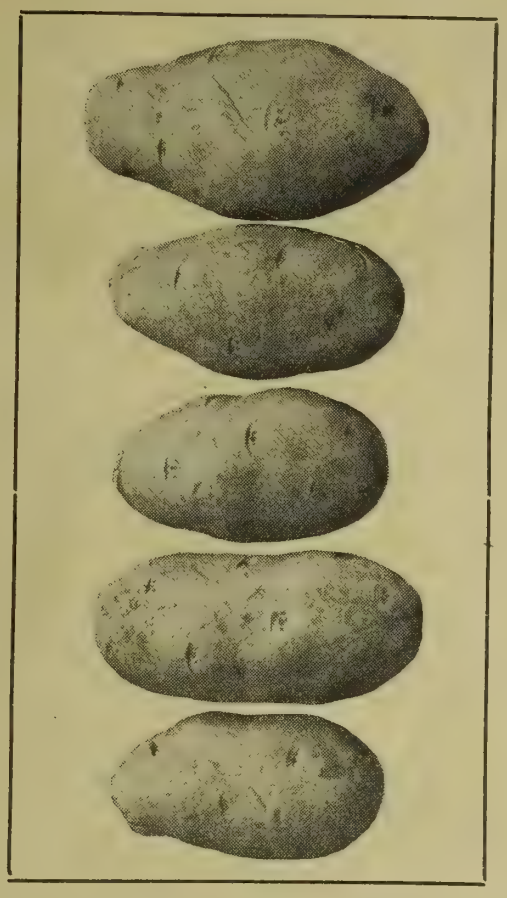
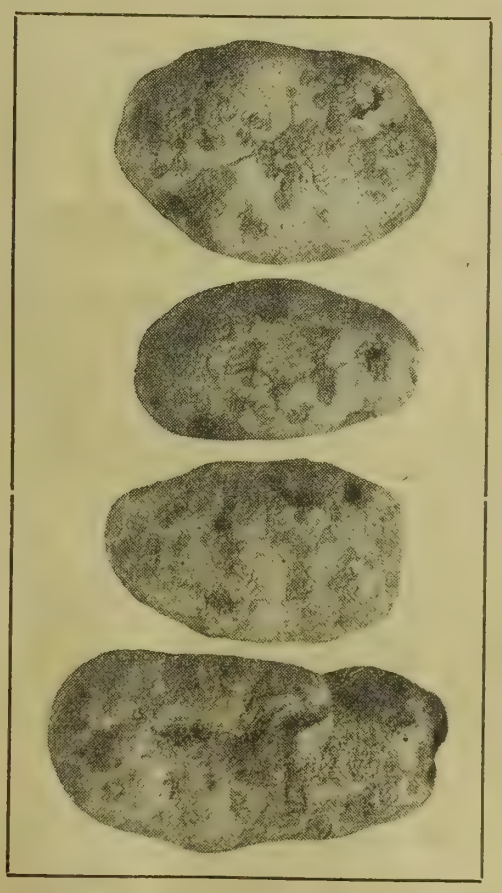
# For Potato Profits Use Agri Gypsum



*Unretouched photograph of clean potatoes treated with 1000 pounds per acre of Agri Gypsum. Crop harvested in winter of 1921 on ranch of H. L. Boyer, Van Nuys. Plot treated with Agri Gypsum yielded 61 per cent more and produced clean, marketable potatoes.*



*Unretouched photograph of scabby potatoes from untreated portion of check plot.*

At a total cost of $8.25 per acre for Gypsum and labor of spreading, H. L. Boyer, a farmer in the San Fernando Valley, increased the yield on his fall potatoes from 68 sacks in untreated plots to 110 sacks per acre in plots treated with 1000 pounds of Agri Gypsum to the acre. The quality is well shown in the illustration, potatoes from the Gypsum plot being practically free from scab, while those from the untreated portion were badly affected. Read Mr. Boyer's own letter describing his use of Agri Gypsum:

Van Nuys, Calif.,
April 18, 1922.

United States Gypsum Co.,
Los Angeles, California
Gentlemen:

We are enclosing two sample lots of potatoes which will illustrate the benefit I have received from the use of Agri Gypsum, at the rate of 1000 pounds per acre. The total cost was $8.25 per acre, Gypsum and the labor of spreading.

On the check plot test the yield without the use of Gypsum was 68 sacks per acre, while the plot to which Gypsum was applied gave a yield of 110 sacks per acre.

The ground is noticeably free from cut-worm, potato bug and other insects which are often found infesting the land after plowing under a heavy cover crop.

I regard this as a remarkable demonstration of the fertilizing qualities of Agri Gypsum when used on fall potatoes. I shall make a more extensive application on both my spring and fall crops.

Yours very truly,
H. L. Boyer.

Before planting your fall potatoes consult your nearest feed or fuel dealer for prices of Agri Gypsum and its uses.

## Agri Gypsum Good for Many Crops

Agri Gypsum is used extensively for Citrus, Deciduous and small Fruits; Vegetables; Forage and Cover Crops. Its principal uses are as follows:

1. As a fertilizer.
2. As a corrective and preventive of black alkali.
3. As a preservative of nitrogen in manure.
4. As a sanitary agent.
5. As a soil amendment and regulator.

## Percherons and ponies meet few farm requirements

There is a right size for everything you use for profit or convenience or pleasure on the farm.

In horses or motor cars, overweight means high first cost and heavy operating expense. Lack of size and stamina, on the other hand, brings risk of failure and discomfort.

Earl quality motor cars are built for everyday use in the country—although their low-sweeping lines and fine proportions make them noticeable on any city boulevard.

Big enough to carry five full-grown passengers in satisfying comfort anywhere an automobile can be driven, they are surprisingly thrifty of oil and gasoline. Their flexible, long-stroke motors develop power enough to handle any road condition. Yet on average highways, the Earl is more economical than any other car of anything like its size and riding qualities.

The over-all length of Earl touring cars is fourteen feet, less one inch. Their handsome green bodies are swung lower on longer and more resilient springs—56-inch rear—than in any other car of the Earl's wheel base or price—$1095. The road clearance is standard.

See the Earl before you buy your car. If there is no dealer in your town, write to Jackson for an illustrated catalog and the name of the nearest Earl distributor. At $1095, the Earl is the outstanding motor car value of the year.

# Annual White Sweet Clover

By Ernest Braunton

Few cover crops have in late years aroused the interest manifested in the annual strain of white sweet clover (Melilotus Alba), a biennial plant common to low gravelly soil and streams throughout the United States. earlier annuals usually respond well.

While this clover is comparatively new to California, a number of fields were found in Alabama where it had been cut for hay in the early part of June and which by the 15th of July had made a second growth of from two

**Hubam 100 Days from Planting**
One-third of area taken by trees; remainder will yield more than four tons of "hay" per acre.

The wild typical form is common in California and occasionally grows to a height of eight or more feet along water courses. The annual strain has been commercialized under the name of Hubam.

Last spring T. J. Walker of San Fernando bought three lots of seed for experiment, one in California, one in Iowa, and one in Alabama. All proved to be identical. The seeds were sown in drills, three feet apart on one piece of 18 acres, on April 13. It was photographed by the Cultivator camera, July 23, or just 100 days from planting. It was then five feet high, of splendid growth, stems small and well covered with leaves—an ideal feed. It is estimated that each of the 18 acres in the orchard will yield more than four tons of hay, and as but two-thirds of the area is occupied, if no trees were present the yield would run to about seven tons to the acre. It is believed the plants are rather too mature to produce a second crop, being in full flower, but if cut a little to three feet and were beginning to bloom. On the rich limestone soils of the Alabama "black belt" this clover can evidently be depended upon to produce both a hay crop and a seed crop the same year it is seeded.

A number of reports have been received from Oregon, Washington and California to the effect that this clover has made a growth of from six to eight feet the first year and produced a seed crop and that the roots have lived through the winter and have produced another crop the following year. Similar reports have been received from the south Atlantic coast states and a few isolated reports have been received from the center of the corn-belt where the roots have been unusually well protected. In other instances these plants have been reported to live through the winter when the clover has been seeded so late in the summer that it did not have time to produce a seed crop. The extent to which such results may be expected remains to be seen.

# Lye Peeling of Fruit

In response to request we are reprinting directions for lye peeling of fruit given in the Cultivator of August 20, 1921:

Paring peaches, pears and plums

with a knife cuts off and wastes a considerable amount of fruit even with the most careful and skilled paring, and careful paring takes a lot of time. Experts say the fruit next to the skin has the finest flavor, and this part is cut off and thrown away with the skin when a paring knife, however sharp, is used. The use of the paring knife adds unnecesary labor and is far less cleanly than when lye is used. So peel these fruits with lye.

The process of peeling peaches, pears and plums by dipping in hot lye solution is approved by the United

States government board of food and drug inspection, which reports that lye peeling has no bad effect on the quality or flavor of the fruit and is not contrary to the requirements of the food and drugs act known as the pure food law. Lye peeling saves time, fruit and trouble, is wholesome, rapid, cleanly and economical.

All you need is a good iron kettle big enough to hold plenty of water, a wire basket with side handle preferably, to hold the fruit.

To nine gallons of cold water add half a can of lye and a half ounce of alum. Bring to a boil. Have kettle large enough so that it is not over two-thirds filled with the water—this for safety to prevent splashing of the hot solution when the fruit is plunged into the kettle.

When the mixture is boiling, lower the fruit into the boiling solution in a wire basket container or in a thin but firm cloth such as cheese cloth. For smaller quantities of fruit use four tablespoons lye to one gallon of water with a pinch of alum added.

Let the fruit remain two minutes in the hot lye solution, then put it through two cold water baths to thoroughly remove the lye, and in the second bath of cold water rub off with the hands the small pieces of fruit skins that sometimes persist in clinging to the fruit.

### A COVER CROP STORY

This is a true story and it happened near Covina within the past month. It is set down just as told by the principals.

"One day I was giving a cover crop of sweet clover its first disking. At night I said to wife, 'This has been a nice cool day.' She said it had been very hot. The next day I was working on bare ground and at night remarked it had been a very hot day. Wife remarked: 'Why it has been much cooler than yesterday.' So, to note the difference I tested two thermometers to see if they agreed, placed one in middle of clover patch of good growth, on an orange tree; the other in a similar position where no cover crop was grown. At noon the difference between the two was 12 degrees!

"Now, I am satisfied by comparison that the plots having summer cover crops and well irrigated did not suffer from June drop as did the plots having no cover crop. Am also satisfied that cover crops in winter also keep the air cooler, and frost injury is greater than where no cover crop was grown. The cover does not allow the soil to absorb heat during the day, consequently it has none to radiate at night, wherefore my trees and crop are frost injured. So me for summer cover crop. Yet on my upper piece, which is fairly safe from frosts, I can also grow winter cover crops."

### COMPETITOR OF CALIFORNIA PRUNES

Prune crop in Bosnia and Servia for 1922 will be about 75,000 tons, double last year's production. Last year's exports from the two countries amounted to 3500 carloads, so it seems that that competition for California prunes may be counted on this season. Because of lack of storage facilities these prunes will probably be thrown on the market as soon as ready for shipping.

### GUMMING OF FRUIT TREES

R. R. Snowden writes: "Noting the prevalence of gumming of deciduous fruit trees in the coast states, let me say I have traced a connection between this condition and deeply covering the root crown, the same as I have proved to exist in citrus trees. In order to decide this question—for it appears to be a question with others than myself—would it not prove conclusive if you initiate a symposium on the subject? You could get the growers of the various fruits to examine their trees and note the depth of the root crown of all the gummed trees, and also of all the healthy trees."

(We shall be glad to hear from deciduous fruit growers in reference to the question stated by Mr. Snowden. If those growers who are troubled with gumming will follow out his suggestion of carefully examining all such trees and report their findings, it is possible that a preventive, at least, may be studied out.—Edit.)

# Look for DEPENDABILITY in the next tire you buy

Dependable tires will operate continuously day in and day out with little or no annoyance or tire trouble for the user.

Efficiency in handling farm goods without costly delays and interruptions demands a sturdy tire that will stand up and work loyally through dirt and mud and sand, over rough and rutty roads, in all kinds of weather.

The Savage Cord is such a tire. It is a Mighty Tire, with a tread that grips the road, does not skid, and wears slowly.

With Savage Cords on your car or truck you can start out any time, any place, under any conditions, with the assurance that you have the most dependable tire equipment money can buy—dependable because unusual care is exercised to build them so. We have incorporated *seventeen outstanding constructional features* into our Cord to make it the wonderful tire it is—ask your tire dealer about the Savage Cord, compare it with other tires.

The reliability of the institution manufacturing Savage Tires is further assurance that you will be satisfied.

Other good makes of tires may use one or more of the seventeen constructional features we have incorporated into the Savage Cord but no other tire that we know of begins to embody them all.

**WE GUARANTEE**

that not an ounce of shoddy or adulterants is used in the building of the

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Bean Troubles

We have received several samples of bean plants and bean leaves, grayish green in color, thickly dotted with minute brown spots. All have the same pest, bean thrips and red spider, and under that head in this department, all those interested will find the subject treated. We regret that by the time the trouble is noticed it is usually too late to save crop, but by close watch and timely spraying another year, crops may be saved.

### Autumn Irrigation

I intend to irrigate my peach and almond trees this fall after crops are off. Kindly tell me when is the best time to begin. Do you advise fall irrigation?—Subscriber, Acampo.

To answer the last question first: We do. Too many seem to think that when the present crop is borne trees have nothing further to do. But fruit growing is the "supreme effort" and uses all the vitality the tree will yield. When does it recoup and reestablish vigor for next season's effort? It must store food to put forth a vigorous growth next spring. It does this after fruits are off. Every green leaf manufactures food which descends and is stored until the warmth of spring calls it forth. The object of fall irrigation is simply to keep the tree going until this season's work is done. So long as a green leaf remains the tree is functioning. Irrigate as soon as crop is off, but do not keep it up until green succulent growth is induced for early frosts to catch.

### Locating Homestead

I am planning on taking up a homestead. Can you tell me where to look for some good land and location in northern or central California? I want to raise some crops, fruit and cattle. Can I borrow money under the farm loan act? Where can I find out about it?—Subscriber, Nipomo.

There is very little good agricultural land available for homesteading in central or northern California, excepting in rather small tracts or in isolated places. Any of the government land offices can supply information regarding homestead laws, but do not supply information as to the whereabouts of vacant land. You are supposed to look up any vacant land in the location you desire and the land office will then advise you whether or not it is open to entry. There are land dealers who make a business of looking up vacant land, and they usually charge $1.00 per acre for locating claims. We can not, however, vouch for the reliability of such concerns. We do not think that it would be possible to borrow money on a homestead until a patent for same has been issued.

### Rhizoctonia on Beans

I am sending some pink bean vines. I have 180 acres, and thousands of plants are dying. Can you tell me what the disease is, the cause, and the remedy? This is fifth year in beans on same ground. I have irrigated them three times. Those still unaffected seem to be all right except beans are slow in setting.—Subscriber, King City.

Bean plants appear all right, but sadly lacking in small feeding roots. These have evidently died and dropped away, for tap roots in all plants sent were dead and dry at tips, some evidently so for weeks. This is clearly rhizoctonia, a soil fungus, resident in the soil, and for which no remedial measures can be taken. Weather conditions are largely responsible, and low, damp land is most susceptible, especially heavy soils. You can do nothing except "trust to luck." It is not good practice to grow beans on same land continuously for five or more years.

### Bone Meal

Will you please tell me how and when to apply bone meal to pot and other plants, the quantity to apply, and should the soil be dry or wet? How often can be it used? Does it take the place of other fertilizers? Would like to know all about it.—Subscriber, Tulare.

The use of raw bone meal is not advised for any crop, in pot, garden or field, if results are wanted the same season. No bone is ground fine neough so that any considerable per cent is readily available and this has to decompose. Bone meal is for the future or years to come. It does not take the place of "other fertilizers," as it is used chiefly as a source of phosphoric acid, of which high class bone, free from fat, should contain 22 per cent, also four per cent of nitrogen. Bone meal is not recommended for pot and garden plants. Dried blood, which may be had at seed stores, etc., is much better, much higher in nitrogen —which is chiefly to be desired—and enough phosphoric acid. As to availability of nitrogen, it is also to be preferred to any bone meal.

### Autumn Strawberries

Answering the question as to how strawberries are handled to secure late summer and fall crops, we would advise that it is a question of rest and control of water supply. Plants are not given more water during summer than is needed to keep them alive without impairment of vigor. Naturally texture of soil, climate, etc., will determine how often water should be applied, and how much at a time. It is a matter for each grower to find out for himself. General directions for a coastal district on a certain soil might be disastrous for an inland district having distinctly different soil.

### Carob Trees

Would like to get information about carob trees and their possible future as a paying proposition. Would be glad to see articles in Cultivator on the subject.—Subscriber, Fillmore.

The carob tree as a source of profit for stock food, by using the edible pods, is full of promise, judged by what has been accomplished in other countries with climates similar to that of Southern California. Heavy frosts injure young trees in cold sections, and many of good size were killed in the first months of 1913 and 1922. In the light of present knowledge it is not advisable to plant seedling trees from any and all sources, perhaps not from the best trees, for all seedlings are an unknown quantity. Budded trees or cuttings, from trees of known and approved crop record, planted in warm localities, are a promising investment, but of this we hope to print more before planting season.

### Pruning Blackberries

Is this the proper time to prune blackberries? Mine have ceased bearing for this season, and I am con-

Stewart MOTOR TRUCKS

Stewart Utility Wagon

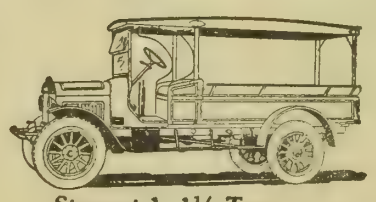
Announcement!

We have secured the franchise to distribute Stewart Motor Trucks in this city and vicinity.

Before making the selection of the Stewart line, we made a searching investigation of the truck field for a suitable line of trucks which would uphold our reputation, and also hold up under hard service.

Stewart was our choice because we found that in the long run, they are most economical to buy and maintain. We learned that many concerns operate large fleets of Stewarts. They are being used daily in over 800 cities, on thousands of farms and in 41 foreign countries.

Just a word about "service." When we sell you Stewart Trucks we will not only sell you the vehicles, but the proper service to see that you get daily use of your trucks in your transportation department.



Stewart 1- 1½ Ton

6 Sizes—¾, 1, 1½, 2, 2½ and 3½ tons

"The Stewart Truck has won--
by costing less to run."

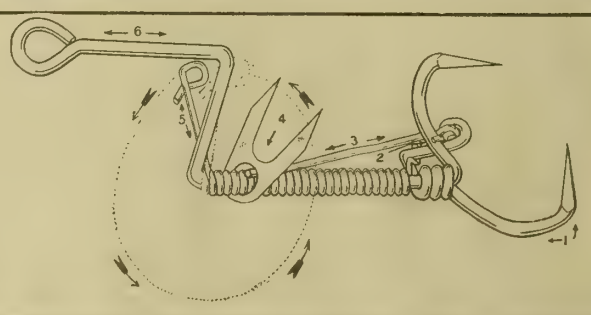
GETS THE GOPHER



GETS THE MOLE

Farmers! You may now rid your fields of these pests. New Way. Others are averaging 95 gophers and moles caught out of every 100 Death-Klutch traps set. Write for illustrated circular. Death-Klutch Trap Co., Dept. C., Winfield, Kans.

sidering pruning them. I know little about it.—Subscriber, Gardena.

Do not prune any plant while good live green leaves remain. They are making and storing food for next year. When a majority of leaves have changed color, ceased to be green, it is soon enough to prune. Style of pruning has of recent years been considered of secondary importance. Any reasonable pruning, with good care otherwise, will result in good crops. Economic measures in culture, harvesting, etc., are determining factors. Four or five good canes four feet high, with laterals cut back to one foot, is favored by many. Spring pinching of young growth is indulged in by those having few vines, to restrict growth.

### Siberian Millet

Am sending you a bunch of grass for name and estimate of value as stock food. This plant is but five weeks old, yet seed is ripe.—Subscriber, Devore.

This "grass" is variously known as Siberian Red proso or millet, Indian millet, hog millet. It is of good value for stock food.

## SPRAY AND THIN FOR BETTER FRUIT

(Continued from Page 149.)

per cent for long pruned. During 1922 the costs of all operations were recorded but as this plot was neither irrigated or fruit thinned costs of operation and financial returns are not comparable with those obtained under intelligent orchard practice. As it was but a single experiment, at an experiment station, for experimental purposes, the results or the purpose of the experiment would not interest the average fruit grower.

### M. Shapovalow

Pathologist, United States department of agriculture, was called upon to report regarding projected work on tomatoes. He is here to make a special study of the "western yellow blight" common from Utah to the Pacific and from British Columbia to Mexico. The cause is yet to be determined. If in the soil a remedy may be found; if inherent in the plant it may be hopeless. Babcock and Leslie of the state university are working on resistant varieties. One grower has set aside 20 acres for use of government experimenters. One field of 65 acres in Riverside County has already suffered a 50 per cent loss.

### R. B. Peters

President of the San Bernardino farm bureau, said canners and growers were about 50-50 to blame for poor conditions in the industry. Growers in his county received from $10 to $50 a ton for 'cots. Quality and not quantity should be the aim of all. More of a premium must be put on good fruit than is case at present. "Spray and thin" should be the slogan of the grower.

### H. J. Wilder

Farm advisor of San Bernardino County, said effective thinning and disease control through spraying were the factors that augured success. Few growers either thin or spray enough.

### M. M. Winslow

Farm advisor of Riverside County, stated his county contained 1,000,000 apricot trees, the largest number of any county and one-sixth of all in the state. Canners should demand better fruit and so adjust prices as to encourage its production. All farm advisors would aid the movement.

### D. H. Gates

Of the Banning Canning Company thought some farm advisors had "fallen down" through "scattering" demonstrations over too many places year by year instead of carrying out work on same trees year by year so results would be cumulative and conclusive. Pruning, etc., should be performed by same man or men each year—uniformly programed work. (This is precisely what is done in all counties where the Cultivator has investigated and followed the work.—Ed.). What is wanted are apricots that run 8-10 to the pound instead of 30-35 to the pound. One 2½ inch peach weighs more than two 2 inch peaches.

### W. S. Rosecrans

President of Los Angeles County farm bureau, emphasized the point that the bureaus and the farm advisors were entirely distinct though working together. Growers must be convinced that good fruits are more profitable through far better prices than they can obtain for poor fruits. Fruit contests are desirable as stimulative to better conditions. Many growers are suspicious or distrustful when approached; they think one has something to sell or "an axe to grind." Caution is needed and he must be shown by results that it is to his interests alone to produce better fruits.

### S. W. Cunningham

Secretary of the Southern California Canners Bureau, was the last speaker. He said that 75 per cent of Northern California deciduous fruits went into the better grades; but 27 per cent of Southern California fruits were admitted to same grades. The increase of production of deciduous fruits over the previous year has been two to three per cent. The southern counties will market this year about 60,000 tons of fruit at the canneries, in addition to tomatoes, etc. The canning peach must be a cling. He suggested a committee appointed from all the agencies and interests present, to meet occasionally to discuss ways and means to bring desired results—better fruit. He thinks such committee should determine the best time to spray, as this differs with seasons, and be prepared to send this information out at once to all who need it. He said spraying and thinning is all that is needed, in addition to good orchard practices now generally in vogue, to insure better fruit.

In closing the meeting Chairman Campbell said arrangements would be made for a conference of all interested parties present, that an organization would be formed, the work of which would be educational and its slogan: "Spray and thin for better fruit."

A&M MELILOTUS INDICA
The Economical and Satisfactory COVER CROP

Bulletin on Melilotus Indica issued by the California State Agriculture Department says: "It has increased the yield of the crops to a greater extent than any of the other legumes tested." The same report shows Melilotus Indica gave an average increase of 64.8% with its nearest rival but 43%.

A. & M. Melilotus Indica seed grown in California is free from weed seeds—99½% pure.

"The Nursery That Helped to Make Santa Clara County Famous"

# What Will You Need in Fruit Trees This Year

It's time right now to figure on your requirements. There are considerably less trees on the market this year than there were last, and it looks like a much greater demand. If you want first and best choice of stock, you should have us reserve your order at once.

*Ask About Our Special "Early Order" Offer*

It's the fairest offer ever made by a nursery concern. Not only does it protect you in the way of price, but it guarantees you the highest quality of trees that can be grown. This special "Early Order" offer covers all standard varieties, including:

**Prune Pear Peach Apricot Nectarines Fig**
**Plum Grapes Berries All Small Fruits**
**Quince Olive Orange Lemon**
**Lime**

SPECIAL NOTE: If you are interested in nut trees, ask about our famous Payne Seedling, the most profitable commercial walnut on the market today. Tell us how many trees you want, state the variety, and get our quotation, together with the special "Early Order" offer.

# Herbicide Kills Weeds Cheaply, Effectively

**Satisfaction Guaranteed**

Destroys, **absolutely,** all pest weeds, noxious grasses, vines, shrubs, including Johnson, Bermuda, Morning Glory, Crab, Nut, Bronco, Water Grasses, Malva, Thistle, and all other noxious plants.

Herbicide is a triumph of modern science. It is a combination of chemicals, which, when sprayed on the foliage, permeates the entire sap system of the plant, and kills it root, branch, seeds and all. Inasmuch as the seeds, also, are killed, your next season's crop of weeds will be lighter and eventually you will banish them entirely.

Herbicide is extremely economical and easy to use. Does not require a professional sprayer. Far cheaper and more effective than hand labor with a hoe. To save freight we ship in concentrated form—one gallon makes ten gallons of spray. This is one of the reasons why Herbicide is a more economical spray to use.

Herbicide is tried, tested, proven. It cannot fail to remove noxious weeds in the cheapest and most effective manner known. **Now is the time to kill them.** Enrich your land by removing worthless weeds which sap the soil.

Write for prices, today.

### OLD POEMS REQUESTED

THE Cultivator is glad to give in response to requests of readers, reprints of such old poems as have been found in search through a large library. Many, we regret, could not be found. We are still looking for some requested weeks ago, and if we can secure them they will appear later in this department.

#### The Last Charge

I am anxious to get two songs that I used to know, and I wonder if you would be so kind as to print them soon in the Cultivator? I do not know the author of either one. "The Last Great Charge," is one; the other starts this way:

"From this valley they say you are going.
I will miss your bright eye and sweet smile."—Subscriber, Elverta.

We print below the poem "The Last Charge" which we presume is the same as the one the subscriber has in mind. We were unable to locate the other poem requested. We searched through the index to first lines of poems in the public library and found no poem beginning with these words. If we had the correct wording or author's name or title of poem we might be able to locate it.

#### THE LAST CHARGE

**By George B. Hynson**

Napoleon's address to the "Old Guard" at Waterloo, and their Final Defeat.

Now, comrades, as ye love the hills
And vales of Sunny France,
Sweep down upon the tyrant foe,
With lightning speed advance!

Your wives and little ones at home
Are hanging on your fate,—
Shall they be governed by your love,
Or ruled by tyrant's hate?

Remember on your action now,
Your lives and mine depend;
And they are not so dear as those
We're fighting to defend.

Let all be borne before your charge
Like foam upon the crest,
And every soldier of the "Guard"
Present his gallant breast.

Remember that the "Guard" can die,
But never can surrender,
Then let this be the battlecry,
And France—May God defend her!

On many a hard fought battlefield
We've held them all at bay.
Remember this, my gallant lads,
France fights the world today!

See Blucher and his Prussian host,
Can they withstand the shock?
Then every steed must be a stone,
And every man a rock!

Just follow where your marshal leads,
And you will win the day—
The "Bravest of the Brave" is he,
The bold, intrepid Ney.

And as Napoleon hurries on,
A thousand echoes stir,
As every soldier's throat responds
"Long live the Emperor!"

With banners floating in the breeze,
And mustering thousands strong,
All silent as the hush of death
The phalanx moves along.

Upon their charge Napoleon risks
His life, his throne, his all!
If they are driven from the field,
Then he and France must fall.

The thrones of monarchs totter now;
The world looks on aghast;
The earth is being battled for;
The awful die is cast!

As tempests sweep along the sea
All unresisted on,
So sweep they 'long the battlefield
With every sabre drawn.

Again the echo sweeps along.
Who is worthy of their steel!
Each charge is met with counter charge
The "Guard" begins to reel!

Again they rally from the shock;
And yet again recoil,
And whole battalions now are stretched
Upon the bloody soil.

Undaunted yet—unconquered still,
The broken lines reform,
And once again are driven back
Before the leaden storm.

When through the battle's fire and smoke,
Through corpses making way,
Through broken lines of cavalry,
Comes noble, fearless Ney.

Now, comrades, one more stroke for France,
By all your love for her!
Again the echo sweeps along.
"Long live the Emperor!"

And again they thunder in the charge;
Again the foemen yield,
And now the bold, heroic "Guard"
Is master of the field.

As chaff along the threshing floor
Is borne before the wind,
So back the Prussian host is swept,
Their wounded left behind.

But now the tide of war recedes
As fast as it has flown;
They struggle—rally once again,
And still they hold their own.

And now they forward sweep to give
The last and deadly shock,
As waves approach a foam-lashed shore
And beat upon the rock.

For through their lines, with deadly power,
Comes plunging shell and ball,
And lines of demons cannot charge
Where whole battalions fall.

Ah! England, you have France again
In your relentless toils;
Napoleon's power is broken, now,
The stubborn "Guard" recoils.

Ah! men of France, the day is lost;
You've fought the battle well.
No human power could break those ranks,
Could storm the gates of hell!

The God of nations wills it so,
Then bow beneath his rod;
Commend yourselves to England, yes,
To England, and your God.

#### Gipsy's Warning

Will the Cultivator kindly publish for me the words of an old song, "The Gipsy's Warning," also another which begins something like this "Just a year ago tonight love—I became your happy bride."—Subscriber, Fullerton.

The words to the Gipsy's Warning we found in "Kavanaugh's Exhibition Reciter," published by Dick and Fitzgerald, New York. It is given in the form of a musical tableau—air from "Martha." We could not find a poem beginning with the words as quoted above, "Just a year ago, etc." There were several poems with titles such as "A Year Ago," by Percy C. S. Smythe, and "Only a Year," by Harriet Beeceher Stowe, but neither of these gave the words as suggested above. Perhaps the line quoted should begin with some word other than "Just."

#### THE GIPSY'S WARNING

Do not trust him, gentle lady,
Though his voice be low and sweet;
Heed not him who kneels before thee
Gently pleading at thy feet.
Now thy life is in its morning,
Cloud not this thy happy lot,
Listen to the Gipsy's warning,
Gentle Lady! trust him not.
Gentle Lady! trust him not.

Keep thy gold—I do not wish it.
Lady, I have prayed for this;
For the hour when I might foil him,
Rob him of expected bliss.
Gentle lady, do not wonder
At my words so cold and wild.
Lady! In that green grave yonder,
Lies the Gipsy's only child.
Lies the Gipsy's only child.

Do not turn so coldly from me,
I would only guard thy youth
From his stern and with'ring power;
I would only tell the truth.
I would shield thee from all danger,
Save thee from the tempter's snare.
Lady! shun that dark-eyed stranger!
I have warned thee—now beware!
I have warned thee—now beware!

Lady! once there lived a maiden,
Pure and bright and like thee—fair;
But he sought, and wooed, and won her,
Filled her gentle heart with care.
Then he heeded not her weeping,
Nor cared he her life to save.
Soon she perished! now she's sleeping
In the cold and silent grave.
In the cold and silent grave.

### NEW FRUIT BEVERAGES

(Continued from Page 149)

an equal quantity of orange juice and grape or other juice sweetened to form a heavy syrup. We have used red wine grapes for the purpose. In one experiment we used a commercially prepared red grape syrup and a citrus syrup consisting of about one part lemon juice, three parts orange juice and 12 pounds sugar per gallon. The three juices and the sugar give a fruit punch syrup that has proven very satisfactory when bottled and carbonated as a soda water. Various other combinations of citrus and other fruit juices have also proven successful in our experiments. The citrus juices alone we have not found so satisfactory because of the fact that they deteriorate in flavor.

#### Sale of Carbonated Beverages

"The proof of the pudding is in the

eating." This proverb applies to fruit juices as well as to other things. In order that we might obtain data upon how the public would respond to our drinks we placed them on sale at the University Farm Picnic in April of this year. We were agreeably surprised that the children as well as the grown ups "made a run" on the drinks and put us out of business in less than three hours by consuming our entire supply. We have "tried them out" also on the faculty and their families at the University, and are now preparing to offer the drinks for sale in Berkeley. Preliminary results on the sale of these drinks indicate that they will be well received. We will make at least 5000 bottles of various fruit beverages this summer and obtain a more definite idea of what the public will pay for the drinks and what their opinion is of them. We have been selling the drinks at ten cents per soda water bottle, and find that no one objects to this price. This would correspond to about 40 cents per quart, which, when compared to about 90 and 95 cents a quart for most fruit juices is a very moderate price to the consumers.

### Cost of the Drinks

With strawberries at eight cents a pound, and sugar at six and one-half cents, we find that the cost of the materials necesasry to make an eight ounce bottle of real "honest-to-goodness" fruit beverage is 9/10 of one cent per bottle. If this drink cannot be sold retail at ten cents per bottle then there is something wrong with our distributing system.

### How to Make Fruit Drinks at Home

The editor has asked us to give simple directions for the home preparation of the fruit juices. Although the average home does not have a bottling outfit the fruit syrups can be prepared very readily in the home without special equipment.

### Home Made Berry Syrups

Loganberries are best, but blackberries, strawberries or raspberries can be used. Use only fresh berries. Sort them carefully, wash them thoroughly and drain. Crush them in an aluminum or agate ware dish with a potato masher or a bottle, insert a thermometer and heat the berries with water to 150 degrees Fahrenheit, or if you do not possess a thermometer heat the berries almost to the simmering point. Draw them through a berry bag and strain off the juice, twist the bag or place it in a fruit press to get the remainder of the juice. Strain the juice through a jelly bag until it is fairly clear. To half a quart of juice add three pounds sugar and dissolve by warming and stirring. Pack the juice into bottles and seal, leaving one inch space in the top of the bottles unfilled to permit expansion of the juice during sterilization. Or use glass top fruit jars and seal the jars. Place the jars or bottles in a horizontal position on the false bottom of a wash boiler sterilizer, covering the bottles completely with water. Heat the water to 175 degrees Fahrenheit for 35 minutes, remove the bottles or jars and store in a cool place. The ordinary grape juice or soda water bottles can be used if you obtain from your local hardware store a crown capping machine. Since the passing of the eighteenth amendment these crown cappers can be obtained in any community. These syrups can be used in a number of ways. One of the best is to mix them with a little lemon juice, cracked ice and water, to make fruit punch. Orange juice and sliced oranges and sliced bananas can be added to the punch to improve its flavor and appearance. Another good way of serving the drinks is to mix them in the glass with carbonated syphon water. Bottles of syphon water can be purchased from any drug store.

### Home Made Syrups from Citrus Fruits

Oranges and lemons are in season most of the year, and there is really no necessity for putting up these syrups although if you desire to do so you can make a fairly good citrus fruit syrup as follows:

Cut one pound lemons and three pounds oranges, or other amounts of the fruit in this proportion. Quarter and press in a fruit press. To the juice so obtained add three pounds sugar per quart and pasteurize. Then proceed as directed for berry juices. This syrup is excellent for mixing with

# Golden Jubilee Catalogue

## Is Now Ready for You

Fifty years' experience in making low prices, in selecting worthy, serviceable goods, and offering them at a saving, has gone into the making of this big complete Golden Jubilee Catalogue.

Your FREE copy is waiting here for you. To write for it today is to learn the lowest price you need to pay for everything you need for the Home, the Farm and the Family.

**There is a Cash Saving of at Least $50 for You**

Getting the right price today is a matter of choosing the right place at which to buy. To know the lowest price, to get the actual market price on everything you buy, will mean a saving of at least $50 on your needs and your family's needs this season.

Montgomery Ward & Co. quote the lowest prices possible on new, fresh merchandise of serviceable quality. We do not sell cheap unreliable merchandise. We do sell good goods at the lowest cash prices of the year. To buy from Montgomery Ward & Co. is complete assurance of Satisfaction and Certain Saving.

**Everything for the Home, the Farm and the Family**

**For the Woman.** Are you interested in New York styles, the newest styles? Ward's own fashion experts have selected in New York everything for you and for your children — coats, suits, dresses, hats and shoes, and all are offered to you at a big saving.

**For the Man.** Do you want full value for your dollar? All your personal needs, everything from clothing to a good cigar, is offered you at prices that bring you the greatest return for your money.

**For the Home.** Everything that goes to make the home modern and pleasant, rugs, wall paper, furniture and home furnishings are shown in this catalogue at prices that save many dollars.

**For the Farm.** Everything the farmer needs—tools, roofing, fencing, paint, hardware, of guaranteed dependable quality —at amazingly low prices.

Every item in this catalogue is guaranteed exactly as pictured and described. Your money back if you are not entirely satisfied with everything you order.

the berry syrups or grape juice in making punch.

### Home Made Grape Syrups

Use equal amounts of Muscat and red wine grapes. Crush them thoroughly and heat to 150 degrees Fahrenheit, press and strain. To this juice add about six pounds sugar per gallon or 1½ pounds per quart and pasteurize as directed for berry syrup. This syrup is used in the same manner as suggested for berry syrups.

### Home Made Syrups from Pomegranates

Pomegranate skins and pulp contain a large amount of tannin, and if the whole fruit is crushed and pressed the juice will be puckery. We, therefore, recommend that the kernels or arals be taken from the pomegranates by hand. These are then crushed and pressed without heating, and the juice is then heated to 150 degrees Fahrenheit for about five minutes in an aluminum or agate dish. The next morning it is separated from the sediment and strained. Two pounds sugar per quart of juice is added and the syrup so made is pasteurized as directed for berry syrup. It is used in the same manner as the berry syrup.

### Small Scale Carbonating and Bottling

If there is a bottling works in your neighborhood, and you are on good terms with the bottler you can take your syrup to him and ask him to place about 1½ ounces of the syrup in each soda water bottle, of the grape and pomegranate syrups, or one ounce of the berry syrup or citrus syrup. Ask him to fill the bottles then with carbonated water and to seal them for you. You can then take them home and place them in your wash boiler sterilizer, completely immersing them in the water. The bottles should be placed horizontally. Heat the water to 160 degrees Fahrenheit for 30 minutes.

### Be Careful

Tip the water out of the boiler until the bottles are exposed and allow the bottles to cool in the boiler with the boiler uncovered. Do not handle the bottles while they are hot, they may burst with such violence that they will sever a finger or a hand or seriously cut the face!

## HOUSEHOLD QUERIES

### Hard Soap Without Boiling

I have been told there is a way of making hard soap without cooking it. Can you tell me how it is done? I would certainly like to get rid of the bother of boiling the soap kettle if I could.—Subscriber.

First clear your grease of salt and impurities by putting in clean vessel and adding about twice as much water. Let come to boil, then cool. The clean grease may then be skimmed from the surface, salt and scraps falling to bottom. Now empty one freshly opened can of any good lye into an earthen, agate ware or iron vessel (not aluminum) containing one quart of cold water and stir with a spoon or stick. The lye will dissolve quickly and the water will become quite hot. Allow it to become cold. Then take six pounds of clean grease, tallow, lard or drippings, free from salt, melt in an ordinary can or kettle (not an aluminum vessel) and cool until lukewarm. Then pour the cold lye gradually and slowly into the melted grease (not the grease into the lye) in a thin continuous stream, stirring constantly and vigorously until they are thoroughly mixed and drop from the stirrer or ladle the thickness of honey. It takes from a quarter to half an hour. Then pour the mixture into a wooden or a strong pasteboard box. If wooden box is used it should be lined with paper. Cover the soap and set in a warm place for a day or two, when it can be cut to any desired shape, with thin twine, a fine wire or a knife. This gives about 10 pounds of soap of excellent quality.

### Dill Pickle Recipe Last Week

Please print directions for fixing dill pickles.—Subscriber, Chatsworth.

An excellent recipe will be found on Page 133 of last week's Cultivator, the issue of August 5.

### String Beans in Salt—Apple Butter—Dill Pickles

Will you please give recipe for making dill pickles like the ones found on the general market, or as nearly as possible the same? Also recipe for making apple butter. Also if there is a way to put green string beans down in salt to keep fresh for winter and what proportion of each?—Subscriber, Woodlake.

Directions for making apple butter will be found on Page 61 of the Cultivator of July 15; for dill pickles on Page 133 of the Cultivator of August 5. Copies have been mailed to inquirer.

Keeping String Beans in Salt.—These directions are taken from Cruess' "Home and Farm Food Preservation:"

String beans are prepared and broken as for cooking. Weigh one pound salt to each 4 pounds vegetables. Place a layer of salt in bottom of crock or barrel or wooden tub. Do not use metal containers. Build the vegetables and salt up in alternate layers until the container is full. Cover last layer of vegetables with a layer of salt. Place a false wooden head small enough to set inside the container on top of mixture. Place a heavy weight on this head. Leave until the liquid is forced out of the vegetables and they are immersed in the brine formed by their own juice and the salt. This will be in about two weeks. Remove the false head and weight and seal with paraffin to prevent evaporation of the liquid. The vegetables will keep indefinitely and retain much of the original appearance and flavor of the fresh vegetables. To use soak in large volume of water over night; for example, by suspending them in a cheese cloth bag near the surface of a large pot of water, or parboil to remove salt. Then cook and prepare for the table in the usual ways.

# A remarkable mileage creates a Red-Top enthusiast

A RED-TOP was turned in at a garage in Omaha, Neb., worn all the way through, and the jubilant owner asserted it had run for four years, 35,542 miles by his speedometer. It had never had a puncture—simply worn down to the tread and rolled along until it wore through all the plies of fabric.

He offered to make affidavit to the truth of these statements, and volunteered the information that the mate of this Red-Top was still on the other wheel, and looked good for hundreds of miles more.

This is exceptional—but the extra ply of fabric and the heavy, specially compounded red tread of the Red-Top is continuously creating mileage records on small cars under rough road conditions that are astounding to users of other tires.

*There's a Fisk Tire of extra value in every size, for car, truck or speed wagon.*

Extra Ply of Fabric

FISK RED-TOP CLINCHER TIRE

Extra Heavy Tread

## AUGUST IN THE VEGETABLE GARDEN IN SOUTHERN CALIFORNIA

By D. F. Reichard

THE Southern California gardener is a busy man during this month. He has to make ready for his winter vegetables. Making ready for sowing seeds at this time of the year is a particular thing in this section. The big thing is to get ample moisture into the ground and still have the soil in condition to induce proper germination. This condition is attained by thoroughly soaking the ground until the top moisture reaches the submoisture, which in the cultivated ground is from 12 to 24 inches under the surface. There are different methods of applying the water; in small gardens usually by running the sprinkler for several hours at a time, in larger areas by either the flooding system or by allowing the water to run slowly through furrows. As soon as the ground can be gotten on without sogging, cover the surface with a complete fertilizer running about 5 per cent nitrogen, 8 per cent phosphoric acid and 1 per cent potash. As soon as the ground can be worked up without sticking to the tools, spade or plow it as deeply as possible and thoroughly pulverize it so as to get the fertilizer well mixed into the soil and to eliminate any large air spaces which would be caused by clots. In soils that were dried out completely with the growing of a spring crop it is advisable to do this irrigating and working up of the soil twice before attempting to sow seeds at this time.

During the summer months seeds should be covered about twice as deep as when sown in the spring because of the extra amount of evaporation that is going on at this time. Small seed like lettuce, carrots, cabbage and onions should be covered 1½ inches, while radishes, beets and parsnips should be covered 2 inches. Peas, beans and corn sow in the bottom of shallow furrows, covering the seed 2½ to 3 inches. One thing to be careful about when sowing these latter items is to not have the soil too damp, particularly with peas, for they will often mildew before germination takes places and the seed will decay.

The following small seed crops can be more successfully grown if sowed in ridges so that water can be run on either side to soak into the seed without making a cake over the top of it: beet, carrot, lettuce, turnip, parsley, parsnip, endive, chard, kohlrabi, radish, spinach, kale and cabbage.

Sweet corn, summer squash, cucumbers and bush string beans can be sown during the early part of the month with assurance of making a crop in most any section, while in frostless sections they can be sown even into next month.

The principal planting of winter potatoes is made between August 1 and 15. Plant on the level four or five inches deep. It will take them three or four weeks to come up. When they are up enough to show the rows, cultivate, leaving a small furrow between the rows, and as soon as they need water irrigate down these rows, after which cultivate when ready, leaving a little larger furrow in which to irrigate later. Continue this method until your crop is made.

It is too late, except in very favored spots, to sow pole beans, watermelons and muskmelons and pumpkins; it takes too long for them to mature.

Remember that at this time of the year the sun is working full time, taking moisture from your growing plants and the ground, and that it must be supplied by you through some method of irrigation; also that insects and disease are always waiting to make an attack. Keep on hand preventives and cures for immediate use when needed.

Keep the surface of the ground well stirred to keep down weeds and conserve moisture.

## ARMY WORMS PLAGUE IN MADERA

Advices received by the California department of agriculture from George Marchbank, county horticultural commissioner for Madera, show the army worms to be more prevalent than heretofore. Daily calls for information and aid have kept the commissioner's office busy. The most popular method of repression appears to be that of isolating a vineyard by a trench or furrow and destroying the accumulated worms by burning oil.

Where the Spinx moth, mildew and army worms occur simultaneously a combination spray of lead arsenate, nicotine sulphate and sulphur has been employed. Even in the outlying foothills, hordes of army worms are feeding on wild shrubbery.

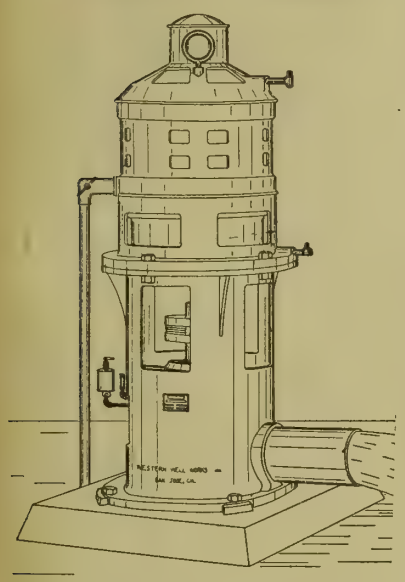
## ALMOND EXCHANGE CLOSES MEMBERSHIP

The membership rolls of the California Almond Growers' Exchange will close on August 15. The directors state that this step is taken to protect the position of the exchange in the market, as many growers otherwise hold back to the last moment, hoping to make more advantageous independent deal.

## DECIDUOUS GROWERS ARE ORGANIZED

The Deciduous Fruit Distributors of Southern California have completed their organization. They start with 2,000 acres of apples signed up, and expect to handle other deciduous fruits as membership increases. Five associations are now affiliating: Costa Mesa Fruit Growers; Chino Valley Apple Growers; Yucaipa Apple Growers; Independent Fruit Growers, Yucaipa; J. H. Strait Co., Redlands. R. B. Peters of Devore will be acting president and general manager. Present headquarters are in office of San Bernardino County farm bureau.

## Western Turbine Centrifugal Deep Well Pumps



represent a highly developed construction of a simple practical pump. They are manufactured to meet rigid inspection and deliver long uninterrupted service. The cost of maintenance is very small over many years of severe use.

# Save on Painting

## There's One Way to Do It. It is This

THE only method by which you can save on the cost of painting is to paint your buildings and equipment when they need it and to use the best paint for the purpose.

Paint makes repairs unnecessary. Paint costs *less* than repairs. Therefore you save by painting when your property needs it.

The best paint spreads more easily—it saves on labor cost. It covers more area per gallon than "cheap" paint.

But most important, the best paint serves five or more years longer than "cheap" paint. The best paint costs less in the long run.

We've made the best house paints for 73 years. They contain the finest materials. For example, the white lead we use—PIONEER WHITE LEAD—is super-purified and ground so fine that it will pass through a silk screen with 30,000 meshes to the square inch.

Pure linseed oil, pure zinc, and pure colors—materials of the finest quality are combined in Fuller's House Paints in scientifically exact proportions with long-time skill.

**House Paint:** Fuller's Pure Prepared Paint, Phoenix Pure Paint, for painting houses. The purest, best protective and most durable paint manufactured—32 colors.

**Barn and Roof Paint:** A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality—6 colors.

**Floor Paint:** Fuller's Rubber Cement Floor Paint—a sanitary, waterproof and durable paint for floors of kitchens, closets, etc. Attractive in color and gloss. Dries hard over night—12 colors.

**Implement Paints:** Fuller's Pacific Wagon Paint, adapted for repainting agricultural implements, farm wagons, farm machinery, wind mills. A glossy, durable finish—7 colors.

Also makers of Fullerwear, an all-purpose Varnish, Silkenwhite Enamel, Fifteen-for-Floors Varnish, Decoret, Washable Wall Finish, Auto Enamel, Fuller's Hot Water Wall Finish (kalsomine), Porch and Step Paint, Silo Paint, Milk Can Enamel, PIONEER WHITE LEAD, Tractor Paint, and Fuller's Oil Stains.

### Advice on Painting FREE

If you want to do your own work and get the best results, ask our Specification Department for *free advice.*

We'll tell you how to treat old paint, how many coats to use, what kind of brush, etc.

Use *Fuller Service* as well as Fuller Paints and Varnishes to insure good work.

## Fuller's SPECIFICATION Farm Paints

# California Breeding Farms

By Jack Klein

## THE MEADHART HOLSTEINS

FOR the past three years in practically every big sale of tuberculin tested Holsteins in this state the top cows have been knocked down to Fred Hartsook of Lankershim who has taken this means as one way of adding only the best animals to be obtained to his big breeding herd.

About seven years ago Mr. Hartsook began to assemble his herd which today numbers over 300 head of females of the finest type and individuality. Numerous private purchases of cows, together with his acquisitions at public auction, have given him what experts and old time breeders declare is the greatest herd of Holstein cows in the world.

Among the great cows he has bought are many individuals known wherever Holstein literature circulates, for show ring winnings and high production. Such cows as Sundrie Sunbeam Girle with a record of 1031 pounds butter in a year from 28,848 pounds milk after dropping triplet calves, and known as the greatest producing and reproducing cow of the big herd at the Santa Anita Rancho, is one of the tops. Edenwold Elizabeth Colantha who made 1064.7 pounds butter from 23,177.3 pounds milk; Pauline Ophelia with a record of 1026.3 pounds butter, both tops of the Toyon Farm herd; Lily McKinley Ormsby Skylark, the undefeated senior yearling of the California show circuit in 1920; and May Altoana Pontiac, a show cow and the producer of 1106 pounds butter in a year, are typical of the kind of cows Mr. Hartsook has bought.

Sir Aaggie DeKol Mead, Senior Herd Sire of Meadhart Herd

Individuality and not high records has been his guide in making his purchases, and cows of the proper conformation which give promise of high production interest him fully as much as the ones which have accomplished great deeds. Under the care of Earl J. Sturgis, who is one of the best known Holstein men in the West and manager of the Hartsook ranch, these good individuals seldom fail to achieve high production in both short and long time tests. This herd has disproven time and time again the fallacy of the idea held by some breeders that great individuality and high production do not go together. In the herd 38 cows average over 30 pounds butter in seven days, 11 average over 35 pounds and two have over 40 pounds. There are nine cows in the herd which have made records of from 1026.3 to 1129.21 pounds butter in a year. In the Los Angeles County cow testing association for the year 1920-21 the herd won five cups, including the sweepstakes cup for biggest winner. For 1921-22 in the contest just closed it will repeat with possibly some additions. It won over a half of the money offered in the Holstein division of the recently completed state dairy cow competition and stood eighth for the United States in the prize money won in the Holstein-Friesian Association of America last year. This last is an excellent showing as it was the first year the Hartsook ranch had done extensive testing, while many of the contestants have been at the game for 30 or even 50 years.

The pride of the Meadhart herd is the great heifer, Miss Aaggie Ormsby Segis, who was raised on the place. As a senior two year old she broke the world's milk record for 10 months by producing 22,083.3 pounds milk. A year later she made two world's records by producing 40.953 pounds butter in seven days and 157.11 pounds in 30 days, displacing Pabst Korndyke Kornflower who stood at the top for over three years and who sold for $30,000.

Another world's record cow in the herd is Rosamaines Korndyke Beauty who in 305 days as a senior yearling made 22,604 pounds milk. As there is no class for yearlings and as she exceeded the record of the highest junior two year old she stands first in that division.

One of the best known cows of the herd is Norma Korndyke Cornucopia who has recently completed a seven day record of 42.81 pounds butter from 885.2 pounds milk, which is one of the highest records made in years. This cow had a previous record of 38 pounds in seven days and 155 pounds in 30 days.

While the short time records are not being neglected the greatest efforts are being put forward in making 305 day records as they are considered the nearest approach to the normal lactation period of the dairy cow and do not interfere with reproduction. A number of very high records in this class are to be announced before long.

As a fit mate for these great cows Mr. Hartsook purchased Sir Aaggie DeKol Mead from A. W. Morris and Sons of Woodland, the premier breeders of Holsteins in this state and country and is furthering the work of line breeding which has given the Morris herd such good results and such great prominence.

Sir Aaggie DeKol Mead is sired by the well known Sir Aaggie De Kol Acme and is out of Miss Valley Mead De Kol Walker who has three times made over 1000 pounds butter in periods ranging from 305 to 365 days. She holds two or three state championships and a couple of world's records. She is also the dam of the $12,000 bull, King Korndyke Pontiac 20th, who has produced a number of high record daughters. The five nearest dams of the Hartsook bull average 1138 pounds butter for the year and number among them some of the greatest cows in the world.

The Meadhart herd is raising its own junior herd sire in a calf out of a heifer daughter of Sir Aaggie De Kol

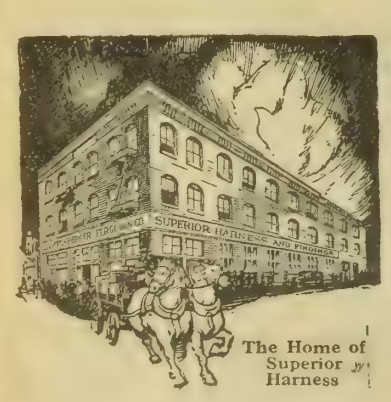
# horse profits

No. 5 of a Series — Published Monthly in the Interests of Better Horses and Better Harness — Louis Lichtenberger, Editor

# TEAMS WORK AT THEIR BEST WHEN THEIR HARNESS FITS RIGHT

Poorly-fitting harness will cause sores and fretting and reduce the efficiency of a team. To get the most work out of your horses see that each wears harness adjusted thruout with "custom fit." Interchanging harness is hard on both the horse and harness.

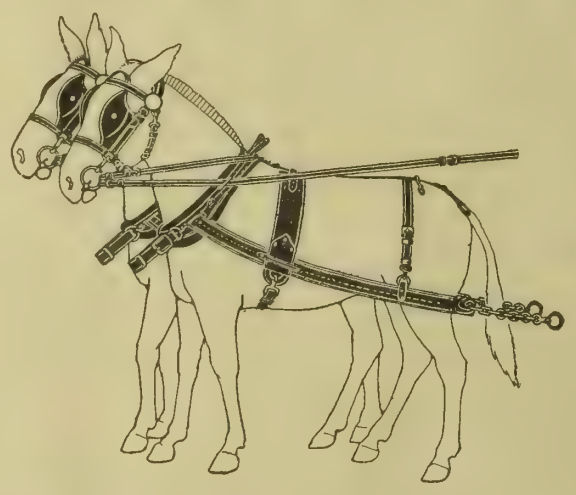
If you are in doubt as to the fitting qualities of the harness you are using take it to a reliable harness dealer. Have him adjust it. And while you're there ask him to show you Superior Brand Harness. You'll be interested in inspecting this high quality product. Note the fine texture of the leather, its pliability and tremendous strength. Observe closely the insulated wax cord used in sewing. You'll be a booster for Superior Brand — and so will your horses.



The Home of Superior Harness

## California Ranchers Cannot Afford to Buy Cheap Harness

With approximately 275 horse working days in California per year as against less than half that number in eastern states, harness receives the severest wear in this State. Superior Brand Harness is built with ample reserve strength to actually outlast eastern-used harness. Its initial cost may be a little more but it's cheapest in the end.



## Style 369---Butt Chain Harness

We have found this to be the most dependable type for mules. Complete specifications and price upon request. Ask any dealer handling Superior Brand or communicate with us.

When Writing Advertisers Please Mention Cultivator.

Mead and sired by the $41,000 Baldwin bull. This calf is a cracking individual and should do well on the fair circuit this fall. His worth in money it is impossibe to estimate. His 15 nearest dams, including the 19.8 pound record of his junior two year old dam, average 31.16 pounds in seven days and his 14 dams exclusive of his own dam who is only part way on her year, average 1104.5 pounds butter in 365 days. There is no bull living which in any way approaches the records behind this calf. Mr. Hartsook also has a heifer calf out of a 100 per cent blood sister to his dam and also sired by the Baldwin bull which has approximately the same array of records behind her.

Many men work all through life with an idea of laying up a great fortune to leave behind them, but Fred Hartsook has a different idea. He will be best pleased if his monument be a strain of Holsteins bearing the Meadhart prefix which will be a credit to the breed both in individuality and production, and it is to this end that he is working.

### SMITH GUERNSEY SALE

The sale of Guernseys from the L. D. Smith herd at Hydesville, which was held at Riverside on August 4, turned out much better than any one who knew the stock predicted. This herd has never done any advanced registry work and few of the pedigrees carried the names of well known animals nearer than the third generation. The cows were in poor flesh but gave signs of being very good milkers if fed up and cared for properly. A considerable portion of the offering was made up of young heifers and calves. Most of the animals were purchased by dairymen who realize the advantage of having a few Guernseys in their herd to give the milk color and high test. Quite a large crowd was present when Chaarles R. Thomas, the sales manager of the Pacific Pure Bred Sales Company, introduced the auctioneer, Col. George A. Gue of Seattle, who had never before cried a sale in Southern California.

A total of 50 head brought an even $8,000 and the 46 females, of all sizes and ages, averaged $166.85. C. W. Main of Riverside, F. L. Cutler of San Diego, E. D. Rowe of Santa Barbara, W. H. Rapson of Corona, Howard Farnsworth of El Centro and Antone Barchard of Santa Ana, were the principal buyers and took a number each. Two cows sold for more than $300; one to A. O. Dinsmoor of El Monte for $355 and the other to Walter Helm of Oxnard for $325. The other mature cows sold generally for $200 or over.

### ARIZONA CATTLE AND SHEEP MEN GET TOGETHER

What is characterized by stockmen as the important step in years to consolidate the efforts of Arizona wool and cattle growers for improvement of the livestock industry in the state, was taken when the Arizona Wool Growers and Cattle Growers Associations in annual convention at Prescott adopted joint resolutions providing for committees of five members from each association to be known as the board of directors of the two associations. This board will have full authority upon questions of mutual interest to both associations "to the end that through cooperation problems of both associations may be solved," says the resolution in part.

At a separate meeting of the Arizona wool growers all officers were re-elected, including President Hugh E. Campbell of Flagstaff.

The cattle growers began organization of a bureau of cattle statistics and appointed a committee to draft a new constitution and bylaws.

### CALIFORNIA NEEDS COW TESTERS

California dairymen want more cow testing associaations but in order to have them more testers are needed. The tester receives good pay, excellent experience and has a splendid opportunity to be of service to the dairymen of the state. Opportunities are now open in Stanislaus, Merced, Tulare and Glenn Counties for capable testers, and other openings are expected. Young men wishing to take up this work should apply to Noel Negley, Extension Specialist in Dairying, Agricultural Hall, Berkeley.

**Throws and Blows**

**a Maximum Amount *of* Ensilage *with a* Minimum *of* Power**

THIS IS ONE MAN'S REASON for buying a Papec Ensilage Cutter. *He said,* "I wanted a machine that would cut and blow a maximum amount of ensilage with a minimum of power."

When asked if his Papec Cutter had proved satisfactory, this man said, "Yes!" He is feeding 30 head of dairy cattle on Indian corn, milo maize and sorghum. When he says he is satisfied with the Papec, it means something.

Agricultural experts say that the Simplex Silo is *"scientifically correct."* The Papec Ensilage Cutter with the Simplex Silo makes a fine outfit for feeding ensilage.

You are invited to investigate these products thoroughly and carefully. Make comparisons. Fill in this coupon and mail it as a first step toward full information.

**Jerseys**

August 28, Dispersal, W. H. Rough herd, Riverside.

---

I. J. Scott of Ponoma who will be superintendent of dairy cattle at the coming Los Angeles County fair has one of the finest herds of grade cows in the South. Three times in the past six months the cow testing association to which he belongs has credited his herd with an average of over 50 pounds fat per cow.

---

Lady Katez's Rosette of R. S. M. 361239 has just qualified for an American Jersey Cattle Club Gold Medal. She started test at 6 years 5 months of age and in 365 days produced 13,919 pounds milk and 741.51 pounds butter fat. Rosette carried calf 204 doys during test and tests 5.33 per cent. Her sire, Pansy's Gertie Lad 104963, has three daughters in the Register of Merit. Victor's Lady Kate 218118 is her dam and has two Register of Merit records averaging 8697 pounds milk and 414.05 pounds butter fat. This cow is owned by D. F. Conant, Modesto.

---

Alex McMinn, the well known Ayrshire breeder who recently moved his herd from Phoenix, Arizona, to Corona, has been making a number of nice sales. George Mercer, president of the Armour Grain Company, who has a ranch near Santa Ana, recently purchased eight head of females which included Lucy of Mountain View, the heifer which was junior champion at the Los Angeles, Riverside and Phoenix fairs in 1920 and repeated at Ventura, San Fernando and Riverside in 1921, as well as the show cow Ellen Dean of Mesa who was grand champion at Riverside in 1921. McMinn is a great lover of Ayrshire cattle and a tip top show man and he intends to have a small but select show herd out again this fall.

---

Walter H. Dupee of Riverside recently purchased a couple of fine Guernsey heifers from Frank Reed Sanders of Phoenix, Arizona. One of the animals was bred by the Hollow-Hill Farm and sold in dam to John Walthal of Scottsdale, Arizona, who raised her. She was sired by Cora's Glen and is therefore a paternal sister to Dene King of Hollow-Hill Farm who topped the recent Edgemoor Farm sale.

---

# A Wonderful Opportunity to Buy Clean Registered Holstein Heifers

Never before in the entire west have so many registered Holstein heifers been offered in one sale, and the offering affords a choice such as comes very rarely.

COMPLETE DISPERSAL

140 — REGISTERED — 140

## HOLSTEIN HEIFERS

WILLOWMEAD HERD, Sacramento, Calif.,

Owned by Jas. McGillivray

**Thursday, August 17, at 9:30 A.M.**

These heifers are from one of the longest established California herds. It will be remembered that a few years ago when Mr. McGillivray was increasing the size of his herd through purchase, he appeared several times as a buyer of $1,000 females, at a time when those were top prices. Only the highest class herd bulls have ever been used, and the heifers in this offering represent a long time of constructive breeding.

KEEP THIS IN MIND!

These heifers have been raised on milk from tuberculin tested cows, turned into clean pastures at weaning time, and in testing for this sale only one reactor out of 175 was found, that one a calf lately brought over from another ranch. And in addition to that every heifer over six months old is sold tuberculin tested and subject to 60 day retest by the buyer.

UNIFORM BREEDING

The entire 140 head in the offering are sired by just eight bulls, permitting a selection of uniform breeding. Of these approximately 100 are sired by just four bulls, Colony Zarilda Newman, whose dam has twice made over 1,000 lbs. butter and over 30,000 lbs. milk in one year; Prince Echo Sylvia Segis, sired by the greatest proven son of May Echo Sylvia; Yolo Valdessa Hengerveld, a 30 lb. son of the 41 lb. bull King Valdessa; and Yolo Mead Paul, one of the good sons of King Mead of Riverside.

THIS IS THE OPPORTUNITY OF YEARS TO BUY CLEAN HEIFERS OF POPULAR AND HIGH RECORD BREEDING. NONE ARE YET IN MILK, BUT SOME ARE SPRINGERS, ABOUT 100 SELLING OPEN.

**Place of Sale:** On the main highway between Sacramento and Stockton, about 12 miles south of Sacramento. Watch for sign on highway.

**Headquarters of Sale:** Travelers Hotel, Sacramento, from which point transportation will be afforded out of town buyers morning of sale.

## Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

**Skin Diseases**

We have a little fox terrier that is troubled with a skin disease said to be eczema but have found no treatment that gives permanent relief. Have used one part kerosene to two parts olive oil which relieves temporarily but seems to drive it to the ears. The eruption is confined mostly to the back near the tail. The trouble seems to be worse in summer. He is a household pet and kept ordinarily clean. Can you suggest a remedy?—Subscriber, San Gabriel.

The fox terrier is subject to the skin disease you have described. It seems to be due to rich feed. They are good feeders and those that get much meat and sweets soon develop the skin trouble. It is hard to cure. Feed no candy nor cakes and only raw meat and very little of that. Give milk and dry biscuits made of corn meal, oat meal and flour made with sour milk with a little salt and soda. Bathe the parts with a solution of washing soda.

---

**Fails to Breed**

After two calves our cow fails to breed again. Have bred her four times and used three different bulls but with no results. A stockman noticed a whitish discharge from her shortly after breeding and recommended douches with soda in it. If this is good how much soda should be used and how often should the douche be given?—Subscriber, San Dimas.

First have her tested for tuberculosis. The douche suggested will do very little good unless injected into the womb, and only a veterinarian could do that. You might try an ounce of the tincture of iron in the feed once a day.

---

**Easy Feeders**

Is a small or short head in hogs and cattle a sign of an easy feeder that will give more returns from the feed?—Subscriber, Brawley.

A pug nose or short faced animal is easier to fatten and to keep fat. The long nosed animal usually has a long back also and requires much more feed for fattening. Occasionally in crossing animals you might get one

ADMINISTRATRIX SALE

with a short head and a long body; that also is not desirable. Breed only pure breds and breed for the type you want.

### Boar Retaining Urine

Is it a bad fault for a boar to keep a lump of urine under the belly, that is when it does not all drain out? A friend tells me it should be presssed out occasionally.—Subscriber, Brawley.

It is a fault and should be relieved occasionally as the friend suggests. There is no remedy for it.

### TULARE COUNTY FAIR AT TULARE, SEPTEMBER 13-19

Secretary Charles L. Kennedy of the fair committee calls attention to an error in news item appearing in the Cultivator of July 29 wherein it was stated that the Tulare County fair would be held at Visalia, September 12-19. The fact is, Secretary Kennedy writes, that the fair is to be held at Tulare and from September 13-19.

# Poultry Queries

Conducted by Jean A. Koethen

### Blackhead

When I cut my young turkeys open I find their livers spotted and swollen. Is there a remedy?—Subscriber, Shafter.

You might try the ipecac treatment recommended by the Drs. Wegeforth of San Diego. Some turkey growers are finding the powdered ipecac, given in the food twice a week, a teaspoon of the powder to each unit of 20 turkeys, keeps their young turkeys from getting blackhead. For the birds that are already sick fluid extract of ipecac is recommended, 10 drops being given through the mouth three times a day for three days, then twice a day for three days, and finally once a day for three days. I hope some reader of the Cultivator will try the turpentine and ginger method of prevention which was sent us last year by a subscriber. To a pint of bran and a pint of breadcrumbs is added enough boiling water to make a crumbly mash. When this is nearly cool add one quart chopped greens, one small chopped onion and one cup chick grit or sand. To this mixture is added for each ten turkeys three drops of turpentine and one-fourth teaspoon ginger. This is fed twice a week in place of the regular mash, and twice a day for three days if white spots are noticed on the back of the legs.

### Cholera

I would like to know a remedy for cholera.—Subscriber, Shafter.

Dr. Beach said a couple of years ago at the poultry school that the most satisfactory remedy he had found for cholera was a thorough cleaning up. A bichloride of mercury tablet in the drinking water helps to prevent infection of other birds. All sick birds should be killed and the carcases burned or buried deep.

### To Retard Laying

My four and one-half months old pullets are making comb rapidly and some have commenced to lay. They have free access to a wheat stack and have a dry mash which is half commercial laying mash and half bran before them constantly. At 9 o'clock I feed six pounds mash moistened with sour milk into which cut barley is mixed. At 4 o'clock I feed six pounds sprouted barley and six pounds cracked corn. Since they have been laying I have added one-fifth corn meal to the mash. How shall I retard their laying? Would half ripe grapes have a retarding effect without doing any harm. I have 275 R. I. Reds.—Subscriber, Lancaster.

I am afraid you cannot feed much corn or corn meal in your climate in summer. Better talk with some old timer about it. If you wish to keep your pullets from laying till they are six months old you will have to feed more grain and less mash. Prof. Dougherty recommends for this purpose a maintenance mash of bran alone, with about 5 per cent bone meal added. As you have considerable sour milk you will hardly need the bone meal. You might keep plain bran before the birds, moistening it once a day with sour milk, and give barley at 4 o'clock, in addition to the wheat from the stack. Hard grain has been called the balance wheel of a hen's ration. If you wish to put fat on her bones and retard laying, feed more grain and less mash. When you want her to put all her energy into making eggs cut down the grain and give a good rich laying mash. Do not feed too many grapes. A few are all right, but the birds need grain if they are to develop properly.

### Overcome by Heat?

How can I stop my chickens' dying? They lose the use of their legs and die in from two to ten hours. They have good appetites, even when they cannot walk. They get very red around the eyes and the eyes draw down. They were hatched this spring.—Subscriber, Marwell.

From the data given I cannot say with certainty, but it looks to me as if those young chickens were dying from heat prostration. Have they abundant shade, fresh water always before them, green feed and a cool comfortable place to roost? These things are vital in hot weather. If you are feeding rice use it with other grains. One grain alone is never good, especially one containing as much starch as rice.

### 95 Per Cent Pullets

Can you tell me where I can get White Leghorn chicks that are guaranteed to be 95 per cent pullets?—Subscriber, Laws.

I know of no one who makes such a guarantee. If any one can furnish such information it will be appreciated.

### Sick Turkeys

When my turkeys are half grown they die off one by one. Post mortem shows liver covered with hard yellow spots.—Subscriber, Arroyo Grande.

Please note reply to Shafter subscriber. It is the same disease that kills nearly all the young turkeys that drop off before three months of age. Treatment is not very satisfactory, though the ipecac treatment is saving some. The trouble has its origin generally in improper feeding, more particularly in overfeeding, and can only be prevented by the most rigorous care.

### Pendulous Crop

The crops of two of my turkeys hang almost to the ground. What is the cause and remedy? How are your turkeys? Are they all living? I try to follow your instructions in feeding, but it seems I can't hit on the right plan. I think it is hard to get rid of the vermin, and I have tried every known remedy.—Subscriber, Glendora.

My turkeys are doing very well, thank you. They did not all live, but I have seven out of 13 hatched, and they are well past the critical period. I feel certain the method of feeding I follow in common with many other turkey fans is right, the only thing is, to avoid overfeeding. Watch as you may, it is impossible always to feed exactly enough and not too much. Grit and green feed are an essential part of every meal with little turkeys, and chopped hard boiled egg, when mixed with cereal and greens, and in limited quantity, is a standard feed which is giving general satisfaction. For the cereal part of the ration I consider rolled oats the one best feed. Bread and wheat flakes may be better at the start, but as the turkeys grow and develop they do very well on rolled oats and chopped onion alone. My older bunch, hatched the middle of April, is now eating bran and barley with the chickens, but "goes wild" over the well remembered bowl of rolled oats and onion. I have been fortunate this summer in having a great deal of sour goat's milk for my turkeys. There is nothing better.

For pendulous crop in turkeys, the best remedy is a firm bandage. There is an operation, the cutting out of a piece of the skin, but only an expert should try it. The cause of pendulous crop is overstuffng when the birds are young and the membranes easily stretched.

If you will buy a little can of buhach powder and dust the hen thoroughly twice during incubation, then dust her and the poults within a week after hatching, and every week thereafter you will not be troubled with lice. For mites the only preventive and cure is spraying or painting the coop with an insecticide, such as cresol, carbolineum or crude carbolic acid and kerosene.

## WHEAT MARKET PROSPECTS

The American Farm Bureau's news letter of July 20 contains a very interesting article on wheat market prospects for 1922, from a survey made by the department of research.

This report shows a carryover in the United States of 67,983,000 bushels, which is some 7,000,000 bushels below the average carryover. The estimated amount available for export from the United States, Canada, Australia, Argentine and India is 635,000,000 bushels, or about 57,000,000 bushels less than the total exported in 1921. Based on a normal increase the export demand for this year should be 725,000,000 bushels, this provided of course that the importing countries are able to buy what they need.

The crop in the United States for 1922 is estimated at 817,000,000 bushels which, with the carryover, makes a total available supply of 885,000,000 bushels, compared with 887,000,000 for 1921.

The report states that the shortage in the world's supply is due to decreased wheat acreage and poorer condition of the central and western European crop, which indicates a yield of 120,000,000 bushels less than last year.

Summing up the situation, the report states that buying should be strong during the remainder of the summer and fall and the indications are for a strong demand during the first half of 1923.

## AGRICULTURAL TARIFF SCHEDULES

The senate has completed consideration of the agricultural schedules of the tariff bill. Some of the more important rates are:

Wheat 30 cents bushel of 60 pounds; corn, 20 cents bushel; beans, green or unripe, ½ cent a pound; dried, 2 cents; a pound; potatoes, 58 cents per hundred pounds; peaches, ½ cent a pound; grapes, 25 cents per cubic foot; butter, 8 cents a pound; milk, 2½ cents a gallon, and cream, 22¼ cents a gallon.

The poultry people lost their fight to increase rates on dried and frozen eggs from 18 and 6 cents respectively as reported by the committee to 24 and 8 cents a pound. A special effort to increase rates on soy beans was defeated, and the committee rate sustained. Finally the senate returned to the vegetable oil schedule passed over without action some weeks ago and passed the rates on competing vegetable oils asked for, three cents on coconut and soy bean oils and 4 cents on peanut and cottonseed oils, but immediately thereafter by a vote of 24 to 33 refused to take out of the bill the proviso which if permitted to stand in the final action on the bill will admit these oils free of duty if they are to be used for non-edible purposes. Cotton and wool schedules are to be taken up next.

## FARM BUREAU MOTION PICTURES

Arrangements are being made for showing the first of a series of motion pictures by the farm bureau in this state. "Spring Valley" is the title of this particular play, especially gotten out to explain to non-members the benefits of joining the farm bureau. Arrangements to secure the film may be made with Grant W. Kenney, American Farm Bureau Federation Motion Pictures, 105 Montgomery St., San Francisco.

There's only one Caterpillar Holt builds it

Here is the new high point of achievement in small tractors—"Caterpillar" T35 Tractor—big in power, enduring in service and versatile in performance. Weighing only 4000 pounds and measuring only 48 inches in width, it carries a 25 h.p. motor and delivers 15 h.p. at the drawbar. This has been accomplished by advanced design and improved qualities of steel and methods of heat-treatment. "Caterpillar" T35 Tractor establishes a new standard for dependability and long life.

Get full information and ask where you can see the T35 on display or in operation. Or ask about larger size "Caterpillar" Tractors—the 5-Ton, Western 10-Ton or big-power 75.

### BEANS

F. o. b. Cal.:

| | |
|---|---|
| Lima, Standard | 8.50@8.75 |
| Lima, Henderson Bush | 8.50@8.75 |

Cal. Lima Bean Growers Assoc. reports some sales made in June for Oct. delivery of 1922 Limas and Baby Limas at around $6.25@6.40 f. o. b. Coast. Demand for futures now quiet. Assoc. has been sold out of 1921 crop for some time.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 18.00@23.00 |
| Barley | 16.00@20.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 16.00@20.00 |
| No. 1 Alfalfa | 15.00@17.00 |
| Standard Alfalfa | 11.00@13.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@20.00 |
| No. 1 Dairy | 14.00@15.00 |
| No. 1 Alfalfa | 12.00 |
| Wheat Straw | 6.00@8.00 |
| Barley Straw | 4.00@6.00 |

### GRAIN

Prices L. A. Grain Exchange, August 8:
Barley: 100 ton lots August Del. 1.27½.

Grain Department California Farm Bureau Exchange:

Los Angeles, August 7.—Wheat: Heavy arrivals have somewhat weakened the market in Los Angeles and have filled all available buyers so that there is an easier tendency and prices have gone off from 5+ to 2½+ according to the grade. With continued weakness in the Chicago market, the future California market is entirely a matter of whether the farmers let loose at current prices or hold in hopes of later advances.

The fundamental position of wheat is rather strong and when the heavy run of wheat being harvested in the middle west has been taken care of, it is quite likely values will stiffen, especially if an export demand develops. Considerable California wheat has already been exported. This has held the price firm. At the present time there is no apparent further export demand and it is presumed that export orders can be taken care of now at lower prices than California can offer. Idaho wheat based on current eastern quotations should be available for California terminal markets in two or three weeks time at considerable less than present California values.

Barley: Barley has not come in so freely but the market has declined a full 5+ to 7½+ cents under last week's quotations. The best price obtainable today would be around $1.22½ to $1.23¾ for top grades of feed barley. Poorer grades would have to be sold correspondingly low.

Oats: Fancy Texas oats are offered now at from $2.00 to $2.15 delivered, California terminals. Eastern white feed oats can be bought at from $1.60 to $1.65 bulk, California terminals. California oats are bringing very high prices comparatively. We cannot quote a firm price in this market but San Francisco has been absorbing California oats at very high prices through the Exchange which has been able to obtain much higher prices than outside dealers. Los Angeles doesn't seem to be, at the moment, absorbing any California oats at anything like San Francisco prices.

Millfeeds: Some eastern white bran is offered about $2.00 decline. Red bran is about steady. Carload values are around $28.00 for Kansas red; $38.00 for Inter-Mountain white and blended.

**Figs, 1922, Cal. Peach and Fig Growers Assoc. prices:**

Opening quotations for the 1922 crop of figs released July 24 by the San Francisco representative of the California Peach and Fig Growers' Association, show substantial advances, particularly in black Missions. This grade is quoted at 11¼ cents this year, as against an opening price of 5 cents a pound in 1921.
The complete price list for 1922 crop Blue Ribbon, dried figs follows:
Adriatic—Price 6¼; standard, 6¾; choice, 8¾; fancy, 11¾.
Calimyrna—Standard, 8¾; choice 11¾; fancy, 14¾.
Black Mission—Standard, 11¼; choice, 14¼, fancy, 17¼.
These prices are for figs packed in twenty-five pound boxes, ¼c per pound less for packing in fifty-pound boxes.
Adriatics, ungraded, in bags....7¼c per lb.
Adriatic fig paste, 75-lb. boxes 5½c per lb.
12-10 oz., bricks, Adriatics....$1.10 per box
24- 8 oz. bricks, Adriatics.... 1.75 per box
50- 6 oz. bricks, Adriatics ..... 2.80 per box
70-d oz. bricks Adriatics.... 2.95 per box
24- 8 oz. bricks, Calimyrnas.. 2.25 per box
For foil wrap or brick figs add 10c per box.

| Box | Row | Inches Spread | |
|---|---|---|---|
| 10-lb. | 4 layer Adriatic | 2½ | $1.60 |

**Raisins, Sun-Maid Raisin Growers' Prices:**

Raisin growers may expect to receive 5¾ cents for standard muscats, 6½ cents for standard Thompsons and 6 cents for Sultanas, sweat box basis for the 1922 crop, according to a statement given out July 31 by the Sun-Maid Raisin Growers in connection with the announcement of new prices on the holdover of raisins from the 1921 crop.
Prices on the new crop will not be officially given to the public until August 15, but in a statement made by General Manager F. A. Seymour the trade is officially assured that new prices will be at least one-half cent higher than those named on the old crop, and the general manager is authority for the prices which the growers may expect under this schedule. The prices to be named on August 15 are on a crop basis of 225,000 tons, according to Seymour.
According to the general manager, 35,000 tons of 1921 crop raisins remain to be marketed at the new prices.
The revised prices on the 1921 crop named August 1 are:

| | Revised Price |
|---|---|
| Bulk Thompsons | 9½ |
| Carton Thompsons | 10 |
| Blk. Seeded Muscats | 9 |
| Fancy seeded pkgs | 10¾ |
| 1 cr. loose Muscats | 8½ |
| 2 cr. loose | 9 |
| 3 cr. loose | 9½ |
| Bakers. Thompsons | 7½ |
| Sultanas | 8½ |
| Seeded Malagas | 8½ |

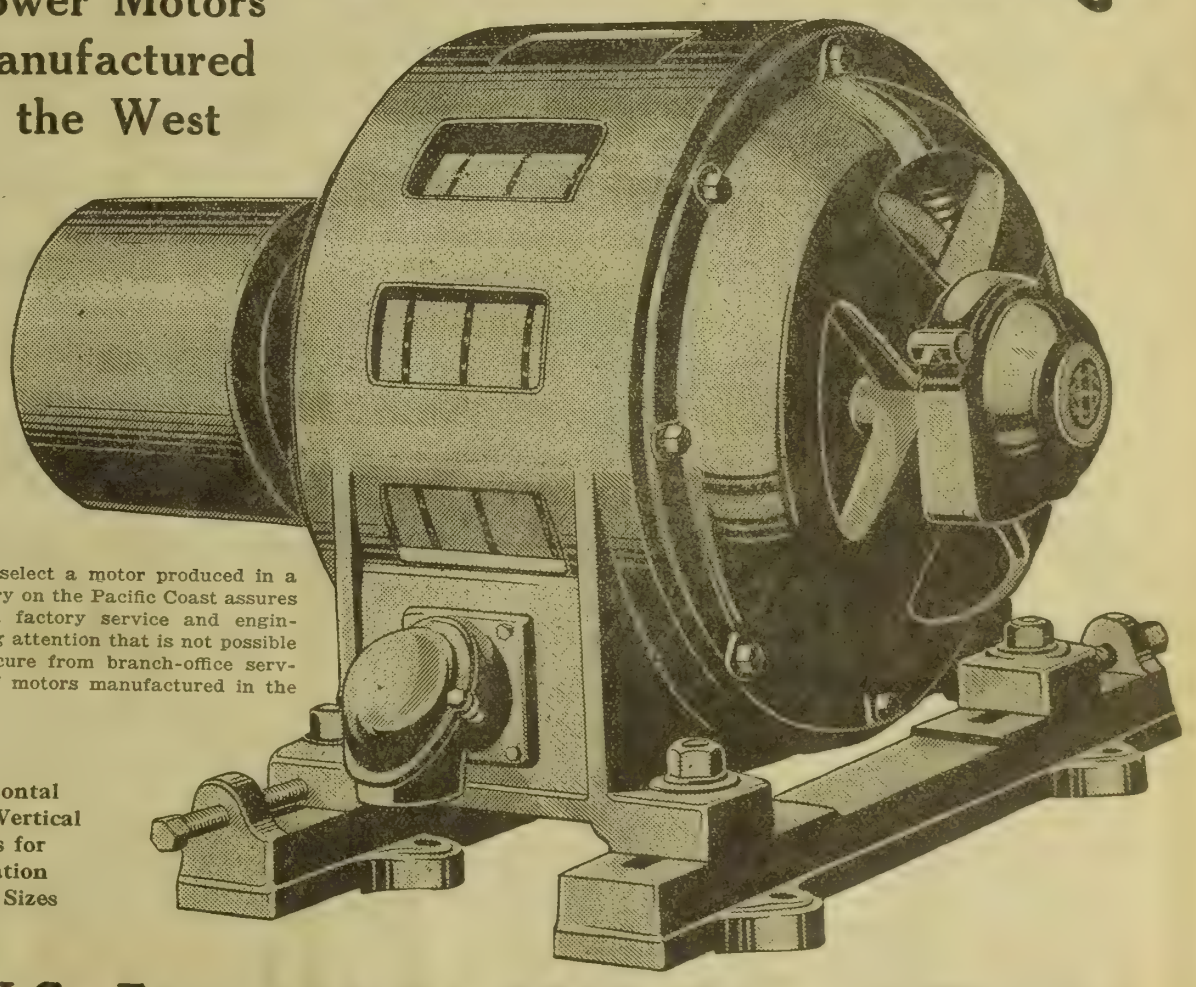
The Only Power Motors Manufactured in the West

U. S. MOTORS



To select a motor produced in a factory on the Pacific Coast assures direct factory service and engineering attention that is not possible to secure from branch-office service of motors manufactured in the East.

Horizontal and Vertical Types for Irrigation —All Sizes

U. S. ELECTRICAL MFG. CO.
Largest motor builders in the west since 1906
LOS ANGELES
Branch Office and Warehouse at Stockton

U. S. Motors have been accepted by leading Irrigation Companies and Ranchers because of our product's unfailing stamina and power performance. With effortless ease these motors deliver their full volume of power, operating unceasingly without over-heating.

2400 telephone wires in a cable little larger than a man's wrist.

## Science keeps down costs

When the Bell System installed its first successful telephone cable, fifty wires was the largest number that could be operated in a single cable without "cross-talk" and other interference. Today it would require 48 cables of the original type to accommodate the number of wires often operated in one cable.

Without this improvement in cable, the construction of new underground and aerial lines would have cost the Bell System upwards of a hundred million dollars more than has actually been spent. In addition, the cost of maintenance would have been greater by eighteen million dollars a year. These economies in the Bell System mean a saving in telephone rates to each individual subscriber.

In all branches of telephone practice science has similarly contributed to economy. Even in such a comparatively small item as switchboard cords, improvements have reduced the cost of renewal by four million dollars a year.

Every new telephone added to the Bell System increases the usefulness of *all* telephones, but this multiplication tends likewise to increase the complications and the expense of service. The scientists of the Bell System, to offset this tendency, are constantly called upon to develop new devices which simplify complications and keep down costs.

By virtue of a united system the benefits of these improvements are shared by all subscribers—and the nation is provided with the best and cheapest telephone service in the world.

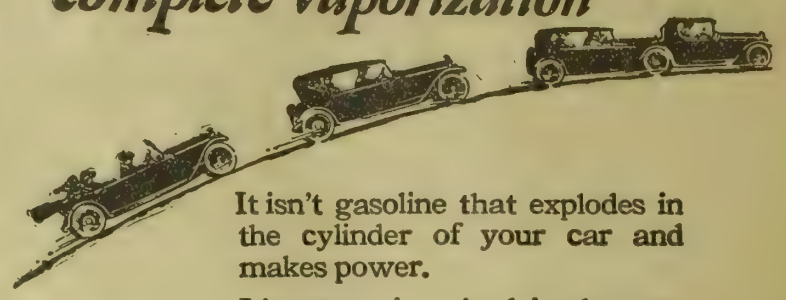
# More mileage—
## the result of *complete vaporization*



It isn't gasoline that explodes in the cylinder of your car and makes power.

It's gas—air, mixed in the carburetor with gasoline to form vapor.

Red Crown gasoline *vaporizes completely*. It forms a homogeneous mixture with 12 to 16 times its volume of air. That mixture explodes cleanly and powerfully, leaving comparatively little carbon residue on valves, spark plugs and cylinder walls.

That's why you get better mileage out of "Red Crown"—and a cleaner, sweeter-running engine.

Fill at the Red Crown sign—at Standard Oil Service Stations, at garages and at other dealers.

STANDARD OIL COMPANY
(California)

## *Keeps Small Tractors on the GROUND-*

Every light tractor with its powerful engine is likely to climb over backwards and kill or seriously injure the man at the wheel when the plow strikes an obstacle.

Five minutes installs a Westgate Ground Holder which may save you five months in the hospital, or worse.

Keep your Tractor on the ground. An accident means doctor bills, repair bills, and delays your work just when delay may be costly.

As soon as the front wheels of your Tractor start to rise, the Westgate stops your motor. It is fool proof, has only two moving parts and is guaranteed not to get out of order for the life of your Tractor. Cost only $10 complete.

# Never Before So Much Plant Food For So Little Money

## Facts Backed by Actual Field Tests and Confirmed by Scientific Research Prove Phosphoric Marine Shell Lime Worth Many Times Its Low Cost

IF you do your own thinking and use your own eyes you will be interested in the proof positive statements that follow:

We can show you orange groves within two hours ride of our Phosphoric Marine Shell Deposits that show an increase in yield of from two, three or four boxes of oranges per tree to SEVEN OR MORE boxes per tree because of the application of shell lime.

The owners of these groves will tell you it is their honest opinion that it was the liberal application of this lime that caused the condition making this increased yield possible.

We can show you cover crops where the same beneficial results were obtained in almost the same proportion.

We can show you soil that, before the application of Marine Shell was a hard unworkable, clay adobe and that with the application of this lime (calcium) it has become loose, mellow and rich, with heavy crop growths.

We can supply you with almost no end of scientific data showing why marine shell produces these desired results. No element of plant food has been accorded more painstaking experiments in the various branches of the department of agriculture than calcium—the main ingredient of Phosphoric Marine Shell. Calcium is recognized all over the world of agriculture as ONE of FOUR necessary elements in plant growth. **DO NOT MINIMIZE ITS IMPORTANCE.** Investigate, look and study and you will be convinced that at the exceedingly low price at which you can purchase **Phosphoric Marine Shell** with its calcium oxide, phosphoric acid and other plant foods, and its resultant action in the soil, liberating other elements that are inert without it, you will receive **More For Your Money When Purchasing It Than Any Plant Food You Can Buy.** CALCIUM is a necessary element—you may have it in your soil BUT IT MAY NOT BE AVAILABLE.

Dr. R. R. Snowden and practically every other EMINENT authority on plant foods has published statements and books showing the necessity of calcium to the growth of MOST PLANTS. These include ORANGES, ALFALFA, ASPARAGUS, BEANS, BEETS, CAULIFLOWER, PEAS, MUSKMELONS, PLUMS, BARLEY, WHEAT AND A GREAT LIST OF OTHER IMPORTANT CALIFORNIA CROPS. And those who have made the closest study of Calcium and its relation to plant growth, state that in many areas where it is supposed that calcium is in abundance in the soil—IT IS NOT IN AN AVAILABLE STATE. This is especially true in many California soils. The proof lies in the application of Phosphoric Marine Shell Lime. We can show you groves in land that tested high in calcium that were starving for that very element because the calcium, like much of the nitrogen and potash, were locked up in an inert chemical combination that only plant available calcium could unloose.

The tests in which our shell lime have proven its worth, corroborated by the eminent authorities who have proven conclusively that marl or shell lime is highly beneficial to plant life requiring lime, should convince any fair-minded person of its desirability.

Phosphoric Marine Shell Lime will not, cannot possibly do your crop any harm. It has done immense good on the lands of many others. Have you ever tried any, and if not, WILL YOU TRY some this year if only a sample on ONE TREE OR PLOT?

There is abundant additional proof to indicate the high value of Phosphoric Marine Shell. Send for our free booklet giving additional information as to what Phosphoric Marine Shell Lime will do.

### WHY PHOSPHORIC MARINE SHELL SHOULD BE FED TO THE ORANGE TREE AT FREQUENT INTERVALS

Every orange grower knows that the orange tree is encouraged in California to be a shallow rooted plant—as far as feeding roots are concerned. These roots use up rapidly all foods in the shallow top layer of soil. You recognize that you must replace phosphorus, nitrogen and potash at frequent intervals. How about calcium? The orange is a heavy calcium feeder. Many orchards cease to be good producers after a few years when the calcium is exhausted in the top layer of soil. Remedy the fatal oversight with Phosphoric Marine Shell.

Considering the high calcium content, its phosphoric acid and the resultant release of nitrogen and potash not all available without the action of the calcium, at the low price we are selling it, IT IS THE CHEAPEST FERTILIZER YOU CAN BUY. WILL YOU GIVE US AN OPPORTUNITY TO PROVE OUR STATEMENTS?

Pomona, July 28th, 1922.

TO WHOM IT MAY CONCERN:

This is to certify that I put 7½ ton per acre of Decomposed Marine Shell on my grove the first part of August, 1921.

In conjunction with the barn yard manure, I have the best results ever obtained from the use of any fertilizer, commercial, or otherwise.

I had considerable mottle leaf in my grove, but this condition is almost entirely eliminated. I have about one acre of very hard soil, and it is somewhat lower than the surrounding ground.

After using Marine Shell, this piece of ground is just as friable, and in as good mechanical condition as the rest of the grove. Notwithstanding abnormal conditions existing last winter in the way of cold weather, I have above the average setting of fruit for this season, and it looks fine at the present time. I am entirely satisfied with the results.

(Signed) A. L. CAHOON,
Pomona, Calif.

The Rare Gift of the Sea to the Land

### Pounds of Various Plant Food Elements in One Ton of Phosphoric Marine Shell

| | | |
|---|---|---|
| Phosphoric Anhydride ($P_2O_5$) | 30 | pounds |
| Lime (CaO) | 800 | " |
| Magnesia (MgO) | 52 | " |

| Sulphur ($SO_3$) | 3 | " |
| Iron Oxide ($Fe_2O_3$) | 18 | " |

**We sell Phosphoric Marine Shell based on the above composite samples taken from over 40 test pits.**

The mine of the Phosphoric Marine Shell Company is located within a short distance of San Pedro Harbor in the Palos Verdes Hills. Our product is an Organic Calcium, once digested in a living creature,—once in solution in the body juices and later deposited in shell or bone. **No crystalline mechanically ground Calcium is its equal for rapid and complete action.** Tests on our materials show that a very high percentage passes through a 200 mesh screen.

Our company is a producing and selling organization with absolutely no connections with any other lime company or selling agency. Car lot shipments or smaller quantities are sold by ourselves and through our dealers.

Based on a composite analysis of extensive sampling over some 45 test pits we offer Phosphoric Marine Shell Lime averaging 40% calcium oxide and 1½% phosphoric acid, $4.00 per ton at bins or $4.75 per ton f. o. b. cars, Wilmington Spur, San Pedro.

We can also deliver this on board ship at San Pedro, and are able to obtain very low water rates to San Francisco Bay points. This Marine shell is especially valuable as a soil amendment for the land surrounding San Francisco Bay.

Agents and Dealers are desired in unoccupied territory.

# Prune Drying

By L. C. Barnard

PRUNES are plums which can be cured without the removal of the pit without fermenting and are of the European type. The varieties most used for curing in California are French, Sugar and Imperial. The following European plums are also dried to a certain extent: Silver prune, Italian prune, Robe de Sargent, Coates, Splendor, Standard, Golden prune, German Prune and the Tragedy.

Prunes which fall naturally from the tree contain the most sugar, dry heavier and give the best quality product. Therefore it is advisable to allow them to hang on as long as possible. Most growers go over their trees three or four times during the season. The first two or three pickings take place after sufficient fruit has fallen to the ground, at intervals of from one to two weeks, depending on the climate. The orchard soil under the trees should be perfectly clean and smooth to facilitate rapid and clean picking. Sometimes the tree is shaken lightly following the first picking. However, most of the growers confine their shaking to the third or fourth picking when the trees are stripped. Prunes which are not fully ripened are very noticeable during the dipping and drying process from their red color, also from the slowness with which they dry.

Crude but Effective
Home-made Prune Dipper

### Dipping Process

After harvesting prunes they are put in a wire basket and dipped in a solution of lye and hot water. The amount of lye used and the temperature of the solution varies considerably with different growers. However, the solution should be kept as near boiling as possible and the standard dip is four pounds of lye to 1000 gallons of water, good for about 400 boxes, providing care is observed to drain fruit well before dumping out of basket.

Sometimes when the solution is too hot and the prunes are dipped too long a depth of 1/32 of an inch just under the skin is cooked to a dark brown. This portion becomes jellied or partially solidified and during the drying process the moisture from the fruit does not evaporate properly, hence bloaters and chocolates occur. Members of the division of pomology of the state university have experimented with the following temperatures: 160, 175, 190 degree Fahrenheit, and boiling. A boiling solution gave the best results. The length of time the prunes are left in the solution is best learned by experience. The object of dipping is to remove the bloom and check the surface of the fruit sufficiently to facilitate rapid and proper drying. Fruit which is improperly checked makes many bloaters, therefore the person dipping should watch the fruit and see that the dip is long enough to secure proper checking. The prunes should not be dipped so long that large cracks appear, or until the skin sloughs off, as this makes a poorer quality dried fruit. The average dip is from 15 to 20 seconds, but varies with the condition, variety, whether grown on heavy or light soil, temperature and strength of solution, and condition of the fruit. The greener prunes tend to check easier than ripe ones. The hotter and stronger the solution the quicker the checking.

Prunes from heavy soils have tougher skins. The toughness of the skin of French, Sugar and Imperial prunes ranks in the order named. In fact, Imperials are so tender that a weaker solution is used and some growers spread the fruit on trays in the sun for three or four days before dipping them.

### Rinsing

After the prunes are removed from the dipping solution they are sometimes rinsed with cold water. This custom, however, was not practiced by the majority of growers during the 1921 season.

### Needle Board

The dipped fruit is allowed to pass over a shaking needle board which pricks the fruit in numerous places, facilitating drying, especially with under checked prunes. This practice, however, is only used by about half of the growers, probably due to the fact that the needle board often becomes covered with leaves and dirt, so that the pricking is not effective. However, experiments have been carried on to note the results of the use of a pricking board and seem convincing that its use gives the best quality of dried prune.

### Graders

After passing over the pricking board the prunes pass on over the grading screens. The screens are agitated while the prunes pass over them. The average number of grades handled by the majority of graders are three, No. 1, No. 2 and No. 3, or "pie" grade. Some dippers, however, are fitted up with screens to separate a larger number of grades. The No. 2 and 3 grades dry the fastest, owing to their smaller size and the fact that a good many of them are shriveled considerably already. Therefore the different grades should be dried separately to obtain best results.

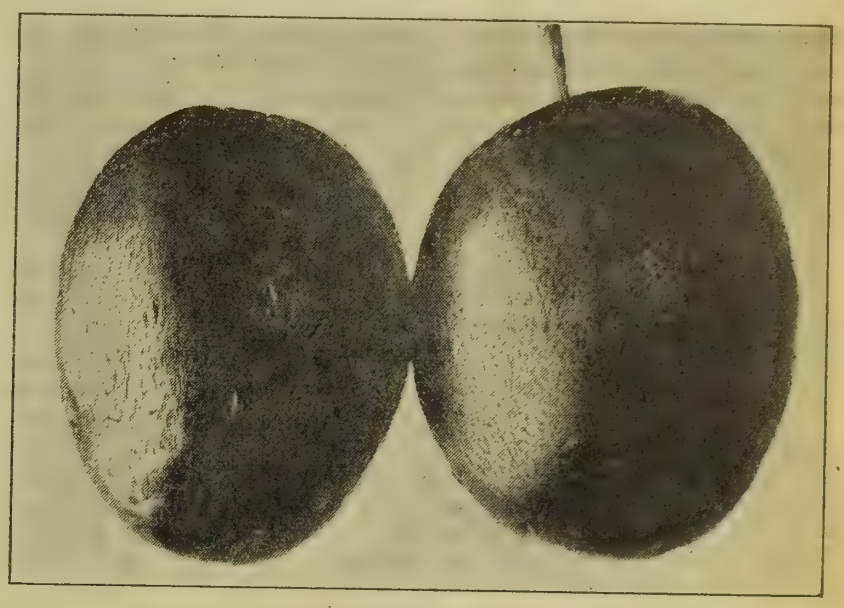
The type of dippers used can be the manufactured type or the ordinary home made affairs. Home made dippers can be of almost any type desired, as long as the fruit is treated in the proper manner.

### Lye

Some of the following brands of lye are used in the dipping process, and can be bought in one pound cans or in larger bulk quantities, being cheaper in the bulk: Babbits Concentrated, Red Seal Granulated, Banner High Test Pulverized, American Granulated Lye, Acme High Test Granulated Lye and Hercules Caustic Soda.

### Curing or Drying Process

As the fruit rolls from the grader onto the trays the prunes should be evenly spread over the trays, one layer deep. The trays are then placed on the tray car. After a sufficient number is on the car it is pushed to the drying yard. Here the trays are spread in the sun the same as for apricots. However, the different grades are kept separate. Sometimes during the drying process some growers rake over the trays with wooden rakes and separate the bloaters and chocolates while others do no culling or sorting until they are taken from the stacks. Prunes are exposed to the sun from five to ten days, depending on climatic conditions and the condition of the fruit. As a rule, when they are about three-fourths dry they are stacked similar to apricots. The fruit remains in the stack from one to four weeks, depending on climatic conditions.



Properly Checked Sugar Prune
Dipped in boiling lye solution for 15 seconds

### Indications that Curing is Complete

Well cured prunes should be leathery to the touch, flexible and fairly firm. If the prunes can be made to rattle on the tray they are too dry. The flesh of the dried prune should be amber colored and not dark. If a double handful is squeezed together and let fall the prunes should fall apart readily if they are dried sufficiently. Also the pit will not slip in the flesh when rubbed between the thumb and forefinger. If the fruit is not thoroughly cured when stored, frequent mixing or turning is necessary to prevent possible spoiling of the fruit before it is entirely cured.

### Yields and Drying Ratios

Prunes dry down from 2¼ to 3-1, depending on the variety, the French drying down the least. An average yield for the French, Imperial and Sugar prune is 2.12, 2, and 3 tons dried per acre respectively. However, the Sugar prune is not a consistent bearer.

# She Sells Sea Shells

By Ernest Braunton

SHE sells sea shells because a natural deposit of decomposed sea shells was found on her ranch. During the past year at several points, both at the coast and far inland, these rich mines of carbonate of lime have been uncovered and made available to the public so that through competition the price has been lowered to about one-half that prevailing a year ago, and large numbers of orchardists now find it highly profitable to use in liberal quantities.

### The World's Needs

Recognized authorities the world over are at present urging the more extensive use of lime in any and all forms as nearly all soils are deficient, especially those of granite formation. In the following excerpts from a bulletin of the United State department of agriculture, "The Lining of Soils" by H. J. Wheeler, it will be noted that two authorities speak of soils of granitic base as being especially benefited by application of lime:

"The recognition of the agricultural value of certain forms of lime is not new, and it appears probable from the writings of Pliny that liming was practiced by the Romans more than two thousand years ago. In England, Germany, France and other European countries the application of lime in various forms has been and is still practiced extensively.

"Deherain states that certain regions of France have undergone a veritable agricultural transformation owing to the use of lime and marl. Muntz and Girard assert that more than one-fifth of the area of France is of granitic origin, and that when the soils are supplied with lime and phosphoric acid, which they lack, they undergo a complete transformation.

"In certain sections of Germany carbonate of lime in the form of a marl plays an important part in maintaining the fertility of the soil. According to Wicke, the yields in certain districts of Germany have at times been quadrupled by the employment of marl, and many plants whose cultivation was

(Continued on page 191.)

At the annual meeting and picnic of the Butte County farm bureau Fred Cornehl of Wyandotte was elected president.

Statistician Kaufman of the state department of agriculture reports rice in Glenn County in fine condition now that the weather is warming up.

The Butte County farm bureau has organized a grain department which will market through the state exchange. Offices in the Waterland-Breslauer Building, Chico.

The old state fair pavilion which has stood at the corner of Sixth and M streets in Sacramento for 63 years is now being torn down. The present fair grounds cover 112 acres.

Peach growers of Sutter County have plenty of help for the harvest. Auto campers are coming from every direction to work in the orchards. A large majority of these workers will go to Butte County for the prune and almond harvest.

President Sheehan of the California Grape Growers Exchange says that more than two-thirds of the members have contracted with Eastern firms for their grapes at prices from five to 15 per cent higher than the 1922 schedule announced in June.

Sealers of weights and measures of the state held a two day conference in the assembly hall of the department of agriculture at Sacramento, August 3-4. Discussion chiefly concerned with discrepancy in scales, the weighting of bread and berry and fruit containers.

As a result of the "Hands Across the River" meeting at Chico last week a number of committees were appointed to push the work. The work of one committee is to complete plans for advertising the "Sacramento Valley Loop" highway by erection of signs at Davis and Red Bluff.

Eight million dollar bond election on Sutter project set for August 26. Counties affected are Sacramento, Sutter, Yuba, Butte, Yolo, Colusa and Glenn. Protesting land owners have appealed to the United States supreme court against decision invalidating the assessment for which bonds are to be issued.

## Central California

G. L. Wolf has been appointed fruit inspector at Turlock.

The community fair of the Delhi district, September 16.

Delhi and Turlock are making large shipments of sweet potatoes.

Today, August 19, has been officially proclaimed by Governor Stephens as Egg Day.

Oakdale, Stanislaus County, is making big plans for its district fair, September 21-23.

Watermelon shipments from Turlock continue fairly heavy, melons of unusually fine quality.

The California Farm Bureau Grain Marketing Association will establish a Tulare County office.

Ranchers in the Stoddard district of Stanislaus County report severe injury by army worms.

Turlock grape growers report selling Malagas and Zinfandels at $60 a ton; Thompson Seedless, $35.

A long dispute between ditch owners along Feather River and riparian water users has been adjusted.

Stanislaus County Poultry Breeders Association is planning to hold a poultry show at Modesto this fall.

The California Peach and Fig Growers has moved into its new headquarters at Inyo and Van Ness Streets, Fresno.

Manager Elliott of the swine department of the Tulare County fair is receiving many entries for exhibits of pure bred stock.

The Di Giorgio farm of 500 acres in the Weed Patch district of Kern County will close its melon shipping season with a record of 112 cars.

Farm center meetings will be held in Kern County ata Mountainview, 21; Pond, 23; Indian Wells, 24; Muroc, 25; Shafter, 28; Arviin, September 1.

Farm center meetings in Kern County: Mountain View, August 21; Pond, 23; Indian Wells, 24; Muroc, 25; Shafter, 28; Arvin, September 1.

The Weed Patch farm center of Kern County will hold its first annual community fair September 2 at the farm center hall near the Vineland school.

The Navel crop of the Porterville district is generally estimated at 65 per cent of normal. The drop on the outside of the trees has been unusually severe.

President Niswander of the California Peach and Fig Growers says that two weeks after peach prices were announced half of the new crop of dried peaches was sold.

The melon market improved last week at Turlock, prices on August 7 going to 80 cents, said to be the highest price paid for cantaloupes at this time of the year.

Thirty big combined harvesters are busy in the Tulare Lake grain district. More than 200 trucks are hauling the grain to warehouses at Corcoran, Guernsey, Stratford, El Rio, Angiola and Alpaugh.

The fig cannery of the California Peach and Fig Growers at Turlock has commenced operation. The cannery will handle about 20 tons of figs a day and it is expected the run will last about two months.

## Southern California

Oyster culture is being promoted by an Orange County man in Newport bay.

Experiments in growing Acala cotton at Perris, Riverside County, show satisfactory results.

Fogs in the central coast counties have been exceedingly favorable to the growth of Lima beans.

A bean drying plant is being erected on the Cadwell ranch a short distance west of Old Town, Ventura.

The bean crop for the state is now estimated at 92 per cent of normal compared with 79 last year.

Beekeepers of northern San Diego County are getting together on a project to pool their honey.

Walnut growers of Southern California will assemble at Santa Barbara, September 1-2 for their second annual field day.

The Arcadia center of the Los Angeles County farm bureau has organized a poultry club with T. H. Holmes president.

At the annual meeting of the Oxnard Citrus Association held at Hueneme it was voted to increase the capital stock from $30,000 to $150,000.

Manager Churchill of the California Lima Bean Growers Association has left for a tour of Eastern markets to prepare for the selling campaign.

Ventura County supervisors have voted an additional sum of $10,000 for building improvements. 100 additional stalls and pens for livestock will be built.

The grape shipping season for Imperial Valley is ended. A total of 180 cars was sent out against 51 last year. Coachella Valley has shipped out a total of 74 carloads.

Secretary McNaught of the Orange County Farmers Mutual Fire Insurance Company says his assocaition now has 5,378 policies in force, carrying $10,225,000 insurance.

The Ontario plant of the California Growers Association is started on a big peach run which will probably continue until the middle of October. The weekly payroll approximates $18,000.

Apple growers of Beaumont, Banning and Riverside sections met recently at Beaumont and passed resolution requesting the state department of agriculture to inspect apples before shipping.

The Los Angeles County farm bureau has arranged for field survey of several hundred citrus groves to establish best fertilizer practice. Prof. R. S. Vaile of the citrus experiment station will be in charge of the survey.

At the recent meeting of the Southern California Purebred Livestock Association committees were named for each of the Southern counties to make careful census of breeders and stock survey of feed conditions with the idea of taking definite steps toward improving stock conditions.

The state department of agriculture has arranged with the Riverside County authorities to place a quarantine inspector at the Blythe ferry to inspect automobile traffic arriving from the southern states. The work is to be carried on as a cooperative measure, the expense being borne by Riverside County and the department of agriculture on a fifty-fifty basis.

## The Coast and General

Showers over the ranges of Arizona last week helped out the feed situation.

A rainfall of 1.10 inches was reported from Flagstaff, Arizona, August 8.

Practically all of the loganberries in the Newberg district of Oregon are being sent to the driers this year.

The apple crop in Washington for 1922 is estimated at 7,750,000 bushels; in Oregon, 1,490,000; California, 1,704,000.

Most of the alfalfa seed has been harvested in the Yuma district of Arizona. Some early cotton is being picked.

The production of barley in the United States this year was estimated at 191,507,000 bushels; last year, 151,181,000 bushels.

Arizona's late summer honey harvest is practically completed except where bees had access to cotton and other cultivated crops.

The United States department of agriculture reports the world's visible supply of American cotton on August 1, 1,860,055 bales against last year at the same date 4,031,594.

Arizona's Thompson Seedless grapes are ripening 20 days later than usual. Berries have been full size for some time but deficient in sugar content owing to cool weather. Malagas, Tokays and Missions are about ready to ship.

The estimated production of Irish potatoes for the whole country is 439,900,000 bushels compared with 346,823,000 bushels last year. California's production is estimated at 11,309,000 bushels against 10,545,000 last year.

The first really good rains in the southeast and moderate showers in the north central portions have improved ranges and stock materially and replenished diminishing water supply, which is now reported good in most sections.

The price of milk for the Seattle markets has been raised as follows: July, $2.40 per hundredweight; August, $2.65, and September, $2.75. This, of course, applied only to milk which goes for the city trade and is based on a 3.6 test.

The American National Livestock Association and the National Wool Growers Association have brought formal charges of maintaining unjust, unreasonable and discriminatory rates on the sale and purchase of livestock and of conducting "an overdone and overmanned business" against the livestock exchanges at Chicago, Kansas City, Omaha, St. Paul and Portland and all commission men and market agencies at these markets.

The North Pacific Cooperative Berry Growers' Association has put up more than 1000 barrels of strawberries this season, most of which will be held for future sale. The association has found that it can in this way take care of a large quantity of surplus fruit and prevent its being dumped on the market at a low figure, or becoming a total loss. The season was very short this year and in spite of the fact that prices were low the entire crop of the membership was handled satisfactorily.

# Beating the Storm King: Putting in a Crop Despite the Weather

By Cornelius Roberts

LOOKING backward not later than the period of the touring car with a rear door one can remember when a great deal of farming land lay idle from year to year because weather conditions interfered with planting it. In those days when the tractor was a youngster and the draft horse was still the main reliance of the farmer it was not possible to seize upon a short period of sunny weather and get the planting job done.

If rains were continuous with a rainless period only now and then the farmer had simply to wait and watch the sky. This was particularly true on the lower lands where wetness interfered with cultural operations. But, thanks to the mechanical power of 1920, it is now possible to take advantage of these short periods of favorable weather and put in a crop over an area that would have taken weeks to cover in an earlier day.

Northern California had a striking example of the advantage of ample mechanical equipment last season. The winter of 1920-21 was one of almost continuous rains. By continuous rains I do not mean that it rained every day, but there were not long enough periods between wet spells to permit the soil to dry out. The word "California" ordinarily means "sunshiny," but California has and needs its rains just as do other states of the Union. The normal rainfall of the Sacramento Valley is from 20 to 35 inches, but usually comes in three months, December, January and February. For 1920-21 it was spread over a longer period, from November to the first of April. The result was that thousands of acres of land, normally plowed in November, December and January and sown to wheat and barley, could not be turned over until April 1 and thereafter. Since the harvest comes in the latter part of June and it is then customary to irrigate these lands and replant to beans, it will be seen that the period of time for planting grain was rapidly reaching the danger point.

How this problem was met by the Sutter Basin Company which has a tract of more than 45,000 acres, about half of which was being planted to cereals, will be described in what is to follow. This company, operating near the town of Maddock, in Sutter County, had probably 10,000 acres to plant to barley and wheat, and plowing was started about the first of April. In the meantime a large part of the land planted had brought forth a volunteer crop of barley and wheat. This volunteer in some cases was so lusty and thick that it was allowed to stand. But wherever there was a question as to its developing a big crop the decision was to plow it under and resow. In the old days before the big tractor, such an operation would have hardly been possible, for rank volunteer takes power to get it under.

When the soil was right for plowing this company started twenty-three 60 and 75 horsepower tractors to work. When I visited Sutter Basin I saw six of them in a 640 acre field following each other around as if they were on parade. It was a scene of feverish activity. The foreman of the crew was running around in a big automobile and a fuel truck was kept steadily busy carrying drums of distillate from the railroad station to a corner in the fields where the tractors stopped. Besides this there was a truck with a complete repair outfit, parts and the like, subject to call in case of a breakdown. Nothing was neglected to keep the army of tractors busy during the period of favorable weather.

Whenever I put a question to the foreman about the amount of work being done, he talked in "shifts." I asked what he meant and he replied that a "shift" was ten hours.

"See those headlights on the engines?" he asked. "They keep going night and day. A day's job for a tractor is 20 hours. The rest of the time is for tanking up, oiling and greasing. So you see each outfit requires two drivers and two men to operate the plows, one for each shift.

The foreman told me that those six tractors in the one field with their plows and harrows represented an investment of more than $60,000. The Sutter Basin Company owned 11 of its

(Continued on Page 177.)

Cultivating Beans with a Tractor Outfit

# Extortionate Meat Margins

By A. L. Spellmeyer

THE searchlight of fact directed towards the dark places may help bring a remedy. Publicity, like sunshine, sometimes cures. I hold no brief for any interests, and whether right or wrong suffer from a conviction that it is a patriotic duty to work for the livestock industry and meat needs of the country and to assist any development or give publicity to injustice which interferes with the best interests of production. To advocate stockyards, which I believe will help small man production, may not please some large cattlemen, and the statements that follow may not please some packers, but if these articles don't suit, you, ordinary farmers and stockmen who subscribe to the Cultivator, you can tell the publishers so, and they won't want to print them. If they do suit, you can say so. and the Cultivator which dares and has dared to stand strong for convictions will feel encouraged.

Last week and before you have been reading about the seven cent general steer offers. Last week I heard on excellent authority that a contract had been closed for August delivery beef steers at 7 cents f. o. b. Bakersfield. The association bulletins of July give up to 7½ delivered Los Angeles for steers and 6 cents for cows. One bunch of steers, the near fat end of a beef sale, is being topped off now in local yards, and the owner says he will get 8 cents for them.

While all this is going on you hear of straight out offers f. o. b. Arizona, of 5 cents for feeder steers, and this means over 6 cents delivered California, when freight expense and shrink is figured on weights here. We hear of 8 to 9 cent prices prophesied for the fall and winter fat steers.

This covers an average of 7 cattle, and lambs run about ten cents and hogs about 11, but I will give you a different story as to what an ordinary rancher within 30 miles of Los Angeles experienced last week. I am going to give you a story of extortionate meat margins that is plain and unadulterated robbery, considered from any margin that has in the average of the past 20 years been considered reasonable. I do not say what killers are making in net profit. They may be going bankrupt, but that has nothing to do with my contention. There must be competition as some 80 men or firms have slaughter licenses in Los Angeles County. It is not a fault of the Big Five packers as the independents adopt the identical margins. It may be too much overhead and too much competition and too little volume, but whatever it is, the condition is such that neither national, state or city government should tolerate it if there are any laws to apply in correction, and if not the people should speedily make some, for this is adding to an intolerable living cost, with consumers paying the high prices and producers suffering a constant corroding loss that is cutting production and food supply.

Last week a man had a carload of fat steers and cows to sell. These young steers weighed, after a 15 mile drive shrink 944 pounds so they were very fair. Their carcass shows it. The cows went some 860 on same drive and shrink, and were beef grades, not dairy breeding.

A call upon the abattoirs, independent and regular, brought identical price offering, viz: 5 to 5.50 for steers and 3.50 to 4 for cows.

One killer who has just bought 1500 head and was loaded up stated they were actually worth 6½ but he couldn't handle.

These cattle sold at five for steers and four for cows as the best price obtainable after driving 15 miles.

At this identical time steers are reported sold from a large producer 130 miles distant at 7 cents f. o. b. ranch. Is there any better argument that a market is needed in Los Angeles?

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

The orange tree from which buds were taken to produce the two original Washington Navel trees now in Riverside, which are parents of all the Washington Navel oranges in California, is still alive and in fairly healthy condition in the greehouse on the grounds of the department of agriculture. The tree is now considerably more than half a century old. This is particularly remarkable in view of the fact that the unnatural greenhouse conditions are so different from those which we usually consider are required by an orange tree. The Cultivator camera was brought to bear on this tree only a few weeks ago, and we hope we may later give a reproduction of this photograph. The photo on the cover of this issue was taken by Ernest L. Crandall, photographer for the department of agriculture and an artist who is winning fame with his camera. It was taken January 6, 1920. At this moment large growth of surrounding trees has shut in this one so that a complete view cannot be taken.

* * *

From the photograph on the cover it may be seen that the tree had more or less diffcult times in preserving its existence. At one time it was cut off four feet above the ground and a new top made. Much of the old trunk is dead and serves only to support the tree. This tree is one of the most prized exhibits of the department or agriculture and living proof, as are the orange orchards of California, of the great work which has been done by the bureau of plant industry.

* * *

Mr. Saunders, who was, more more than any other one, responsible for the introduction of this tree from Bahia, Brazil, made in his private note book references to the introduction of the Navel, from which we quote: "Some time in 1869 the then commissioner of agriculture, Horace Capron, brought to my office and read to me a letter which he had just received from a correspondent at Bahia, Brazil. Among other matters, special mention was made of a fine seedless orange of large size and fine flavor. Thinking that it might be of value in this country, I noted the address of the writer and sent a letter asking to be the recipient of a few plantings of this orange. This request brought, in course of time, a small box of orange twigs, utterly dry and useless. I immediately sent a letter requesting that some one be employed to graft a few trees on young stocks and that all expenses would be paid by the department. Ultimately a box arrived containing 12 newly budded trees, and, being packed as I had suggested, were found to be in fairly good condition. I believe that two of them failed to grow. I had a supply of young orange stocks on hand, and as fast as I could secure buds they were inserted in these stocks. The first two young plants that were sent out were sent to a Mrs. Tibbetts, Riverside, California. The lady called here and was anxious to get some of these plants for her place and I sent two of them by mail. They prospered with her, etc."

* * *

"We budded many hundreds from time to time and sent them to Florida, where it has never become very popular owing to its not bearing plentifully. Why it fruits better in California than it does in Florida is not known. In the orangehouse of the department it has never fruited heavily but is most profuse in flowers."

* * *

It is strange that this fruit which has brought such great wealth to California has been of practically no commercial value to Bahia, the place of its nativity. The tree has seemed to take to California conditions, and the fruit has been declared to be the finest citrus fruit in the world. The first planting in California was in 1876. Its worth was at once appreciated, but it was not until the Cotton Centennial Exposition held at New Orleans in 1884 that laboratory determinations gave to the Washington Navel the place of honor amongst citrus fruits.

* * *

The strike has ceased to be a strike and has become an insurrection. At this moment the effort seems to be not so much to secure justice to the workmen as to promulgate Bolshevism. The trouble is that those who are punished or who are suffering or losing money as a result of delayed freights and passenger service are entirely innocent parties.

* * *

It is estimated that California peach, plum, grape, orange and other fruit growers are losing a million dollars every 24 hours through freight refused or lost in transit because of delays. Growers who have toiled for a twelve month to produce food for striker and executive as well as other consumers, and at prices scarcely above cost, are now compelled to see the fruit rot or be disposed of at prices which make no return for even costs of production. The time was when Washington took a hand and the continuance of the injustice was stopped. Have the people no friend at Washington now?

* * *

As a result of present transportation and marketing conditions many a farmer or fruit producer is faced with the problem of serious losses. We are reminded of action taken by fruit growers of Ontario, Canada, especially by those with orchards lying along the northern shores of Lakes Erie and Ontario. These producers for years took the lean with the fat and when the report came back that owing to glutted markets their products had been dumped in the lake, possibly the next week made up the loss in part. But they were soon tired of this condition and ultimately organized cooperative marketing organizations which helped but were still insufficient. Finally they said "We will build our own canneries to handle this waste." Now when the glut comes former waste is thrown into the canneries and when normal conditions return to the market the fruit is disposed of in its fresh state. Economical, reasonable, even commonsensible.

* * *

Californians—some of them—have also been wise along this line. But many are not so situated as to cooperate with their neighbors, hence the home canner and the home dryyard have been of value. It takes a wealth of water, of fertility and abundance of hard work to produce California fruit. Let us save it all.

---

## A FIELD

George Washington fathered and laid the foundations for the greatest nation on earth. He dreamed and helped plan and builded a beautiful city which might be exclusively the nation's own. He was a great engineer, a greater general and the first and greatest of our presidents, but he was far from the greatest of farmers. His farm was known as Mount Vernon. It contained some 5,000 or 6,000 acres. It raised considerable tobacco, a little corn, some beans and sweet potatoes. It had a private deer park of a thousand or two acres, and the homestead possessed wide expanse of rolling lawns and a view of wonderful beauty up and down the Potomac. It is possible Mr. Washington, farmer, made the old place pay, but history has it that after his death the heirs failed to keep up the taxes, and year after year small farms were parceled off and sold to any buyer to cover the delinquent taxes.

These farms were not rich. They were Virginia farms, furnished with a soil of red clay mixed with liberal supply of coarse gravel. The liberality of the gravel increased in the subsoil, which is often underlaid with soft sandstone. Occasionally there are little valleys, or a strip of bottom land just above the marshy river edge, where corn and tobacco are looking well. But in general the question first in the mind of a farmer who has seen California's rich valleys is "Why is a Virginia farm?"

George Washington, as a young engineer, saw much of America, as far west as Eastern Ohio, so why did he choose those Virginia hills overlooking the Potomac? I think it must have been because of his appreciation of the beautiful and that his eye, trained in engineering, was fitted to judge the landscaping possibilities with those hills of wild grape, honeysuckle, oak and scrub pine.

Whatever Washington accomplished in farming he created a great estate, a small portion of which is today our most loved shrine. For a half century after his death, Mount Vernon remained in the Washington family—such of it as was not sold off each year. Then patriotic women organized and purchased from the heirs the small remnant of about 200 acres, and the old place, including the mansion, servants quarters, flower and vegetable gardens and that portion of the place which Washington in his will stipulated should be retained for a tomb for the Washington family, is now controlled and owned by all the people for all time.

### Virginia Farms

One farmer said: "No, our farms are not much like those out west in Ohio and beyond, but we're building up a little with more dairying and the use of soy beans and other green manure crops. Occasionally one sees a corn field of, say, an acre—once in a great while, larger—of which a little more than half is worth while. If the land rises in a knoll the sides are sure to show dwarfed and yellow stalks perhaps a few inches high, while the crop on the lower level is of stalks of six or seven feet, and with sizeable ears almost ready for the roasting. Tobacco appears to like the conditions better and is looking well.

Speaking of tobacco, it was once "legal tender," and a nearby great estate was bought some time back in the 17th century for some 1100 pounds of tobacco. Now a day's ride from the city of Washington through Richmond, Petersburg and on south toward Raleigh, North Carolina, shows but few tobacco fields.

### Millions in Goldenrod

If one could only coin all the gold in the goldenrod in these tens of thousands of acres of it he could soon establish a great estate on the banks of the Potomac. Some fields which seem to be abandoned as crop producers and which are now returning to nature's way and growing up to scrub pines and other natives, prefer to spend a year or two in battle royal between the goldenrod, ferns, lilies and other mild mannered plants and the small forest trees. This battle is of short duration, for the trees are sure winners.

### Erosion

I have solved the problem of these poor crops on the hillsides. For some 200 or 300 years these hillsides have been cultivated and the summer's thunderstorms have torn away the best soil and put it in the hollows. Many a planter is now planting rows on contours, and some have continually plowed in such a way that small terraces have been formed. This may help to save the day in the future, but present conditions must make it a rather heartaching proposition.

"In the Blue Ridge mountains of Virginia," makes good singing, but awful poor farming. Farther south cotton, tobacco and watermelons and more diverse crops appear. At one station we met a long freight train, every car filled with watermelons.

Civilized man finds some use for everything. So scrub pine has found its place. For miles I noted occasional piles of pine, like four foot stove wood only cleaned of its bark, much as is the pulpwood up in Canada. But in this case the use is not for pulpwood, but for excelsior. The small pines six or eight inches in diameter are sent to mill, shredded and baled, and the scrub pine becomes useful.—C. B. M.

# A FEW FACTS About Frost Protection With Kell-Oil Heaters

The serious losses sustained in California, during the freeze of the past winter, also losses at various times, bring before the growers the need of protection to prevent such losses.

In order that the growers may become familiar with modern methods of Frost Protection with fuel oil heaters, the following analyses of requirements are given: **EFFICIENCY, CAPACITY, DURABILITY and COST.**

## EFFICIENCY

The efficiency of a heater is measured by the amount of heat produced from fuel consumed. To accomplish this economically established basic principles must be adhered to. The first requirement is perfect combustion, and this is obtained by furnishing the necessary amount of air, and bringing it into contact with the fuel gases in that part of heater known as combustion chamber, the outer surface of which is known as radiating surface. The proper location of the air-intakes, located at the most advantageous points, furnish the oxygen to bring about perfect combustion. If these air-inlets are not perfectly located, imperfect combustion will be the result, and consequently a waste of fuel.

Part of the combustion chamber in most cases consists of a pipe or stack the surface of which is the principal radiating surface of the heater, and therefore should be of ample capacity, and also of sufficient height to insure good draft, as there is no economical heat production without sufficient draft. This must not be misconstrued, owing to the sound or roar that may be created.

A certain amount of fuel under combustion will make more of a roaring sound with a five-inch stack than it will with a seven, but the seven-inch stack has forty per cent more radiating surface than the five-inch, and therefore will furnish forty per cent more heat, providing the inner construction of the heater is properly proportioned and sufficient air is admitted at proper points below the stack. The heat loss will go still further, as the smaller diameter stack will give more force to the ascending gases in the stack and therefore bring them up at a much higher point outside of the heater, in fact, too high to be of practical heating value. This would not be the case with a larger stack. If heaters are working properly there will be almost an entire absence of smoke; imperfect combustion is shown by the amount of smoke, and this simply means a waste of fuel. It is very important that this is well kept in mind.

## DURABILITY

It will be readily seen that a certain per cent of heater equipment is lost where light weight materials are used, owing to rust and exposure to weather.

There is no question as to the advantage of using a cast iron heater, providing the cast iron is of a high grade, and of a very close texture to prevent a seepage of oil through the pores.

Growers will recognize these facts as experience with light weight heaters demonstrates the need for a more durable material.

Kell-Oil Heaters are made from "strokel" iron. This is a high grade cast iron of very close texture and high tensile strength, of exceedingly long-lasting qualities, and was developed by H. D. Keller and used by the Homer Furnace Company of Coldwater, Mich., in the manufacture of artillery hubs and flanges for U. S. Government during the world war.

## CAPACITY

There are all kinds of opinions as to the capacity of a heater. In considering this, we must first consider that all heaters should be cleaned after ten hours' burning. A heater large enough to operate ten hours, that is one that has sufficient capacity, is all that is required, in fact very seldom is a heater operated over eight hours in one stretch. Now if the oil-containing part of heater were large enough to run two or three nights in succession, it is most likely that the cleaning out would be neglected, which is not the case where the heater is only of ample capacity for one night's run. Cleaning is absolutely necessary in any oil burning heater to accomplish the best results, and the construction should be such that this can be done in the shortest possible time.

The oil-filling arrangement should also be such that, if desired, will enable the filling of heater without extinguishing the fire.

## COST

In figuring the cost of protecting a certain amount of acreage, the first thing to be determined is the heat furnishing capacity of the various heaters. Next, the length of life, or durability of heater, and finally the cost in dollars and cents. We will give two illustrations. First, we will take a heater with an average three-year limit of life. We will assume that it will take forty of such heaters to the acre, and we will assume that they can be bought for two dollars and one-half each, figuring interest on the investment at 8%. The investment will be one hundred and eight dollars, and this divided by three, the number of years, will bring the annual cost to thirty-six dollars per acre for heaters.

We will now assume that Kell-Oil heaters are used, which have an average life of considerably more than ten years (in fact they are practically indestructible) and that, owing to the fact that they deliver 40% more heating capacity than the best of other makes now in use, only thirty heaters per acre are required. Assuming the cost is six dollars each, this with interest figured at eight per cent would amount to one hundred and ninety-four dollars and forty cents per year, but on account of the difference in length of time that the heater will last, this would only cost nineteen dollars and forty-four cents per year, in a way of depreciation. The fuel carrying capacity for the year's requirements and storage containers for the fuel would be the same in either case, and would therefore make no difference in cost of operation, only to the extent that where the least number of heaters were used, that cost of care in case of a freeze would be less.

**KELL-OIL HEATERS PRODUCE 40% MORE HEAT**

*And Have More Radiation Close to the Ground Than Any Other Heater Ever Before Offered in California*

**Do not order your Protection until you see the Kell-Oil Heater.**

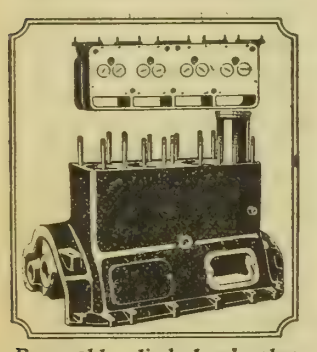
*These cut steel spur gears, carried on roller bearings and running in oil, transmit more of the engine power to the drawbar.*



*Removable cylinder head makes it easy to keep engine clean and valves properly fitted. Cylinder barrels are replaceable. These features save time, money, and increase the efficiency of the tractor.*

# A *Better* Tractor

Here is the new Case 12-20—a better tractor.

It is a compact machine, of the size that is most profitable to most farmers—a tractor that will pull three 14 inch plows or drive a 22x36 Case thresher under ordinary conditions. It is equally satisfactory for traction or belt work.

Besides being far above the average in efficiency and fuel economy, this tractor is good for many years of service after the average tractor would be worn out.

The Case 12-20 is durable because:

It has ample power to take care of its load without over-taxing the engine.

It has a rigid one piece frame which holds all bearings, shafts and gears in permanent alignment.

All bearings are of more than adequate size and are positively lubricated.

All working parts are enclosed in dust and dirt proof housings, operated in oil and are easily replaceable.

Some of the special features which add to the durability of this tractor are—a patented Case air washer, removable cylinder barrels, new two piece pistons, gears of special steel, roller and ball bearings throughout.

A booklet on this tractor is now ready. Write for it today. Also, ask for the new book "Better Farming with Better Tractors."

# California Fruits and Nuts

By E. E. Kaufman, Statistician California Cooperative Crop Reporting Service

Fruiti crops show improvement over month ago, apples being now 87 per cent onrmal as compared with 60 last year and a ten year average of 76. Forecast of production indicates 7,867,000 boxes as against 6,500,000 boxes in 1921. Forecast indicates approximately 420,000 tons peaches as compared with 320,000 tons in 1921. Pears show slight improvement; shipments are running slightly larger than last year, crop in the neighborhood of 100,000 tons. Apricots have turned out considerably better than early estimates. Last year the total crop was about 105,000 tons; this year it will probably amount to more than 120,000 tons. Prunes also improved slightly,, as some localities find a better crop than early reports indicated. The total crop will be very close to 100,000 tons. Plums show no change in condition since July 1. Shipments have been very heavy, running considerably more than last year at this time. The crop will be from 15 to 20 per cent larger than in 1921.

### Citrus

The citrus crop declined during July as the "drop" continued. Oranges estimated 56 per cent normal as compared with 86 last year and a ten year average of 76. A light crop however will have a tendency to increase the size of the individual fruits and large sizes can be expected from the present crop. The lemon crop is estimated to be only 53 per cent of a normal as compared with 84 last year and a ten year average of 80.

### Figs and Olives

Fig crop higher than on August 1, 1921. Shipments of fresh figs are now being made and will be materially increased over last year. The production of canned and preserved figs will be greater than in any former year. Olives show a very spotted condition, one of the leading counties reporting only 20 per cent of a crop while none of the leading olive counties show better than a 60 per cent crop. Less than half a normal crop for the state as a whole is now indicated.

### Almonds and Walnuts

It is safe to predict more than 9,000 tons of almonds will be produced in the state this year. Quite a marked improvement is noted in the condition of the walnut crop. Early reports from Ventura County, particularly, indicated severe damage from frost. The latest estimates, however, minimize this damage, and practically a normal crop is now reported from that district. With the increase in bearing acreage and older trees it is more than likely that the total production will be equal to or greater than the record crop of 1919, when more than 28,000 tons were produced.

### Grapes

Condition of wine grapes remains at about normal and the total production will be very close to 400,000 tons. Raisin grapes were slightly sun burned in some localities and consequently slightly lower condition was reported as compared with July 1. However, at the present time the crop bids fair to be a record breaker and will probably amount to about 220,000 tons. No change is indicated in the condition of table grapes and the total production is forecasted at about 175,000 tons.

# California Crop Report August 1.

From report issued by E. E. Kaufman, statistician, California cooperative crop reporting service:

Conditions were generally favorable during the past month for both field and fruit crops. Temperatures remained comparatively high during the month but no material damage was indicated. In fact, it is generally believed there was some improvement through the hastening of the ripening of some of the fruits. The corn crop showed a slight improvement in the principal corn growing section and the forecast of production shows 4,215,000 bushels as against 4,060,000 bushels on practically the same acreage in 1921. The preliminary estimate of the production of wheat throughout the state indicates the largest average yield per acre for over 20 years. Conditions were very favorable to this crop where sown on summer fallowed land, and large areas have averaged from 15 to 20 sacks per acre For the state as a whole the preliminary estimate is placed at 21.5 bushels per acre which on the estimated area to be harvested, gives us a crop of 14,900,000 bushels. Harvest is practically over except in the extreme north and northeastern counties. Oats show a slight improvement compared with July 1.

As the barley harvest progressed it was noted that the production was going to be larger than indicated by early condition reports. August 1 showed an improvement of 4 points in the condition, the crop now being estimated at 94 per cent of a normal as compared with 80 last year and a ten year average of 83. On the basis of our preliminary estimate of acreage, a total crop of 38,400,000 bushels is now indicated. The rice crop improved slightly the past month particularly in the northern counties in the Sacramento Valley. On the assumption that the estimated area planted will all be harvested and that average conditions prevail until harvest time the probable crop will amount to about 3,780,000 bags, 100 pounds each.

# Tractors to Pull Crowd.

Mr. Farmer has marked his calendar as a reminder that the Sacramento state fair opens on September 2 and continues until the last fireworks sputter out on the night of the 10th. And this year Mrs. Farmer is coming, too! For the past two years Secretary Payne has carefully studied what the women like. This year the grounds will be cleaner than ever before. There will be good music—and plenty of it. There is a playground for the babies. There are adequate rest rooms. A visit to the fair insures pleasant change of scene, the meeting of many friends, lots of fun and something educational.

### Record Tent Erected

The California Tractor and Implement Club has again arranged for elaborate and thorough exhibit of the newest developments in power farming. There are 60,000 square feet under canvas in the big tent and near it a complete showing of pumps and allied equipment. The exhibit will be even more confusion free than in past years, for the whole show is under the expert hands of W. V. Freeman.

Here's a partial list of the exhibitors: International Harvester Co., H. C. Shaw Co., L. D. Armstrong Co. (Trundaar), Cushman Motor Co., F. A. Frazier Co. (sprayers), Standard Oil Co., Oliver Chilled Plow Co., Fordson Dealers, Schmeiser Manufacturing Co., John Deere Plow Co., Union Oil Co., J. I. Case Plow Works Co., Advance-Rumley Co., H. V. Carter Motor Co. (Allis Chalmers, Beeman), Pacific Implement Co., Lytle Scraper Co., Killefer Manufacturing Co., Chas. Berg Imp't. Co., (New Britain), Junior Monarch Hay Press Co., J. I. Case T. M. Co., Cleveland Tractor Co., Yuba Manufacturing Co., Harris Mfg. Co., Pacific Tractor & Machinery Co. (Henneuse), Holt Manufacturing Co., C. L. Best Tractor Co., Knapp Plow Works, Shell Oil Co., Edward R. Bacon Co. (road machinery).

### Forerunner of Better Business

With prices at rock bottom, with fac-

tories again in lively operation; with farmers replacing old and worn equipment, there has this year been an eagerness among all tractor and implement firms to make attractive display of newest devices to the critical eye of the California farmer.

Do you know what a crowder is?

Do you know about the new science of sub-surface irrigation?

Have you heard about the latest spraying method?

Do you know how to rig up your pump to get fire protection on your farm?

These questions and many others you will find an answer to in the big tractor tent in Sacramento.

### BEATING THE STORM KING: PUTTING IN A CROP DESPITE THE WEATHER

(Continiued from Page 173.)

own engines and plowing outfits and was using 12 more at so much per day. These big outfits, fully manned, command about $5 an hour.

Four of the six tractors were plowing 120 acres in a 10 hour shift which means that they turned over 240 acres a day. They were followed by tractors of similar size with disk harrows, cutting up the clods, chopping the volunteer barley and wheat and working down the seed bed.

But this is not all of the operation of putting in a grain crop between wet spells. The foreman took us to another field where the plowing and disking had been finished. The field, too, was a-sputter with tractor activity. Three 60 horsepower engines, each with from 40 to 50 feet of grain drills, were busy here putting the seed in the ground. One of these outfits, the foreman said, could seed 100 acres to wheat or barley in a ten hour shift, which means that the three outfits were capable of putting in 600 acres in a day. While we were watching this work the seed wagon drove in sight and one of the tractors stopped to take on a few sacks of wheat. The next arrival was the water boy who dashed onto the field at the wheel of a light, pneumatic tired motor truck and distributed canteens hurriedly. He passed the water cans to the men while their machines were moving. No valuable time could be spared.

The tractor has proven a mighty versatile brute. In another field that day we saw a 40 horsepower machine with 50 feet of spike tooth harrow behind it. Sutter Basin bean and sugar beet growers used tractor outfits for their cultivators. I do not mean special tractor cultivators. These farmers used tracklaying machines to draw the regular horse cultivator outfits.

Another period of feverish activity is to come for those big machines which have turned over the soil and put in the grain, for double cropping is practiced in California wherever the soil is rich and water for irrigation is available. When the barley or wheat comes off it is the practice to irrigate the land, plow again and put in some late crop like beans. Here again the time is short and it is necessary to get the harvester over the land quickly, turn on the water and get the beans into the ground. If beans are not planted by the first week in July farmers must look forward to all sorts of troubles incidental to late harvest and the approach of the rainy season.

When one sees farming as it is practiced in this age of big engines, he marvels that our forefathers were able to raise enough to eat with their crude implements. Yet it seems that the farmer works just as hard today and puts in nearly as many hours as did his father in an earlier day. In the broad view it must be admitted that mechanical power on the farm, with its greater production per man, has had no small part in raising the standard of living in America and in permitting the average city man as well as his country brother to go out for a Sunday picnic with his family in his motor car.

### DOWNEY COMMUNITY FAIR

Seventh Annual Downey Community Fair will be held at Downey, August 24 to 26. There will be exhibited fruit, vegetables, poultry, goats, rabbits, canned goods, fancy work, art, etc., representing the various industries of the community. The tent will cover a space of 100 by 350 feet. In this will be shown automobiles, trucks, farming machinery, and there will be a large stage to accommodate musicians and speakers. Fair will open at 10 a. m. of the 24th, grand parade at 10:30, speaking at fair grounds at 11:30. The management of the fair is bending every effort to make this the biggest and best fair ever held in Downey. All Southern California invited.—W. M. Booth, President.

### AVOCADO ASSOCIATION REPORT

The 1921-22 annual report of the California Avocado Association is out and, like its predecessors, is better than any previous one. Two features in which it excels are the Hertrich report on frost injury and the Nirody paper on avocado breeding. The first gives temperatures experienced and varieties injured at many points in the five southern counties. On these experiences future planting may be intelligently based. In the Nirody paper are suggestions of the proper varieties to cross breed to get the best commercial types, with the reasons therefore; a really scientific treatise which should be a guide to future breeding experiments. This year book is sent free to members and may be had by others if one dollar is sent to the secretary, Karl M. Wagner, 2160 East Seventh street, Los Angeles.

### TEXAS MELON GROWERS OBJECT TO SLATTING CHARGE

The Texas Watermelon Growers Association is trying to remove charge of $5 per car for slatting stock cars used in transportation of melons. The growers contend that because southern carriers cannot supply regular ventilated fruit cars the charge for slatting should not be borne by the growers. The transportation department of the American Farm Bureau Federation is aiding them in presenting the matter to the railway rate committee.

### PURE SEED NETS GROWERS $3.804,000

A survey of the state just completed by Professor G. W. Hendry of the University of California shows 634,000 acres of University cereal varieties to have been planted this season as follows: Mariout barley 350,000. Tennessee Winter barley 200,000, Bunyip wheat 40,000, Yolo 20,000, Four Thousand barley 10,000, Honey sorghum 7,500, Selected Milo 5,000, Federation wheat 1,500.

All of these varieties were first tested on the Davis trial grounds prior to distribution and found superior in yield to previously grown varieties and estimated to have added about $6 per acre to crop values, or a total annual increment of $3,804,000. This amount capitalized at four per cent represents a permanent agricultural endowment of $95,100,000.

Nearly all the large streams of California have their headwaters in the national forests. Many furnish drinking water. For the purpose of securing better sanitary protection on lands within the national forests the California state board of health will deputize forest officers as sanitary inspectors..

Touring Car

The GUARANTEED Car That Makes Good Oakland's Promise

Many months ago the Oakland Motor Car Company announced its purpose to build the finest light-six in the world. It was admirably equipped to undertake this difficult task.

As a permanent division of General Motors Corporation, it was enabled to utilize the technical genius of the General Motors laboratories, as well as its own six years of experience in manufacturing light-sixes exclusively.

Oakland held fast to its purpose. It built the finest motor car that the sum of this engineering and manufacturing genius could build. It called this car The New Oakland Six-44.

So certain was Oakland that its new car was *right*, that it placed upon it —in addition to the manufacturer's standard warranty—a special written 15,000 mile performance guarantee.

Many thousand New Oaklands are now in service. If you would learn whether Oakland has accomplished its high purpose—question any one of these thousands of owners.

They will tell you that they have never driven a car more powerful, more flexible, more economical or more unwaveringly dependable.

They will praise its wonderful six-cylinder, overhead-valve engine, which insure such abundant power with all of the flexibility and quiet natural to a six.

They will tell you of its unusual pulling power through mud and sand; of its uncommon hill-climbing ability; of its troubleproof construction which makes it such an ideal car on the farm and in communities far removed from service or garage facilities.

Nor will they fail to tell you of the care and attention given to details of comfort and convenience: long, buoyant springs; unusually roomy body; door-opening curtains; genuine leather upholstery; cord tires, and other similarly high grade and complete equipment. Examine this New Oakland yourself.

Remember, it is the only car in the world that carries, in addition to the manufacturer's standard warranty—a special written 15,000 mile performance guaranty; and yet—at the reduced prices announced August first, it is one of the world's lowest-priced sixes.

*Oakland's special, written, 15,000 mile engine guarantee is conclusive proof of high quality in every part of the New Six-44. It is possible to give this unusual guarantee only because of this high quality. The guarantee PROTECTS you; the New Oakland car will do infinitely more — it will satisfy you COMPLETELY in every thing that you demand in a fine motor car.*

OAKLAND MOTOR CAR COMPANY, *Pontiac, Michigan*
*Division of General Motors Corporation*

The New Oakland Six

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Oil and Soda Dipped Raisins

What are dipped and bleached raisins? What do they look like? Is the taste changed in any way? Please describe the process if it is not asking too much.—Reader.

We know of no better answer to these questions than is given in the "Dear Al" letters written by Mr. Howard of the Sun Maid Growers to explain some of the problems of raisin production to the sales force.

"Because of the poor drying weather in some sections at raisin curing time it has been found necessary to devise a method to hasten the drying time, so the growers dip the fresh fruit in a weak lye solution. The growers around Marysville have places fixed up with two large vats. One of these vats is fixed with oil or steam heat to keep the dip warm, or rather 'hot.' This hot dip contains about one per cent lye.

"When the Thompsons are ripe, they are picked in boxes and hauled in to the dipper, and are dumped into a wire hopper which is on the end of a pole arrangement which made me think of the 'old oaken bucket.' The basketful of grapes is immersed in the hot alkali water and almost immediately lifted out and allowed to drain. They are then swung around and immersed in the clean water for rinsing and then placed on the drying trays.

"The purpose of this hot dip is to slightly crack or check the skin of the grapes, thus permitting it to dry more rapidly. The experienced men up there can tell at a glance if their dip is the right temperature—if there is lye enough in it, and if they have been immersed long enough to acccomplish the desired result. After the grapes are placed on the trays they are hauled out to the dry yard and dried in the sun the same as the natural raisins. The finished product, Al, is what you sell as soda dipped raisins. Just like any other raisins except that they have been dipped to crack the skin, thus promoting more rapid drying. Of course, the color is somewhat changed, as well as the flavor.

"I suppose you are wondering what oil dipped raisins are, and that story is briefly told. The same sort of dip is used except olive oil is added, and as the grapes are dipped, a thin coating of oil adheres to the fruit. The oil dipped raisins are darker in color and will usually remain in a soft pliable condition for a longer time.

"The sulphur bleached raisins are handled the same way except that after they are placed on the trays they are stacked in tight compartments called sulphur houses, and subjected to the fumes of burning sulphur for several hours. The action of the sulphur fumes causes the fruit to bleach after it is exposed to the sun, and if the fruit is of good quality and the dipping and sulphuring properly done, they will be a beautiful, clear, golden yellow in color. You know what they look like better than I do Al, I'm sure.

"After all, the big thing to remember about these dipped and bleached raisins is that they are the dried product of the raisin grape but are cured in a different manner. They are all dried in the sun, so they are really Sun-Maid raisins, and there is nothing mysterious or harmful in their make-up."

### Melons Not Blooming

Please tell me the trouble with my watermelons. Fruit will not set. They bloom and bloom, but that is all. They were planted early and some were nipped by frost.—Subscriber, Bakersfield.

If you were in a coastal section we would ascribe non-setting of fruit to weather conditions. Cool damp weather often defeats pollination. But in your section this is quite unlikely to happen. Watermelons thrive best in a short hot season of growth. It may be possible, though not probable, that your vines are bearing only male blossoms, those with stamens. The female blossoms have none, only a central stigma. We will confess to being puzzled and several melon growers state they have never experienced such trouble.

### Cultivating Sub-Irrigated Land

Do fruit trees and grape vines need more than one cultivation during year on subirrigated land? Thanking you for your interest in the ranchers welfare, we very much enjoy reading the Cultivator.—Subscriber, Elsinore.

We think you will find that your trees and vines will do better even on sub-irrigated land if regularly cultivated. Cultivation keeps the soil in better condition and is usually necessary on such land to keep the weeds down.

### The Jujube Crop

Have noticed several articles in the Cultivator on jujubes, processing the fruits, etc. We will have between three and four tons of jujube fruits this year. Can you advise us of firms who might purchase?—Subscriber, Hamilton City.

Leading confectioners state but one firm in California produces glaced or candied fruits, the Lyons Glaced Fruit Company, San Francisco. All other supplies come from eastern processers.

### Size of Potato Seed

I have been told that to get large potatoes I should plant small ones. I have always heard that like begets like. Is it so?—Subscriber, Escondido.

It would take too much space to fully discuss the laws of breeding, etc. Like begets like within certain limits. A child is not necessarily representative of its father or its mother, but inherits the characteristics of the families of its parents; some in one factor, others in others. Your seed potatoes represent the particular variety and strain of that variety of which they are a part. If the strain has been a good one for several generations it matters little if you plant large or small ones, if not so small as to represent dwarfed individuals. Neither plant the very largest. Cut up and plant good sized, smooth, well formed potatoes and you will get best results. Cut into about four pieces, not more, and of nearly equal size.

### Wheat Counties

What counties in state produce the most wheat?—Subscriber, Gilroy.

According to the United States census of 1920, California produced 16,866,882 bushels on 1,086,428 acres. The acreage and yield of the ten leading counties were, in the order named: San Joaquin, 73,272 acres, 1,594,310 bushels; Yolo, 55,520 acres, 1,301,555 bushels; Solano, 42,828 acres, 1,035,049 bushels; Sacramento, 60,669 acres, 914,289 bushels; San Luis Obispo, 62,777 acres, 908,260 bushels; Kings, 51,984 acres, 892,852 bushels; Stanislaus, 51,397 acres, 797,106 bushels; Butte, 44,177 acres, 750,679 bushels; Tulare, 74,784 acres, 732,739 bushels; Sutter, 45,174 acres, 649,584 bushels.

### Cost of Producing Fruit

Have you ever published detailed statement of crop expenses for mixed deciduous fruits, comparable to the one you published for citrus? Am particularly interested in cherries, pears, peaches and apples.—Subscriber, Los Angeles.

Professor Adams in his book "Farm Management" gives the following average costs for raising an acre of apples, cherries, peaches and pears in California for the year 1919:

| | Per acre |
|---|---|
| Apples (400 packed boxes) | $365 |
| Cherries (4 tons) | 464 |
| Peaches (8 tons) | 136 |
| Pears (10 tons) | 181 |

This covers all labor and material used in connection with the growing and handling the crop but does not include marketing charges, interest on the investment or taxes.

The very high average cost for handling apples and cherries is no doubt due to the cost of packing boxes necessary for shipping these fruits whereas the peaches and pears are probably figured as being delivered to canneries, which would eliminate this expense.

Labor and material costs were high in 1919, and it would probably be safe to figure present average costs some 20 or 25 per cent lower than those given above.

It must also be remembered that the above figures are averages for the state. Local conditions may either raise or lower the amount of labor, water, etc. necessary for an acre production.

### THE NEW RAISIN PRICES

While the announcement of a considerable drop in raisin prices on the 1921 holdover crop came as a disappointment to some of the members of the Sun-Maid Raisin Growers, most of them realize that a drop was necessary if the market was to absorb not only the holdover from the 1921 crop but also the 225,000 ton crop expected for 1922. In a statement issued at the time the price was announced, F. A. Seymour, general manager, said: "We felt it was better to name a price which would move the entire crop rather than a higher one which would leave a holdover at the beginning of next year."

The new price schedule will be found on market page.

EASY NOW TO RID YOUR PLACE OF FLIES

Widely Known Scientist Discovers Wonderful Chemical That is Fatal to Flies. Not a Poison—Harmless to Stock.

Flies are one of the most dangerous and annoying things with which the farmer has to contend. Now, through the discovery of E. R. Alexander, widely know scientist, you can rid your house and barns and livestock of these pests almost instantly, and with no trouble at all. This discovery is in the form of an organic chemical that is fatal to flies, and similar pests, such as chiggers, mosquitoes and moths.

This new discovery, which is called Alexander's Rid-O-Fly, is not a poison. Though it kills flies like magic, farm animals and human beings are not affected by it at all. In addition to killing these insects, Rid-O-Fly is a strong repellant. Flies will not come near stock or buildings where Rid-O-Fly has been used. Rid-O-Fly is particularly valuable for cows and horses, as it is a known fact that flies do untold harm to these animals.

So confident is Dr. Alexander that his discovery will rid your house, barns and live stock of these pests that he offers to send a $2.00 supply for only $1.00 on the guarantee that if Rid-O-Fly does not solve your fly problems it will cost you nothing. Two big Kansas City banks guarantee the reliability of this offer.

SEND NO MONEY—just your name and address to the Alexander Laboratories, 1577 Gateway Station, Kansas City, Mo., and this introductory offer will be mailed at once.

## GARDEN ODDS AND ENDS

By Ramona Cordero

USUALLY our vegetable garden comes to a sad end. Why not gather up all the odds and ends and see what appetizing dishes we can make for the winter table? Pickles are always nice. Chili sauce adds much to the flavor of your meat course and how easily it is made! Cantaloupe pickle is very new and is a very good way of disposing of your cantaloupes before the frost catches them. They don't have to be ripe. Cut off the vine just before the stem cracks around the edge. Cabbage relish is good and well worth the time it takes to make it. All canning must be done in a closed kitchen. Wash and place jars in a large boiling kettle and cover with warm water, bring slowly to a boiling point. Have the heat very gradual or they will break. Keep lids very dry. (Bands don't need to be hot). Bring vegetables to a boiling point. Stand jar upright in boiling water and fill to the top with vegetables. Place on the lid and screw on the band. Let stand in warm kitchen till cool.

### Combination Pickle

One quart carrots, 1 cup celery, 1 green pepper, 1 cup white onions, 1 cup string beans, 2 pints vinegar, 1½ cups sugar, 2 teaspoons mustard, ½ teaspoon paprika, 2 teaspoons salt. Dice the carrots and cut the beans in short pieces. Cook them in salted water until tender. Add the other ingredients, cut in small slices, and add the vinegar, spices and sugar. Cook the mixture for two hours. Seal in hot jars.

### Chili Sauce

Twelve ripe tomatoes chopped fine, 2 medium sized onions chopped fine, 1 green pepper chopped fine; remove seeds and hard core which runs down side of pepper. Three cups vinegar, 3 tablespoons salt. Cook 1 hour, and then stir in 1 tablespoon cinnamon, 2 tablespoons sugar, 1 tablespoon mustard, 1 tablespoon celery salt, 1 teaspoon cloves. Cook 1 hour longer and if not thick enough cook longer. Seal in hot jars.

### Cantaloupe Pickle

Cut one underripe cantaloupe in small sections, (cut off outer skin). Soak the cantaloupe in ½ cup salt to 1 quart water for three hours. Take out of brine and place in colander to drain. Add the well drained cantaloupe to a pickling syrup made from 4 cups of water, 4 cups sugar, 1 cup vinegar, tablespoon of cinnamon, 1 tablespoon allspice, 1 tablespoon cloves. Boil the cantaloupe rapidly in this syrup for 15 minutes. Let stand over night. Then drain the cantaloupe again from the syrup and boil the syrup until it coats the spoon. Add the cantaloupe and cook until clear, which will take one hour or more. Seal in hot jars.

### Cabbage Relish

One quart cabbage chopped, 1 quart green tomatoes chopped, 1 pint white onions chopped, 1 cup sugar, 1 tablespoon mustard, 1 tablespoon celery salt, 1 quart vinegar, 1 large green pepper chopped fine, (remove seeds and hard core which runs down sides of pepper). Soak the cabbage and tomatoes in ½ cup salt to 1 quart water, overnight. Drain the vegetables for 15 minutes. Add the other ingredients and cook slowly for 2 hours. Seal in hot jars.

## HOUSEHOLD QUERIES

### Save Cultivator of June 17

I see in the Cultivator where you speak so highly of an article by Mr. Christie on jelly making. Would be very grateful if you would send me same as I was away from home about that time and suppose the paper was destroyed.—Subscriber, Millville.

Copy of the Cultivator of June 17 containing Mr. Christie's article on jelly making has been mailed to our Millville subscriber. We have had a great many requests for this article since it was published and are taking this occasion to again call our readers attention to its value and suggest that if your Cultivators are not all saved and filed you forthwith hunt up this issue and put it away for safe keeping.

### Canning String Beans

I think in the August 6 number, 1921, was an article on canning string beans without the cold pack process. Can you give me the recipe?—Subscriber, Norwalk.

This recipe was given by a subscriber who wrote that she had used it several years and found it simple, quick and satisfactory, that she "never lost a jar of beans canned by this recipe, and others who have tried it like it very much: To half gallon fresh string beans add ½ cup vinegar, 2 level tablespoons salt, 2 level tablespoons sugar. Add water to cover beans and boil 20 minutes after they come to boil. Seal while hot. In winter pour off all the water and cook as fresh string beans."

### Pickles of Various Kinds

Please give us some pickle recipes through the Cultivator. All kinds of cucumber pickles, sweet, and sour, and dill, also green tomato pickles and onion pickles.—Subscriber, Fresno.

Directions for making sweet, sour and dill cucumber pickles will be found in two preceding issues of the Cultivator. Following are others as requested:

Chili Sauce—Two quarts ripe tomatoes, (peeled), 4 green sweet peppers, 4 tablespoons brown sugar, 1 hot pepper, 4 onions, 1 tablespoon ginger, ½ teaspoon nutmeg, 2 tablespoons salt, 1 teaspoon cinnamon. Chop the vegetables, add the other ingredients and cook till tender (1½ hours). Then add 3 cups vinegar, boil 5 minutes and seal hot in jars.

Green Tomato Pickle—One gallon green tomatoes, ½ dozen large onions, 3 cups brown sugar, ½ lemon, 3 pods red peppers, 3 cups vinegar, 1 tablespoon whole black pepper, 1 tablespoon cloves, 1 tablespoon allspice, 1 tablespoon celery seed crushed, 1 tablespoon mustard seed, 1 tablespoon ground mustard. Slice the tomatoes and onions very thin. Sprinkle over them ½ cup salt and let stand overnight in a crock or enameled vessel. Drain well. Tie the pepper, cloves, allspice, and celery seed in a cheesecloth bag. Slice the lemon and chop 2 pepper pods very fine. Add all seasoning except one pepper pod to the vinegar, then add the drained tomato and onions. Cook for one-half hour, stirring gently at intervals to prevent burning. Remove spice bag to prevent darkening of the product. Pack hot in small jars and garnish with slender strips of the red pepper, placing them vertically on opposite sides of the jar. Place covers and rubbers on jars loosely and process 15 minutes at 212 degrees and seal.

Chutney—Four cups sliced sour apples, 8 cups chopped green tomatoes, 4 cups chopped raisins, 1 shallot chopped ¼ cup salt, 2 onions chopped, 4 cups brown sugar, 1 quart vinegar, 1 inch ginger root, 1 teaspoon cayenne. Mix all ingredients and cook gently all day. Cool, then boil hard five minutes, stirring constantly. Fill sterilized jars and seal.

Cucumber Ketchup—Three large cucumbers, 1 large onion, 2 tablespoons grated horseradish, 2 tablespoons salt, 2 cups vinegar, 2 tablespoons pepper, 1 teaspoon paprika. Grate cucumber and onion, add remaining ingredients, boil five minutes, bottle and seal.

Red Pepper Relish—Eight quarts red pepper, 2 quarts vinegar, 4 pounds brown sugar, 1 teaspoon salt. Remove seeds from peppers; cut peppers in narrow strips, using scissors. Cover with boiling water, keep on back of range ten minutes, but do not boil. Drain, cover with ice water, and let stand ten minutes. Repeat this process twice. Boil sugar, vinegar and salt 20 minutes. Drain peppers, pack sterilized jars with peppers, add syrup to fill jars. Seal and keep in cold place.

### Drying Apricots and Peaches

Please give me some recipes for drying apricots and peaches.—Subscriber, Los Angeles.

Cut in two and pit peaches and apricots. If you wish to sulphur place cut side up on shallow trays, one layer of fruit only, cover with tight box and burn sulphur under trays for about

# Are your nerves sound?

HEALTH authorities agree that children should let coffee and tea alone, that their nerves may be kept free from the caffeine drug disturbance, and grow up in natural health.

Isn't this suggestion good for you, too?

There's charm for all and harm for none in Postum, that satisfying, wholesome cereal beverage which contains nothing to disturb nerves or digestion. Make the test today.

# Re-Elect Hiram Johnson

There could be no more timely evidence of Senator Johnson's value to the State of California, in his present capacity, and the absolute necessity of returning him to the Senate for another term, than the important concessions he has gained for California growers in the tariff bill.

Johnson for California
California for Johnson

The increased rates on California products obtained by Senator Johnson are as follows:

| | House Rates | Senate Rates |
|---|---|---|
| Almonds, unshelled | 4c per lb. | 5c per lb. |
| Almonds, shelled | 12c per lb. | 15c per lb. |
| Walnuts, unshelled | 2½c per lb. | 4c per lb. |
| Walnuts, shelled | 7½c per lb. | 12c per lb. |
| Beans | 1¾c per lb. | 2c per lb. |
| Raisins | 2c per lb. | 2½c per lb. |
| Figs | 20c per lb. | 40c per lb. |
| Rice | (Same in House and Senate) | |
| Honey | 2½c per lb. | 3c per lb. |
| Olives | (Same in House and Senate) | |
| Olive Oil | 56c per gal. | 60c per gal. |
| Olive Oil in bulk | 49c per gal. | 50c per gal. |
| Lemons | 2c per lb. | 2c per lb. |
| Citric Acid | 12c per lb. | 18c per lb. |
| Citrate of Lime | 7c per lb. | 6c per lb. |
| Lemon Oil | 20% ad val. | 30% ad val. |
| Live poultry | 2c per lb. | 3c per lb. |
| Dead poultry | 4c per lb. | 6c per lb. |
| Eggs, in shell | 6c per doz. | 8c per doz. |
| Eggs, frozen | 4c per lb. | 6c pre lb. |
| Eggs, dried | 15c per lb. | 18c per lb. |
| Quicksilver | 35c per lb. | 25c per lb. |
| Casein | Free | 4c per lb. |

Oranges and grapefruit were not included in the House bill and were cared for in the Senate through the efforts of Senator Johnson.

*Look at this shingle a moment*

You will see little holes, or pores, through which flowed the sap in the living tree. In new shingles much of this natural oil is still present. But if roofs are left unprotected, the weather dries out the wood, causing it to warp and crack.

You can keep *your* shingles "alive"—by treating them with ORONITE SHINGLE OIL. It penetrates the wood fibre, fills the pores, and retards evaporation of natural oils. Rain cannot easily soak in, nor can sun or wind effectively attack roofs or shingled side walls treated with this excellent preservative.

Our agent, near you, has formulas for mixing ORONITE SHINGLE OIL with colors. Have him show you how easily it may be applied.

STANDARD OIL COMPANY
(California)

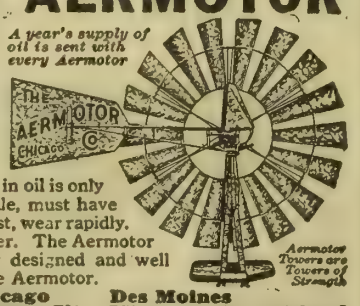
**ORONITE SHINGLE OIL**

**THE AUTO-OILED AERMOTOR**

**A Real Self-Oiling Windmill**

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

*A year's supply of oil is sent with every Aermotor*



*Aermotor Towers are Towers of Strength*

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

three hours. Then place trays in sun and turn frequently to hasten drying. (To turn put empty tray over full one and reverse). If weather is very hot it will be better to pile trays on top of each other when fruit is nearly dried so that fruit dries in the shade. Sort out the fruits that are slow in drying and place again in sun. Do not let the tray full get hard while waiting for a few moist pieces to dry. Properly dried fruit should be soft and leathery. Pack the dried fruit tightly in large boxes and "sweat" for a few days. This will equalize the moisture, making the fruits more uniform. Dip in boiling water to kill insects or eggs, dry again and pack in cans or jars or in paper bags placed in boxes or cloth sacks. If fruit is very dry drain after dipping and pack without redrying. Examine in a couple of days to make sure no fruit is molding. If it is take out, pick over and redry. Examine fruit occasionally where it is stored to make sure no insects have found it.

### Salt in Scalding Figs

Would like to know if there is any rule as to the amount of salt to be used in the water when scalding figs preparatory for drying.—Subscriber, Porterville.

About four ounces salt to one gallon water.

### Horseradish—Milk Drinks

Can you give me some information in your columns as to when and how to prepare horseradish for the table. Also cooling drinks to be made of separator milk.? Thanking you in advance for the service I feel sure of.—Subscriber, Roseville.

Clean the horseradish roots, scrape or peel outer rough part, then grate or put through fine knife of food chopper the white root, add strong vinegar to taste. Bottle.

For cooling drinks from separator milk see Page 85 of the Cultivator of July 22. Combinations with rich fruit syrups will be especially good with this skimmed milk.

### Pickles—Grape Juice

Will you please publish in your paper recipes for the following: Spiced small sweet cucumbers, pickled Seckel pears, preserving grape juice without sugar, green tomato pickle?—"Subscriber, Yorba Linda."

Directions for making spiced sweet cucumber pickles may be found on Page 62 of the Cultivator of July 15; for green tomato pickle in the Cultivator of August 12. If this subscriber has not saved these copies of the Cultivator and will send her name and address we will be glad to mail them to her. The request was merely signed "Subscriber, Yorba Linda."

Seckel pears are pickled whole, with stems if possible. Select, of course, only absolutely perfect fruit, inspecting blossom end carefully to see that no insect has made entrance there. Wash pears carefully but do not peel. Stick three or four whole cloves into each pear. Meanwhile have cooking a rich syrup of 3 pounds sugar, 2 cups vinegar (this amount for 6 pounds pears). Add spice bag containing 4 tablepsoons whole cloves and ¼ cup mixed spices. Add a few pears at a time to the boiling syrup and cook until tender, handling carefully so that skin is not broken. Fill carefully into small fruit jars and seal. Many prefer not to put cloves into the pears as this darkens them, but most of us are like children; we like to pick out the fragrant cloves and munch them.

Grape Juice Without Sugar.—Crush grapes with the hands or with potato masher. Heat slowly to 140 degrees. Red grapes should stand about 12 hours after heating to extract color. Use a thermometer. Grapes may be squeezed through a cloth bag but a small press is better if it can be secured. Strain several times through a cloth bag. Standing for 12 hours before straining will settle some of the sediment. A slight cloudiness does not injure the flavor. Scald bottles and fill with the cleared juice to within 1½ inches of the mouth. Close with corks which have been boiled in water for ten minutes and tie down corks with string. Ordinary preserving jars may also be used. Seal the jars after filling. Place the bottles on their sides or corks down in a boiler with enough water to cover them. A screen at the bottom of the boiler will prevent breaking. Heat the water to 180 degrees Fahrenheit and keep at this temperature for 15 minutes. Higher or longer heating injures the flavor. Remove the bottles, stand on end, dry the corks with a towel and when nearly cold dip the ends of the necks of the bottles into melted paraffin. Store upright in a cool place.

### Spanish Tomato Sauce, Canned Pimientos

Will you kindly publish a recipe in the Cultivator for making Spanish tomato sauce as near as possible like what you buy in the cans on the market; also the canned red pimiento peppers that you buy on the market.—Subscriber, Glenn.

Spanish Sauce—1 red pepper, 1 green pepper, clove garlic, 1 onion; chop all fine and cook together in butter or olive oil, 10 minutes. Strain off liquor from quart can tomatoes, mix smoothly into this a tablespoon flour, add to above and cook 15 minutes longer, adding salt to taste, 1 teaspoon Worcestershire and ½ teaspoon celery salt. Stir constantly while cooking to keep it smooth.

Canned Pimientos—Use only perfectly sound peppers. To remove seeds cut around stem of each with slender paring knife and remove inside portions. To peel place in hot oven from six to ten minutes until skin blisters and cracks, watching carefully to see that they do not burn. Remove skin with slender paring knife. Flatten peppers and pack in horizontal layers in jars, adding no salt nor water. Put on top, place in waterbath (home made canner of wash boiler or kettle.) Bring water to boiling point in canner, boil 20 minutes for pints, 30 minutes for quarts. Irregular or broken peppers may be cut in strips or chopped and canned in same way.

### Drying Prunes

Will you kindly tell me if there is a satisfactory way of drying prunes in this vicinity in a small way for home use. Would like to be able to dry some without sulphur if it can be done. Have a very sweet small prune and do not know how to go about drying them. If there is any way please send me the information.—Subscriber, Anaheim.

Prunes are placed in a wire basket and dipped for a few seconds in a solution of lye (one pound to 30 gallons of water), held at the boiling point. Shake basket sharply so fruits will shift position and be wet on all sides. Dipping the prunes causes a slight checking or cracking of the skin near the stem end, which facilitates drying. If the lye is too strong or immersion too long, the skin may peel off. After dipping, the prunes are spread in a single layer upon trays and dried in the sun. They may dry unevenly. In the cool of the day the properly dried fruits may be removed. Prunes are dry when they are leathery to the touch, but not hard enough to rattle against the tray. When too dry they may be dipped momentarily into boiling water and piled in bins or on a clean floor while still damp. The moisture is soon equalized. It is well to turn them over a few times.

### Fruit Cocktail

Please print recipe for making fruit cocktail such as you get at soda fountains.—Subscriber, Fontana.

Any pleasing combination of fresh fruits in season with canned pineapple, peach, etc. One sampled at a fountain yesterday was made of cubes of fresh peaches, pineapple and a little apple, with a small amount of pineapple juice added and a little grapefruit juice to give a bit of tang, no sugar. Topped with spoonful of whipped cream and Maraschino cherry. Ordinarily banana is added; pineapple, banana and peach being a favorite combination. Often candied cherries or Maraschinos are cut and mixed with other fruits.

### "CALIFORNIA HOUSE" IN ARMENIA

"California House," a stone building which houses one of the largest boys' schools in Armenia, was dedicated near Alexandropol, Armenia, recently. This building is one of 65 buildings, formerly a Czarist army barracks, which make up the "orphan city" of Polygon, a suburb of Alexandropol.

The entire group, constituting the largest boys' orphanage in the world, is supported by Near East Relief. More than 5,000 Armenian boys are being brought up and educated at Polygon. California House includes principally boys of 6 to 10 years, representing the first to fourth grades. At the dedicatory exercises, the state of California was represented by E. W. Rankin of Monrovia and L. Ray Ogden of Oakland. Mr. Rankin is the general director of the Near East Relief work at Polygon; Mr. Ogden is the superintendent of the Industrial Schools, where all the boys are being taught trades which will make them self supporting at the age of about 16. Alexandropol formerly was the greatest southern military outpost of the Old Russian Empire.

## HINTS FROM HOUSEKEEPERS

A reader at Escondido sends to the office name of another grocer having chain of stores, who handles pectin for jelly making. She says she has found it fine. This commercial pectin was first referred to in Mr. Christie's article on jelly making which appeared in the Cultivator of June 17.

### Canning String Beans—Easy Cucumber Pickles

I am sending in a recipe for canning string beans, also recipe for making cucumber pickles. Both are easy. I have used this method for several years with very good success.

For beans, use fresh beans cut into short lengths, wash well, pack in jars, then fill with cold water. Put on the rubber jar rings and covers lightly. Leave on until contents are to be used. Place jars in boiler on laths, with cold water nearly to top, carefully adding hot water as it boils away. Bring all to boiling. From this time boil for three hours steadily. Lift a jar out at a time, fasten down caps without ever taking off. Keep the rest boiling until the last jar is out. Use for boiler a honey can which holds seven quarts, with one side cut loose. This serves as cover.

For Pickles—Use small cucumbers, wash well, pack in jars. For each quart put in one tablespoon salt, then fill with vinegar. Place caps on. Will be ready to use in a month. Sugar and spices may be added.—Mrs. Hector, Zelzah.

### Patching Overalls—Hanging Over-Drapes

Here are two hints for household department:

Overalls.—When patching overalls do not put patches over each hole, but take the full length of the back of an old pair, turn it wrong side out, and stitch it down the front of the good ones. Be sure and baste it first, turning it neatly on the pockets and down the front. When stitched, cut out the old cloth. They look like new.

Drapes.—When hanging drapes, it is not necessary to have double rods. Take old fashioned curtain pins and pin them to the material so they won't show through. Hook on to the rod, over lace curtains.—Mrs. R. H. Simonds, Orland.

### Renewing Brussels Carpet—Keeping Butter

The subscriber at Rohnerville can make her Brussels carpets like new by cleaning them with soap and warm water while they are stretched on the floor. Don't make too wet. Let dry, then take the water colors the children use in school and paint the colors of the carpet and it will look like new. Some hotel men pay a woman to brighten their rugs and carpets in this way.

If "Subscriber, Lodi," will put a teaspoon sugar and a little saltpeter in her butter when she packs it, it will keep sweet, but first of all, my mother, who is 80, says to work it and salt it, set it away until the next day or even the next, then put in the sugar and saltpeter, about as much as will lie on the point of a knife, or a small pinch with your fingers to about three pounds of butter; work it well and pour off all the water that comes out when you work it. She says that is what keeps it. Then put a clean cloth over it and put a layer of salt on top—and Mother knows; she was raised and lived on a farm in Pennsylvania and they are noted for their good butter. They get the highest prices for their butter.—Subscriber, Anaheim.

# Frequent Picking of Canning Fruits Means Larger Profit to Growers

By S. W. Cunningham, Secretary, Southern California Canners Bureau

As a result of the concerted campaign of demonstrations and publicity on thinning deciduous fruits, carried on during the past few months by the agricultural extension service of the University of California, in conjunction with our organization, it is now apparent that a better average job of thinning peaches has been accomplished this year than ever before in Southern California.

Some growers, however, were negligent in their duty toward themselves and the industry in this matter and are now having trouble in disposing of their crops because the fruit will not size up properly for canning purposes. The crop for the whole state will run into tonnage figures never before reached and the natural result is that canners choose the better fruit first. It is hoped that next year proper thinning can be more uniformly accomplished in the orchards.

### Picking Method Now Important

Growers who have made a sincere effort to thin properly, and other growers as well, should now give serious consideration to the matter of picking the fruit in a manner that will produce the highest results possible, both as to quality and tonnage. It is perfectly possible for a grower who has done an excellent job of thinning to lose a large part of the benefits that should result by doing a poor job of picking.

It would, of course, be a most desirable situation if all the peaches on a tree would ripen at the same time. If such were the case the whole crop could be taken off at one picking and picking would be a simple matter. However, peaches do not ripen that way and therefore, more than one picking is necessary. The question that now arises is: What are the benefits to the grower of making several pickings and how many and how frequent pickings should be made to secure the greatest benefits? A grower who picks his orchard over often enough to get off a high percentage of fruit at just the proper stage of ripeness for market gets the following benefits: High tonnage. Uniform quality both as to ripeness and size. Top market price on account of quality and size. Surety of market every year on account of becoming known as a consistent producer of uniform size and quality.

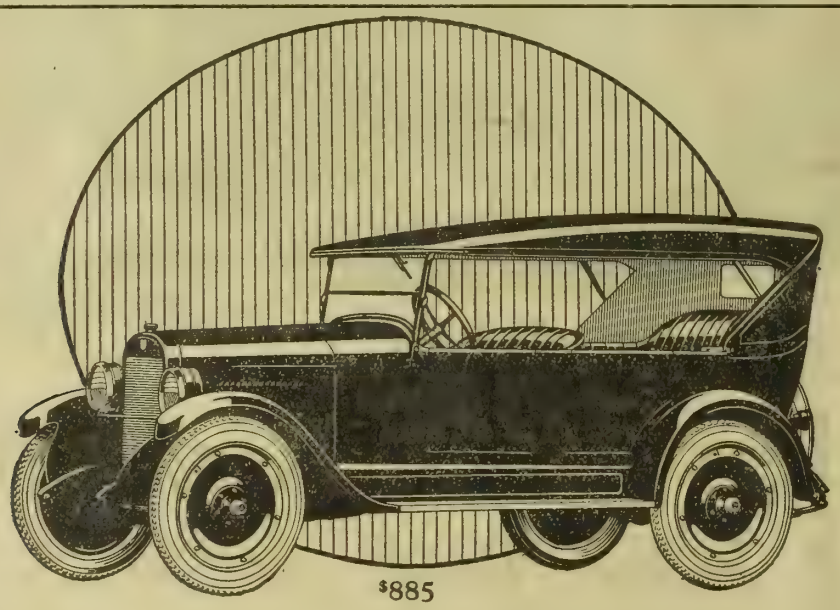
Higher tonnage is produced by frequent pickings as against less frequent pickings because, first: When picked often, practically all the fruit taken at each picking is very close to the exact point of ripeness desired and therefore, heavier than if some of it had to be picked three or four days ahead of that point so it would not be too ripe before the next picking. Second: By taking off all fruit just as it reaches the "Ripe but firm" stage, which is the stage at which it is most desirable for canning, the fruit left on the tree gains better size because some of the strain has been taken off the tree.

Growers who make four or five pickings of peaches deliver to the canneries a much more uniform quality and size of fruit than those who make only two or three pickings. The former catches nearly every peach at the proper "ripe but firm" stage and that means the period in that peach's life when it is full size and weight and well rounded out. On the other hand, the man who makes only two pickings has to take off many peaches that have not fully developed to the "ripe but firm" stage and therefore are under the full weight they would reach at that stage. He has to take them off because if left to the second picking they would be overripe for canning. He also gets many over-ripe peaches when pickings are a considerable time apart and this is not desirable. While the loss in weight for each peach picked ahead of the "ripe but firm" stage may be only an ounce or even a fraction thereof, it mounts up to a considerable figure on the whole crop.

Taking the picking proposition as a whole, the interests of the grower and canner are identical, just as in thinning. The canner would like to receive every peach at the "ripe but firm" stage and if the grower could pick them all at that stage by frequent pickings, he would get better tonnage, higher and more uniform quality, make a more satisfied customer of his canner and assure himself of a market for his crop every year because of recognition as a producer of uniformly good fruit.

One of the main reasons why Northern California canners can put 70 per cent or more of their pack into the high syrup grades of fruit is because their growers have discovered the benefits of frequent pickings by experience and consistently go over their trees four or five times each harvest season and thus get a larger percentage of the fruit to their canners at just the proper stage of ripeness for canning, than is the case in Southern California.

It is plainly impossible for any canner to make a high quality canned product out of low quality raw product, nor can the canner pay the much increased prices being paid to growers this year and come out at the end of the season with a profit unless the fruit comes to the cannery in sufficiently good condition to make a considerable percentage of high grades.



$885

Outstanding in beauty, outstanding in the rugged reliability which is the farmer's first need in his motor car.

# JOHNSTON TURBINE CENTRIFUGAL PUMPS

Installations can be made in wells 8 inch or larger. Produce 100 to 4,000 gallons per minute. Ask for Folder No. 4. Johnston Pump Company, 407 E. 3rd St., Los Angeles.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

### GRAFTED ORANGES AND FROST RESISTANCE

This letter from Mr. Weidenmueller will no doubt be of interest to those who contemplate experiments with reference to the frost resistance of grafted citrus trees:

I've just been reading the lucid account your Mississippi subscriber has favored us with, of grafted orange trees successfully resisting freezing temperatures of 18 or 19 degrees, to which trees of same age and kind and under similar conditions of culture, but budded, succumbed. It is, to say the least, a remarkable, a baffling phenomenon. It is my very humble opinion, that the greater vigor, hence greater power of resistance, of the grafted trees is attributable to the fact of the union between bud and stock being in close proximity to the "seat of vitality" in the plant, which is the crown at the surface of the ground where the osmotic force is the greatest in the plant. The farther removed from this seat of vitality the bud is the less potent is its viability, (that's an axiom in nature) and its equivalent power of resistance to antagonistic environs. I am not so presumptous as to offer this as an explanation at all, but assuming the correctness of the described phenomenon and knowing there can be no kind of result without corresponding causation, it is the only opinion I, a layman, can arrive at. I, for one, would like to see this mystery solved! For there is a solution and of it we are unconscious!—F. R. Weidenmueller, Upland.

### SUNBURN CAUSES MELAXUMA

Walnut trees affected with melaxuma were found where the disease is on the sunny side only. More than one-half the trees in a nine year old orchard were in serious condition. The trunks have never been whitewashed and there remains no question but the fungus first found entrance through sunburns. It had been progressing for at least three years. A coat of whitewash renewed once a year until trees shaded their own trunks would probably have been sufficient protection. Now at least one-half the trees will have to be cleaned of the affected bark and Bordeaux paste applied and still the trees must be whitewashed. Literally an hour at the right time would have saved nine.

### WALNUT GROWERS' FIELD DAY

Under the joint auspices of the farm bureaus and extension service of the walnut producing counties of Southern California, walnut growers from all Southern California will assemble at Santa Barbara on Saturday, September 2, on the occasion of the Second Annual Walnut Growers' Field Day. A program contributed to by the leading experts in all phases of the walnut industry has been prepared by the committee in charge, which is expected to result in drawing together the largest crowd of walnut growers ever assembled in the history of the industry. An additional attraction will be an old fashioned Spanish barbecue provided by the Santa Barbara County farm bureau and Santa Barbara County Walnut Growers' Association. Plans are being made to feed and entertain 1000 people. Special hotel rates have been secured by the local committee, and the Santa Barbara Chamber of Commerce will act as host on Friday, September 1, to show the visitors the beauties of Santa Barbara County.

For the convenience of the committee, walnut growers expecting to attend the Field Day and desiring hotel accommodations or expecting to be present at the barbecue are asked to write to the secretary of the Santa Barbara Chamber of Commerce.

**The Program**

10 a. m.—Address of Welcome, E. W. Stowe, Goleta. Walnut Growers' Departments, their Growth and Accomplishments—Robert W. Hodgson, farm advisor Los Angeles County. The 1922 Season's Outlook—W. T. Webber, sales manager, California Walnut Growers Association. New Developments in the Cooperative Movement—C. C. Teague, president Walnut Growers Association, or George E. Farrand, agricultural legislative committee.

1:30 p. m.—Field Trip. Up-to-date Information on Pest Control by Dusting—Prof. R. E. Smith, college of agriculture. Soil Moisture Demonstration—Prof. J. W. Nelson, college of agriculture. The Necessity of Better Harvesting and Curing Methods—H. C. Sharp, field department, California Walnut Growers' Association. Performance of Walnut Varieties—E. S. Kellogg, horticultural commissioner, Santa Barbara County.

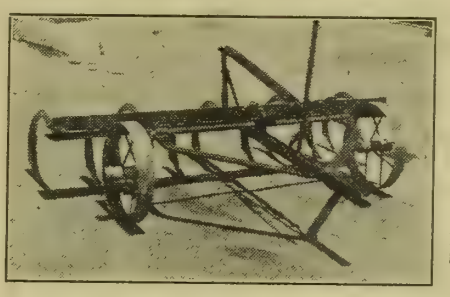
HURLEYS NEW **GOOSE NECK Cultivator**

The Best Furrowing and Leveling Machine on the Market—
Built for Horses, also Largest and Smallest Tractors.



This is the lightest weight efficient Cultivator and Furrower on the market. Its construction of spring steel gives it a crossbar that yields to sudden strains and it springs back. Detach the shovels and wheels and you have THE BEST LEVELER YOU CAN BUY.

Patented reinforced spring steel drawbar 5 in. x ⅜ in. with bar below 5 in. x ⅜ in. reinforced on two edges with angle iron. Shanks diamond shape 1¼ or 1⅛ in. Hitches for all tractors or horses. 6 ft. size only $110 with 1¼ in. shanks. 6 ft. with 1⅛ in. shanks $105. Made in 6, 7 and 8 ft sizes. Horse drawn cultivator has front truck. Over 300 in use and all giving best of satisfaction. Order direct.

You can go any depth from 5 in. above the ground to 15 in. deep, setting the teeth to prevent cutting the roots.

**ONE OF ORANGE COUNTY'S PROMINENT CITRUS GROWERS WRITES:**

M. H. Hurley, Whittier. Anaheim, July 18, 1922.

I want to express my appreciation of the work done by your Gooseneck Cultivator. I had a crusty soil condition in one part of my grove that other cultivators would not handle but your Gooseneck Cultivator went right into it, ripped it up and all the ground now permits water to enter easily, gives air to the roots and the trees that were showing signs of touble before are healthy and doing fine. It was the cultivating that did it.

ADOLPH MOSS.

## MAXWELL FARMS HERD

## 120 REGISTERED HOLSTEINS 120

### Hollywood, Calif., August 30-31, 1922

This is positively the greatest offering of high record Ormsbys ever made in the entire west, and with their great pedigrees they carry splendid average type and physical condition throughout the herd. Look at this list of groups in the sale:

DAUGHTERS OF KING SEGIS PONTIAC, headed by the famous 37 lb. 3 year old K S P Lily McKinley, that also made 1,199 lbs. butter in 365 days.

DAUGHTERS OF SIR ORMSBY SKYLARK, sire of the noted world's yearly record butter producer, Duchess Skylark Ormsby.

DAUGHTERS OF KING PIETERTJE ORMSBY PIEBE, including his highest record daughter, a 34 lb. 4 year old.

DAUGHTERS OF TRITOMIA PIETERTJE ORMSBY, the National Grand Champion.

DAUGHTERS OF SIR SKYLARK ORMSBY HENGERVELD, the famous sire of Gerben Abbekerk Maid.

DAUGHTERS OF KING PONTIAC NETHERLAND SEGIS 3D, the great proven son of Gerben Abbekerk Maid.

DAUGHTERS OF MAJOR ORMSBY PIETERTJE, headed by a 20 lb. junior 2 year old.

### THESE GREAT BULLS WILL SELL

MAJOR PIETERTJE ORMSBY, a son of Sir Pietertje Ormsby Mercedes and a 1,000 lb. granddaughter of Spring Brook Bess Burke 2nd. Here is an unusually high class son of the great Sir Piet., and he has every right to command one of California's top prices.

SIR ORMSBY SKYLARK PIETERTJE, a son of Sir Ormsby Skylark and a 33 lb. daughter of Sir Pietertje Ormsby Mercedes that made 1,160 lbs. butter in one year, second dam a 30 lb. daughter of Canary Mercedes Paul that made 907 lbs. butter in one year.

A WONDERFUL SELECTION OF HIGH RECORD YOUNG BULLS, the largest list of sons of 30 lb. or 1,000 lb. dams that has yet been offered in a California sale.

**Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer. NOT A SINGLE REACTOR WAS FOUND IN TESTING THE HERD FOR THIS SALE.**

TERMS OF SALE: California Breeders Sales and Pedigree Co. will extend the usual terms of one-third cash, balance in three, six, and nine months to responsible parties who arrange for credit prior to sale.

PLACE OF SALE: Maxwell Farms, about 4 miles north of Hollywood on Ventura-Calabasas Road. Headquarters for out of town buyers will be Angelus Hotel, Fourth and Spring Streets, Los Angeles

# How the Show Ring Helps the Livestock Industry

**By E. A. Stuart, President, Pacific International Livestock Exposition**

FOR a good many years the American farmers and breeders of livestock have, in in their various communities, met at some given place for the purpose of comparing the products and animals raised on their farms with those produced by their neighbor.

Some grand old philosopher has said "Things are, only in comparison to others." Thus, to show improvement in propagating, whether it be farm products or livestock, it has always been proven that an upward trend toward betterment and efficiency comes only by comparison.

If you ask a breeder who is a consistent showman why he follows the circuit year after year, he will tell you that he finds exhibiting at fairs and shows the greatest source of publicity he can possibly use. He secures more sales, immediate and prospective, through exhibiting at these places than through almost any other medium. At fairs and shows he meets others in the business, and when he has something really worth their attention he can establish a market.

It is a breeder's post graduate course. A man who cannot learn a great deal during and following a competition should not be a breeder. The best of breeders are quite frequently the humblest. Those who win consistently are the first to say that they learn many pointers at such gatherings.

The opportunity to study your own production as compared with others is not the only benefit gained by showing. There is no place better adapted for buying and selling. You may find next to you the very sire you need to build up a second generation. If you can't get him you may negotiate with the owner for some of that blood and style. The best are all there.

There are men who raise domesticated animals and yet who have no pride in them. But I have yet to find a man who fits animals for fair, show or sale who does not increase his pride in them. It is a right and worthy pride, pride which advances the cause of good livestock.

A majority of exhibitors do not make their expenses out of premium money, nor is it to be expected. But premium money helps pay the expenses and the other advantages are so great that no breeder who pretends to a superior quality of livestock should hesitate about the cost.

The awarding of premiums is a constant source of surprise to the uninitiated. Those who are not familiar with the results are inclined to believe that nobody has much of a chance but the largest and wealthiest breeders. At the Pacific International Livestock Exposition last year about 3500 head of purebred dairy cattle, beef cattle, heavy horses, sheep, goats and swine, many of them blue ribbon winners at other great fairs and shows, were gathered together. The grand champion Jersey bull came from a small farm and was owned by a man who had never exhibited outside his own county. He was pitted against animals of same breed from several states known for show quality.

I know of another man who, on the first occasion he ever showed at Portland, won the grand championship on his Holstein cow which he valued at only a few hundred dollars. After the show he sold her at public auction for $2100 and the purchaser later sold her for $5,000 and her heifer calf for $2,800.

The constructive breeder of standing who has won a place for himself in the country is the first to give his showring experience great credit for raising the standard of his herd. The small breeder therefore should not hesitate to show at his county fair and state fair, as it will mean the raising of standard in type which in the end will mean increased production in individual herds. If only ten herds per year per state are thus improved, it would not take many years to raise the standard of our livestock breeds to the point of at least 25 per cent greater production and profit.

# Advertising the Purebred Herd

**By Prof. E. H. Hughes**

IF the buying and producing of livestock were the only problem which presented itself to the average livestock producer his task would be a comparatively simple one. The production of livestock includes buying, growing, breeding and feeding of animals. The successful producer is in addition a successful advertiser. We find our large manufacturing concerns employing highly trained advertising men. These men are responsible for developing new trade and for selling the manufactured article. The selling of surplus livestock is as big a problem as the problem of production.

### Advertising is Done in Various Ways

We hear considerable these days about trade names, and practically all the pure bred producers in this and other states have their own farm names which soon become a part of their regular advertising scheme. Some of these men use their farm name as a part of the registration names for their animals. As an example, one that is familiar with Shorthorn cattle recognizes the name of Anoka Sultan as the name of a Shorthorn bull that was bred at Anoka Farms in Wisconsin, and the proprietor is Frank W. Harding. Many examples of this sort can be mentioned in our own state. The reputation of the farm itself becomes sooner or later one of the best advertising methods, depending of course upon the class of livestock produced—the methods of dealing with the buyer and the goodwill created by the owner in his breeding and dealings generally. The buying public soon learns that certain farms stand back of their products, and this surely becomes an important factor in the advertising and selling of the products of this particular farm.

Advertising is not something definite that can be measured by any material methods, therefore, means of investigating the efficiency of various forms of advertising usually pay large dividends. This can be done by keeping accurate records of the results of various advertising methods.

There are several specific kinds of advertising, namely; the farm sign located near the entrance of one's ranch, signs at crossroads, better advertising in our trade livestock journals, exhibits at county and state fairs, association sales, aiding in the developing of pig and calf clubs, personal and form letters, pamphlets, photographs and many other forms of general publicity work by the owner himself. Many times loaning of pure bred sires to neighbors becomes an important means of local selling.

The George Junior Republic at Chino in showing at the state fair last year won prizes of which any firm would be proud. This fact has created new interest among the boys at this particular institution. It has advertised their products in more ways than one.

### Advertising Percherons

Another example of the value of winning prizes is that of the Percheron stallion, Carnot, that was purchased by W. S. Corsa in the fall of 1909 for $10,000. This stallion won the grand championship at the Chicago International that year. At the time this price was considered an outrageous one and many people felt that Mr. Corsa used poor judgment. However, this stallion has become famous as a sire, and colts sired by him have won the get of sire classes in practically all the shows in recent years. In 1913 Mr. Corsa made a statement

that he had already sold more than $13,000 worth of colts sired by Carnot and that he had as many of the colts on the farm sired by him as he had already sold. In addition he had Carnot left. A few years later he sold a half interest in this horse for $20,000. It is impossible to estimate the amount of advertising Mr. Corsa got from purchasing this stallion and mating him to the right kind of mares. Mr. Corsa has always kept before the public the name and number of this well known horse. This is merely one example of many which goes to prove that it takes advertising to put a thing across.

### Selling by Mail

Many men are able to sell their stock by mail. The best known example of this method of selling is that of the S. M. S. Ranch at Stamford, Texas. The late Frank S. Hastings developed this method of selling to a very high degree of efficiency. The S. M. S. standard feeder cattle are known as far east as Maryland, as far west as California, as far south as Texas, and as far north as Michigan.

One of the best aids to selling is prompt answering of all inquiries; using proper kinds of stationery; making affirmative rather than negative statements when one has something to sell. The right sort of equipment often has a psychological effect upon the buyer. If one intending to buy goes to a farm where things are kept up in excellent shape; where the gates hang on good hinges; where the corrals are clean; he is more apt to buy than if he goes to a place where dust is in evidence and where there is little regard for order.

### Farm Papers

One of the important forms of advertising is through the use of our agricultural press. In selecting a paper to advertise in, the reliability, reputation and the circulation of this particular paper are important considerations. It has been found as far as results are concerned that some advertising is cheaper at $4 a line than at $4 a page, depending, of course, upon the attractiveness of the advertisement; the paper itself and where the advertising is located. Some essentials of a good advertisement are that it attract attention, make an impression upon the reader, induce him to buy and lead to a response. A proper heading to an advertisement is most important because from it the reader gets his first impression. The size, shape, margin and position of an advertisement all affect results. In writing an advertisement some expression that associates it with your products adds greatly. Who is it that does not associate "eventually, why not now" with a prominent milling company?

The subject of advertising is a big one. In statements appearing in this article are only a few suggestions that might call to mind some of the things to take into account in placing before the buying public livestock that one has to sell.

## PREMIUM LISTS FOR DAIRY PRODUCTS

The state fair premium lists for dairy products are available and are being distributed by Dr. C. L. Roadhouse of the university farm at Davis. The prizes offered are extremely attractive and should induce entry of a large number of competitors.

A class is provided in which dairy inspectors may enter. Awards in this exhibit are based on the five highest scoring samples of milk and cream produced under the jurisdiction of the inspector. All employes of the division of animal industry are urged to cooperate with Dr. Roadhouse and the state agricultural society in making this part of the fair a pronounced success.

## THE TARIFF ON WOOL

**By J. F. Wilson, University of California**

Many newspapers throughout the country are publishing propaganda to the effect that the proposed tariff of 33 cents per scoured pound on wool imported into the United States will work an untold hardship on the wearers of wool clothing. So successful have the manufacturers and clothiers been in disseminating this propaganda that at least one large San Francisco daily published as "news" a statement that "the proposed rates will add at least $2.50 to the cost of every woolen suit of clothes, $3.50 to the cost of an ordinary overcoat, and $5.00 to the cost of a heavy ulster." Another daily, this one from New York City, dispenses with all introductory remarks by boldly stating: "The actual reason why 107,000,000 pounds of wool is being held in bond (in different ports of entry in the United States) is because of the 'joker' in the emergency tariff law, which levies a double duty on 'skirted' wool, and thereby puts a virtual embargo on all importations."

The public, it is to be hoped, will not be led astray by such plain misstatements of fact.

The United States was once a wool exporting country. Today we import more than half the wool we consume. While the population has increased enormously, our flocks of sheep have dwindled 12 million head in the last ten years. The decrease has been due to one factor; they have not been profitable. A tariff is necessary for the protection of the industry. It is better to have the tariff, make wool growing profitable, and slightly increase the cost of our clothes than to see the industry wiped out and later pay a much higher sum for clothes imported from a foreign country or made entirely from foreign grown wool.

If a fellow thinks he is in a hole, nine times out of ten he is simply in a rut.

# REMCO TANKS

We will ship immediately on receipt of order, any Remco tank, dimensions or capacities shown below, at prices listed:

### EXTORTIONATE MEAT MARGINS

(Continued from Page 173.)

The man who sold the 4 to 5 cent bunch is struggling along in the Newhall mountains trying to earn a living. He knows cattle as he is an authorized agent of the state in cattle inspection. He has no particular enemies and was under no black list or prejudice, and that was the best he could draw, less by $9.44 per head than open offers for northern Arizona feeders on a delivered California basis. Is that the way these Los Angeles killers build up the home livestock supply? Is there understanding and coalition? If the chamber of commerce desired to buld up livestock production around Los Angeles it can well look into matters of this nature, for such methods are killing off the livestock supply. If there are any laws that prevent price coalition such a condition should interest federal authorities if it exists.

This cattle seller went to many packing houses. Some asked him, are your cattle heavy or light? He answered "Medium." Some asked if they were heavy and he said "No." They said all they wanted was heavy cattle. Others asked if they were light, and he said "No," and they stated all they wanted was light cattle. Suspicious, he repeated on one well known firm. The first trip they told him they wanted heavy and the next light, or exactly opposite each time what he stated he had, and then he blew up with wrath, asked their game and charged them with being crook buyers.

Remember while all this is going on there is one bunch that expects to get 8 cents and will get seven fifty or better, owned by a large man.

We thought such prices and practices things of the past, that a new deal had come, etc., but, Mr. Farmer and Mr. Consumer, these people haven't yet seen the light. The politicians did not see it until after their machines began smashing this year, for the people are handing out their displeasure with votes. Party lines make no difference, for what people want is a lower cost of living and taxes and better economic distribution, and their political servants who have not bestirred themselves are getting the ax.

The second part of all this is, what are the packers getting for these five cent steers and four cent cows? Irrespective of the meat lists, which are bunk for the easy buyers, the competitive carcass steer beef price is 12½ to 13 cents and for cows from 10 to 11½.

Those steers dressed 500 pounds of meat, which even at 12 cents brings $60. The hide is worth $3 to $4, and offal edibles as much. Anyone will kill for $1.50 per head, blood and waste offal. There is on a bargain basis $64.50 from a $47.20 steer, $17.30, or, outside of selling and delivery, the killer figures more than 35 per cent on the producer price.

Let us see what happens when the same steer sells for 13 cents? The meat brings $65 and hide and edible offal at least $7 more, or a total of $72 gross on a $47.20 steer, or $24.80 per steer. Do you wonder why I for one have no confidence in any independent killing bringing better producer prices, when a thing like this occurs where the big bulk of the kill is independent?

What is happening in cattle is happening in lambs and hogs. I have seen bills on lambs from 27 to 30 cents for carcass. On a 70 pound lamb that costs about $7 (some are being bought at $5 to $6 per head f. o. b. range) there is a profiteering margin. The pelt is bringing over $1 now, and there is the edible offal that more than pays killing expense, but a 35 pound dressed lamb carcass at 30 cents is alone bringing $10.50 or $3.50 gross profit. Figuring on the high basis of $2 for pelt and edible offal it becomes a gross $5.50 on a lamb if bought at $7, or $6.50 on a lamb if bought at $6. More for the one phase of handling, that formerly should have been figured at 50 cents, than the producer gets out of that lamb. And even so $6 to $7 lambs make money. When the retailer gets through with his profits you know why you pay so much for meat. I may be accused of figuring these lamb profits too strong, but the seven dollar 70 pound lamb or 35 pound dressed at 27 cents figures $11.45 including $2 for pelt and edible offal, or the extortionate margin of $4.45 gross.

I don't know how many cattle are being bought on the 7 cent ranch basis as compared to the 5. I am only dealing in a fact. On the 4 cent cows that sell even at 10 cents the killing margin runs up to a $16 gross that should not be half, and which in producer abattoirs has been proven to cost $2.

What profit is there in 11 cent hogs and 30 cent pork? 75.25 per cent is what a hog dresses or roughly three-quarters of its live weight. A 200 pound hog is good for 150 pounds of pork. 150 pounds of pork at even 25 cents is $37.50 and 200 pounds of live hog at 11 cents is $22. $15.50 per hog is going some.

On such prices as 13 cent steer beef and 12 cent cow beef, 27 cent lambs and 25 cent-up pork, live weight prices under any standard that is familiar to us of margins in the past years, the live weight prices would be 7 to 8 cents on cattle, the price claimed as being paid to large producers, cows 6, lambs 14, and hogs 14.

The producer is being robbed and business is stagnant. The budding encouragement and interest in cattle is being nipped and destroyed in its tender blossom by existing piratical practice. How long will people put up with it?

### HARTSOOK AGAIN WINS SWEEPSTAKES

The annual report of the Los Angeles County cow testing association for the year 1921-22, which ended June 30, has just been issued.

It shows an average production of 8,857 pounds milk and 348.9 pounds butterfat produced by 2443 cows in the association. It also shows that the average production of all purebreds in the association was 11,234 pounds milk and 397.8 pounds butterfat as against an average production of all grades of 8,546 pounds milk and 342.5 pounds butterfat, which shows an increased production of 2,688 pounds milk and 55.3 pounds fat over that of the grades. This is certainly a good argument for purebred dairy cows. This report also shows that the production of all old members in the association was 353.6 pounds butterfat as against 312.2 pounds butterfat by the new members, which shows that the old members have been able to improve their production by using the association records.

This report embodies the winners of the yearly competition for the same period. Cows milked three or four times a day have a certain percentage deducted in order to place them on the same basis as the two timers, and are reported in pounds of butter fat allowed.

2. Adohr Stock Farm, credit 350.4.

The sweepstakes cup awarded to the dairyman winning the greatest number of points for monthly and yearly production was won for the second time by Fred Hartsook of Lankershim, with a total of 190 points. Eight herds had over 100 points each, but could not equal the production of Hartsook's great Holsteins.

---

One of the best known herds of Hereford breeding cows in the entire Southwest will be dispersed at the ranch of Ex-Governor W. R. Stubbs near Hereford, Texas, on Monday and Tuesday, September 11 and 12. This herd of 2800 head of cattle was started 35 years ago by Jeff Thompson in the use of registered Hereford cows and bulls. Nothing but the best females were used for replacement purposes, the balance finding their way into the feed lot to be converted into beef. In later years Ex-Governor Stubbs of Kansas purchased the entire herd, continuing the policy adopted by Mr. Thompson. From the records made in both the show yard and the feed lot this herd has established the enviable reputation of becoming one of the most noted breeding plants in Texas.

---

An old bachelor says that the difference between firmness and obstinacy is merely a matter of sex.

**ADMINISTRATRIX SALE**
30 Registered Jerseys
25 High Grade Jerseys
**HYNES, CALIF.**
(Rhoades & Rhoades Pavilion)
**Monday, August 28, at 10 A.M.**

Owing to the sudden death of W. H. Rough, Arlington, Mrs. Rough will make a complete dispersal of the splendid producing herd of registered and high grade Jerseys, at public auction.

Every Animal Over Six Months Old Tuberculin Tested and Sold Subject to Retest By the Buyer Except as Announced At Sale

Management
California Breeders Sales and Pedigree Company
C. L. Hughes, Sales Manager, Sacramento, Calif.
Auctioneers:
RHOADES & RHOADES, Los Angeles

# Famous Stubbs' Hereford Sale

The greatest event of the year in the cattle world will be the closing out public sale of Ex-Governor Stubbs' herd of full-blood, non-registered Herefords.

## September 11-12, at Stubbs' Ranch

Eighteen miles northwest of Hereford, Texas, only 40 miles southwest of Amarillo and 60 miles northeast of Clovis. Nearest railroad point, Hereford, Texas, on main line of Santa Fe.

## 2800 Purebred Non-Registered Herefords

This auction sale will dispose of 900 cows, 400 heifer calves, 375 bull calves, 300 yearling heifers, 250 two-year-old heifers and 60 registered Hereford bulls. In addition, the sale will include 200 two-year-old steers and 300 yearling steers of Stubbs quality.

**PRIZE-WINNING STOCK AT YOUR PRICE**

This herd had a foundation stock of wonderful registered cows. For 35 years the choicest blood strains in the Hereford world have been added by use of only registered herd bulls. The Stubbs cattle have quality to spare. They are great, rugged, heavy-boned, low-down beef producing animals in good condition and running uniform to the best Hereford type.

For many years the bull calves have been sold at prices ranging from $75.00 to $150.00 per head for range service. The bulls and heifers have been prize winners at the American Royal and have topped the Kansas City market for both weight and price for the day, month and year, and for all times previous to that date.

This sale will afford you stockmen the opportunity of a life-time to buy seed stock from a cow herd that has been more than a generation in the building. Remember, other men have spent a life-time breeding them for you. Cattle are scarce; good cattle are very scarce.

**ENTIRE HERD MUST BE SOLD SEPT. 11-12**

Sales will be made in car-lots. Terms, 12 months' time with 7% interest will be extended to parties furnishing approved security. Good railroad accommodations. There will be bargains for all who come. Don't fail to take advantage of this eventful offering. Will hold cattle for 30 or 60 days if purchaser desires. For more particulars, address

E. H. PUGSLEY, Sales Manager, 214 Commerce Bldg., Kansas City, Mo.

Auctioneers: Colonel Fred Reppert and Colonel P. M. Gross.

# Poultry Queries

Conducted by Jean A. Koethen

### Nux Vomica for Chickens

My reply to subscriber, St. Helena: —Nux vomica was an old time remedy with our grandmothers and great grandmothers, back east, for the extermination of hawks, but I never heard of it being used to free chickens of vermin. As our chickens had unlimited range we never knew what it was to have them bothered with vermin. Nux vomica was believed to be a good tonic for chickens. I do know it was a great appetite stimulator for them. The proportion is a heaping teaspoon of the powdered nux vomica mixed well into a half gallon dry mash and then moistened as usual, this to be repeated every second day as long as any hawks appear. No chickens are eaten by the family for ten days after the last dose of nux vomica is fed. It was the general belief that all fowls hatched with their eyes closed nux vomica would kill, but all hatched with their eyes open it would not harm. I do know we found hawks nests with the young dead.—Subscriber, San Bernardino.

### Droopy Tails

Two of my pullets walk with head erect and tail dragging, like penguins. One has been this way a month, the other I have just noticed.—Subscriber, Buena Park.

Dr. Salmon says: "When anything is the matter with a horse the maxim is, examine his feet; when anything is found wrong with poultry the maxim should be look for lice." It is possible there has been some injury, but much more likely that the birds are either covered with lice or preyed upon at night by myriads of mites. Midsummer is the time when mites do their most deadly work, and pullets that have their blood sucked night after night by these terrible pests lose their vitality if not their lives. Go over the houses thoroughly with an insecticide such as cresol, crude carbolic acid or carbolineum, and see that no crack or corner escapes.

### Poultry Books

Please give me a list of books on turkey and chicken raising.—Subscriber, Adelaide.

Harry R. Lewis' "Progressive Poultry Husbandry," published by Lippincott's Philadelphia, and Dryden's "Poultry Breeding and Management," published by Orange Judd & Co., New York, are two of the best texts on general poultry raising. A very good bulletin on turkey culture may be had free by writing the Department of Agriculture, Washington, D. C., and the extension department of the Rhode Island experiment station at Kingston, R. I., has published some excellent bulletins on prevention and treatment of blackhead in turkeys. There is no up to date book on turkey raising.

### Crazy Chickens

What ails chickens and turkeys when they seem to go blind and act as if they were crazy? After a little while they die.—Subscriber.

Unsteady walk, expansion of the pupils, slow and difficult breathing, trembling and convulsions are symptoms of arsenic poisoning, possibly from rat or gopher poison or some spraying mixture. There are also weeds which chickens on range sometimes find which produce similar symptoms. For arsenic poisoning white of egg, flaxseed mucilage, and large quantities of milk are the simplest remedies. Sulphate of iron and calcined magnesia are also used.

### Wheat for Pigeons

I have some pigeons six years old, and whenever the squabs are half grown they die. I feed them wheat all the time and the old pigeons get plenty of greens and have a good range to fly. This is the first summer I have lost any.—Subscriber, Manzanar.

Wheat as an exclusive diet is not good for either adult pigeons or squabs. They should have a variety of grains, with corn as the foundation. A mixture of ¼ wheat and ¾ corn, for the regular ration, with a good feeding three times a week of Canada peas, Kafir corn, hemp, millet, barley, or a mixture of two or three of these grains, will keep the birds in better condition than any one grain alone. See also that they have clean water, grit and rock salt. Too much wheat causes diarrhoea; absence of grit and salt produces the condition known as "going light."

### Swellhead in Turkeys

My turkeys have colds which seem to settle in their heads and form a swelling on each side of the nose, and cankers. I have been feeding bluestone and dipping their heads in it, but the disease is spreading, and many are dying.—Subscriber, Templeton.

If the disease is so general the first step toward a cure is to find the cause. Turkeys that roost out of doors are rarely troubled with roup or any sort of cold unless they have an inherited tendency to the disease. If yours are roosting indoors you will have trouble until you give them some sort of outdoor roosting place. The only roupy turkey I ever had I cured by dipping its head morning and night in a solution of potassium permanganate. Get ten cents worth of permanganate crystals from the drug store and drop into a quart measure or lard pail of slightly warm water just enough to make the water a deep pink. Before you dip the birds' heads you will have to open the swellings under the eyes and wash them first with a 20 per cent solution of baking soda, then with peroxide of hydrogen. After that you can dip the head twice a day, first massaging the nostril upward toward the eyes to loosen the mucus. Hold the head under while you count ten slowly. Another treatment which is recommended by Dr. Kaupp, after the swellings are opened and cleansed, is to inject with a small syringe or atomizer a mixture of 1 dram oil of thymol, 20 drops oil of eucalyptus and 2 ounces oil of petrol. This is done three times daily. If you use potassium permanganate prepare it fresh every time you use it.

### Picking the Layers

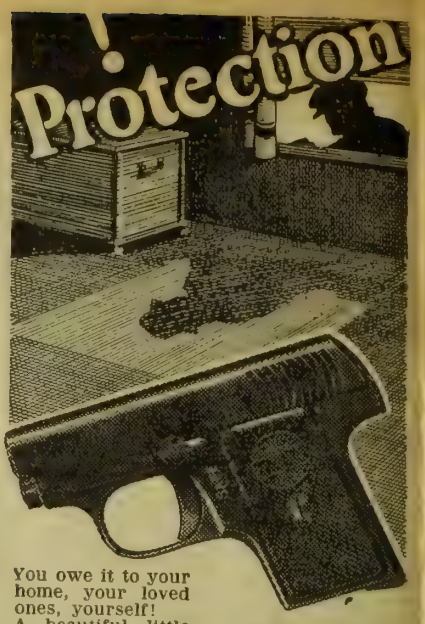
On June 26 I began to mark my sitting hens. Two hens released on that date began to sit on July 19. When killed both were fat, had a tinge of yellow on beak and shank, three finger abdominal capacity and pelvic bones a half inch thick. One had a large cluster of eggs, the other a very small one. Would the former have made a good layer, or is there any correlation between the number of undeveloped eggs and the future production of the hen?—Subscriber, Alhambra.

No Leghorn hen that goes broody twice in two months will ever be a good layer, no matter how many undeveloped eggs she contains. Those undeveloped eggs are the seeds, so to speak, which may grow into eggs, but no hen ever developes all of them. Those that are already developing when the hen is killed are all you know positively would ever have developed.

### Neighbor's Hens

My neighbor's chicken houses, which are built against the division fence, are unspeakably dirty and his chickens have developed roup. Can I compel him to cleau up? If I cannot, is there anything to prevent my hens from getting the disease? Is there any disinfectant to use in water or houses that will destroy the germ? The division fence is 8 feet high. Would it help if it were covered with burlap and the burlap sprayed with disinfectant?—Subscriber, Ontario.

If you are within the limits of an incorporated city you have to ask the health officer about making your neighbor clean up. Different towns have



You owe it to your home, your loved ones, yourself!

different regulations about such matters. As to your chickens catching roup from his, that is not at all likely if your yards are kept perfectly clean and sanitary and your houses well ventilated. Roup is not an infectious disease nor is it a summer disease. Hens that are affected with it in summer must be very badly treated indeed. If the division fence is a tight board fence (and I should make it so if it is not) painting it with a cresol preparation or with crude carbolic acid and kerosene, 1 part acid and 4 of kerosene, ought to keep out any kind of germ or insect, and I should be much more afraid of the latter. Mites, ticks and fleas are almost certain to find their way through if he has them unless you keep every crack soaked with insecticides.

## STORRS EGG LAYING CONTEST

Storrs, Connecticut, August 1, 1922. Report for week ending July 31.—The birds for the thirty-ninth week produced 3648 eggs, or a yield of a little better than 52 per cent. This was 122 eggs more than last week, 162 eggs more than last year for the same period and 97 eggs more than the seven year average.

The four prizes for the week were distributed among the Leghorns and the Barred Plymouth Rocks. A pen of White Leghorns owned by Hollywood Farm, Hollywood, Washington, was an easy first with a score of 60 eggs.

The four leading pens in each of the principal breeds are:

**Plymouth Rocks**

Harry G. Culver (Barred), 1647; W. H. B. Kent (Barred), 1584; Ontario Agricultural College (Barred), 1514; Purdue University (Barred), 1484.

**White Wyandottes**

Frank P. Matteson, 1720; Woodbridge Orchards, 1684; Walter Bradbury, 1569; Clemens J. Diemand, 1466.

**Rhode Island Reds**

The Orchards, 1531; John Z. Labelle, 1514; Charles D. Pierce, 1437; F. S. Chapin, 1397.

**White Leghorns**

Hollywood Farm, 1625; J. Frank Dubois, 1564; Goshen Poultry Club, 1546; Andrew L. Ohr, 1486.

## ELEVENTH NATIONAL EGG LAYING CONTEST

The 300 hens in the Eleventh National Egg Laying Contest at Mountain Grove, Missouri, laid 5,154 eggs during the month of July or an average of 17.18 eggs per hen. Pen No. 5, S. C. Anconas, owned by Frank Van Bree, Zeeland, Michigan,, won the cup for July by laying 126 eggs during the month.

Number of eggs laid by the different breeds for the month and to date are: Plymouth Rocks, 894, 8,241; Wyandottes, 868, 8,227; Leghorns, 905, 8,139; Miscellaneous varieties, 826, 7,945; Anconas, 971, 7,904; Rhode Island Reds, 690, 7,047.

Ten leading pens for July are: S. C. Anconas, Michigan, 126; S. C. White Leghorns, Washington, 125; S. C. White Leghorns, New Jersey, 118; S. C. Anconas, Missouri, 112; R. C. Rhode Island Whites, Missouri, 111; Barred Rocks, Nebraska, 111; R. C. Rhode Island Whites, Illinois, 110; S. C. White Leghorns, Missouri, 109; White Wyandottes, England, 108; Barred Rocks, Missouri, 106; White Wyandottes, England, 106.

Ten leading pens to date are: S. C. White Leghorns, Washington, 1,013; White Wyandottes, England, 993; White Wyandottes, England, 983; Barred Rocks, Missouri, 952; R. C. Rhode Island Whites, Missouri, 951; S. C. White Leghorns, England, 934; Barred Rocks, New Jersey, 923; R. C. Rhode Island Whites, Missouri, 909; Barred Rocks, Missouri, 900; S. C. White Leghorns, Missouri, 898.

## CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The tenth month of the California Farm Bureau Egg Laying Contest at Santa Cruz closed with a monthly production of 58 per cent, or an average lay of 18 eggs per hen. The average production for the ten months was 52 per cent. every day since the first of last October. This production has been obtained with a simple, inexpensive ration and recognized standard methods of flock management, and 79 per cent of the July egg yield graded as extras. The hens consumed 3.36 pounds dry mash (no moist mash is fed at this season) and 3.19 pounds grain. The grain cost $.0606 at $1.90 per 100 pounds and the mash $.0766 at $2.28 per 100 pounds. The total feed cost per hen for the month was $1.37. Detailed information on the methods of feeding and flock management employed at this contest, together with the printed rules and regulations for the next contest, which begins October 1, 1922, will be gladly sent upon request to the County Agent, 4 Cooper Street, Santa Cruz, or the Poultry Division, University Farm, Davis.

**High Pens to Date**

Alex Stewart, Santa Cruz, 2225 1/3; J. A. Hanson, Corvallis, Oregon, 2098 1/3; J. J. Shore, Santa Cruz, 1997; C. H. Russell, 1897⅔; H. H. Corbett, Santa Cruz, 1895; L. A. Thornewill, Santa Cruz, 1892; D. B. Walls, Petaluma, 1887 1/3; Sunrise Poultry Farm, Santa Cruz, 1841; Hollywood Poultry Farm, Hollywood, Washington, 1828 1/3; Boehm & Noel, Hayward, 1815 1/3.

**High Pens for July**

Hanson, 251; Stewart, 250; L. A. Thornewill, Santa Cruz, 244 1/3; Pacific Trapnest Station, Windsor, 240; Geo. Gray, Santa Cruz, 237 1/3; Hollywood, 235; Boehm & Noel, 231; Kinmont Poultry Farm, 227⅔; Shore, 227 1/3; R. H. Young, Santa Cruz, 223 1/3.

**High Hens to Date**

Stewart, 272; Thornewill, 259; Stewart, 252; Walls, 241; Hanson, 235; Stewart, 232; Russell, 231; Hanson, 231; Stewart, Santa Cruz, 229; H. C. Kleinsmith, Hoff, Oregon, 227, Barred Rock.

## THE 1922 HONEY CROP

By Henry Perkins

The 1922 honey crop has been very satisfactory thus far both as to quantity and quality. The output of orange honey was considerably below normal in most vicinities while in others it was slightly above normal. The sage and buckwheat yield has been very fair indeed. A great deal of the crop of all grades is still in the hands of the grower. The above report refers particularly to southern counties, the central part of the state being considerably late and yet to be heard from.

The honey market shows a moderate demand for the higher grades. Sage and white orange honey is selling from 8 to 8½ cents. The market on the lower grades is not yet fully established. Such sales as have been made indicate the price of 5½ to 6 cents.

The California Honey Producers Cooperative Exchange is no longer a factor in the market. I understand that their affairs are being administered by the creditors. However, on this point I must admit that I am not fully informed. To all appearances the California Honey Producers Cooperative Exchange is a thing of the past. It is to be regreted that the beekeepers have failed to organize their industry as successfully as other agricultural producers have done. However it must be borne in mind that all great successes are built on failures. There is a right way to do it and sooner or later it must be found.

Then there is the man who seems destined to go through life hitting his thumb on the back while trying to hit the nail on the head.

Lots of men think they are standing up for their rights when they are merely lying down on the job.

# 1000 Eggs in Every Hen

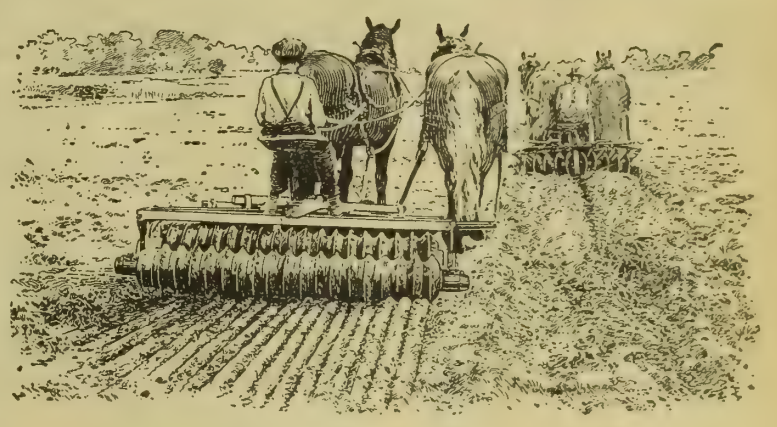
New System of Poultry Keeping—Get Dollar A Dozen Eggs—Famous Poultryman

## TELLS HOW

"The great trouble with the poultry business has always been that the laying life of a hen was too short," says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then, she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through cold winter months when eggs are highest; triple egg production; make slacker hens hustle; $5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how, if you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 243-N, Herald Bldg., Binghamton, N. Y., and a free copy of "THE 1,000 EGG HEN" will be sent by return mail.



# Break Up the Clods and Firm the Subsoil with a Dunham Culti-Packer

Your plowed or disked soil, such as in winter wheat fields that lie open for several months, needs working with the Dunham Culti-packer. With this efficient tool you can break up the clods, making a perfect seedbed. Besides firming the subsoil, the culti-packer prevents surface-blowing.

When used after the grain drill, the Dunham presses the soil around the seeds. This assures contact with moist ground and early sprouting of the germ. The slightly ridged surface produced by the culti-packer prevents baking of the soil, and at the same time it is sufficiently rough and firm to prevent blowing. The field worked with a Dunham is an ideal seedbed.

Thousands of farmers are already profiting by the use of Dunham culti-packers. Every day they are uncovering new uses for these tools, and finding new reasons why they can consider their purchases in the light of investments. Why not prepare for better soil-working on your farm this year? The nearest McCormick-Deering dealer will tell you about the Dunham.

Pears: Demand moderate, market steady. Northern: Bartletts, few best, 5@6 lb.; mostly, 3@4.

Plums: Demand and movement slow, market dull. Per lb., all varieties, 1@3. 2; Satsumas, 2@4.

Watermelons: Imperials and local; Angeleno, 1@1½ lb.; Klondike, 2@2½.

### CITRUS FRUITS

These are actual prices obtained bebetween 7 and 8 o'clock, August 15, by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms, cash on the walk. There may be slight fluctuations during the day's trading. Higher prices are frequently obtained where credit is given or goods are delivered.

Grapefruit: Market steady. Californias: Northern, packed box, fancy, 6.00@7.00; market pack, 3.75@4.50.

Lemons: Demand and movement light, market firm. Special brands, fancy, 6.75@7.00; choice, 6.00@6.25.

Oranges: Demand moderate, market steady. Valencias, special brands, 10.00@10.50.

### HONEY

Demand and movement moderate for carlots, market about steady. Extracted: Carloads f. o. b. usual terms—fancy water white orange and sage, 9¼@9½; white, 8½@9; several cars water white sage reported at 9; light amber sage, 6½@7; light amber alfalfa, 5½. Beeswax: Beekeepers reported receiving 22 per lb. Northern California new crop just starting to move. Market dull and demand light. Nothing being exported at present. Extracted: Hawaiian honey quoted lb. f. o. b. San Francisco, water white, 6½; light amber, 5½; dark amber, 5¼; honey dew honey, 3¾.

### BEANS

F. o. b. Cal.:

| | |
|---|---|
| Lima, Standard | 8.50@8.75 |
| Lima, Henderson Bush | 8.50@8.75 |

Cal. Lima Bean Growers Assoc. reports some sales made in June for Oct. delivery of 1922 Limas and Baby Limas at around $6.25@6.40 f. o. b. Coast. Demand for futures now quiet. Assoc. has been sold out of 1921 crop for some time.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 18.00@23.00 |
| Barley | 16.00@20.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@22.00 |
| No. 1 Alfalfa | 16.00@18.00 |
| Standard Alfalfa | 11.00@13.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@20.00 |
| No. 1 Dairy | 14.00@15.00 |
| No. 1 Alfalfa | 12.00 |
| Wheat Straw | 6.00@8.00 |
| Barley Straw | 4.00@6.00 |

### GRAIN

Prices L. A. Grain Exchange, August 15: Barley: 100 ton lots September Del., 1.26½. Milo: 100 ton lots, October Del., 1.40.

Grain Department California Farm Bureau Exchange:

The San Francisco markets seem to be easier than Los Angeles for prompt delivery stuff, but we feel that this would not be the case if it were not for the present unsettled conditions due to the railroad strike.

Barley. Spot barley would bring around $1.30 and August delivery barley sold at $1.27½. The seller, unless he has it in Los Angeles, is in a dangerous position as he isn't sure he can get it here in August. Barley for shipment with no guarantee of delivery could not be sold at more than $1.25 for the best grades at Los Angeles. The Farm Bureau Exchange has one or two outlets where prompt shipment stuff of an exceptionally good quality would bring more money than this.

Wheat. Spot wheat is the only wheat that is in demand. We can hardly get bids for shipment wheat as wheat from outside of the state is now being offered at constantly lower prices and unless California wheat comes down, we will see wheat from out of the state fill the terminal market requirements in the very near future.

# San Francisco Markets

San Francisco, August 16, 1922.

### BUTTER

**Raisins, Sun-Maid Raisin Growers' Prices:**

Under the schedule of prices for the 1922 crop of raisins announced by the Board of Directors of the Sun Maid Raisin Growers to the trade August 9, the growers will receive 5¾ cents for Muscats, 6 cents for Sultanas, and 6½ cents for Thompson's sweat box basis. Northern bleached Thompsons, (Sun Maid quality) oil dipped, soda dipped or choice sulphur bleached Thompsons will bring the grower 6¼ cents. Fancy Northern sulphur bleached (Sun Maid quality) will bring $40 more per ton, extra fancy Northern sulphur bleached (Sun Maid quality) $60 more per ton. Southern bleached (Sun Maid quality) oil dipped, soda dipped and choice sulphur bleached will net the grower 6¾ cents. Fancy Southern sulphur bleached (Sun Maid quality) will bring 9cents. Extra fancy Southern sulphur bleached (Sun Maid quality) will bring 9 cents. Extra fancy

Northern or Southern bleached packed by growers, (California brand) soda dipped, oil dipped and choice sulphur bleached are named at 5¾ cents. The price for fancy sulphur bleached (California brand) 9¼ cents. Muscat layers 3 and 4 crown, all packs will bring 7 4-10 cents. Six crowns will net 8 4-10 cents. A $15 bonus will be paid for making layers in addition to half-cent quality bonus for extra standard grade. Layers will be settled for on packout basis as provided for in the crop contract. "These prices," said F. A. Seymour, general manager, "will be returned to the grower on a sweat box basis. Their realization, however, depends upon the disposal of the entire crop at the new prices named by the board."

The revised prices on the 1921 crop named August 1 are:

| | Revised Price |
|---|---|
| Bulk Thompsons | 9½ |
| Carton Thompsons | 10 |
| Blk. Seeded Muscats | 9 |
| Fancy seeded pkgs | 10¾ |
| 1 cr. loose Muscats | 8½ |
| 2 cr. loose | 9 |
| 3 cr. loose | 9½ |
| Bakers. Thompsons | 7½ |
| Sultanas | 8½ |
| Seeded Malagas | 8½ |

### HAY AND FEEDSTUFF

A. W. Scott Co. says under date of August 12:

Receipts past week 2282 tons as compared with 2473 previous week. Shipping and coastwise trade have maintained fairly well. Interior trading has not been quite as active as in the previous week although a few sales of larger crops have been reported and a little easier prices. Movement is beginning towards the warehouses but not as yet in any considerable volume. The effect of the railroad situation has not been particularly noticeable through the country district, the general impression being that matters should be adjusted before a serious result on our local California lines. Alfalfa has been steady and at unchanged prices, shipments not quite up to those of the previous week. Movement is general.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

### CALIFORNIA CATTLEMEN'S REPORT

San Francisco, August 14.—The Chicago market remains strong. Receipts during the past week have shown a considerable increase over the previous week and the price has improved again approximately 15 cents a hundred. The price of cattle has also improved at Denver, fed steers selling for 8¼ cents on that market. Practically no cattle are being shipped into California from eastern points at the present time.

The San Francisco market is showing good activity, with a strong demand for choice quality cattle. Steers weighing 1200 to 1250 pounds are bringing a premium. Good choice fat steers of that weight will bring 7 cents f. o. b. ranch within reasonable freight distances. Sales are reported this last week at 7 cents ranch for approximately 1500 head from Kern County, while poorer quality, light weight and unfinished steers have been bringing 6½ cents f. o. b. ranch. Cows have been selling for 5½ cents in good flesh and 5 to 5¼ cents for cows only half fat. Light calves are brining 8 to 8½ cents f. o. b. ranch.

The Los Angeles market remains strong with a good demand for calves. Sales are reported at 7 cents f. o. b. ranch in Kern County to Los Angeles buyers for grass fat steers and sales are reported at 5½ cents for cows and 6½ cents for steers f. o. b. ranch for delivery during August and September. Calves are bringing 9 cents f. o. b. ranch in Santa Barbara County to Los Angeles buyers.

The railroad situation looks rather serious, but it is impossible to get definite information from railroad officials or any other source. A careful survey of available cattle on hand at market points is being made today, but it is our opinion that there is a comparatively small amount of cattle on hand.

It is reported that cattlemen are attempting at this time to sell feeder and beef cattle together. We believe this is an exceedingly poor practice at any time, but particularly under present conditions when there is a good demand for both grades but not from the same buyer. Forcing half fat cattle with fat cattle will lower the price and hurt the market. Cut out and sell your fat cattle for beef and use your association to place your feeder cattle, if they must be disposed of.—R. M. Hagen, Secretary.

### CALIFORNIA CATTLEMEN'S REPORT

San Francisco, August 7.—The Chicago market showed a decrease in receipts during the past week and about 25 cents per hundred increase in price. Fed steers sold from 8.25 to as high as 10.40 during the week. The Denver market paid as high as 8.25 for grass fat steers during the past week.

The San Francisco market appears to be somewhat strengthened and improved. While packers have been quoting 7 cents weighed off the cars in San Francisco, as high as 7.50 was paid f. o. b. San Francisco during the past week. Sales are reported at 6.25 f. o. b. ranch in north coast counties and in Sacramento Valley counties. Sales are reported from Tulare County to San Francisco buyers at 6.75 and 6.80 f. o. b. ranch for 1100 pound grass fat steers.

The Los Angeles market also appears to be somewhat improved, sales being reported at 7.50 delivered in Los Angeles for steers and 6.25 delivered in Los Angeles for cows. Sales to Los Angeles buyers are reported at from 5.25 to 5.50 f. o. b. ranch for cows, and 6.25 to 6.50 f. o. b. ranch for steers. Los Angeles buyers have made purchases in Tulare County at 5 cents for cows and 6.50 for steers f. o. b. ranch.

There is a continued and increasing demand for feeder cattle and a disposition on the part of buyers to pay at least 5½ cents for such cattle as are suited to put on feed and be ready for market by February and March of next year.

Sell only fat cattle. Sell only f. o. b. ranch or cars. Report sales to your secretary.—R. M. Hagen, Secretary.

### SHE SELLS SEA SHELLS

(Continued from Page 171.)

previously impossible could be grown at a profit after the soil was limed.

Schultz, of Lupitz, one of the most practical agriculturalists of northern Germany, demonstrated the immense value of marl in developing the productiveness of the light soil of that section of Germany. By its use, in connection with abundant potash and phosphoric acid, he met success in growing leguminous plants which gather from the air large stores of nitrogen, thus making it possible by this addition of plant food and humus to cultivate the light soil at a profit.

"Haxton, in a prize essay 'On light land farming,' mentions a number of siliceous sandy soils in various parts of England which are greatly benefited by liming, and in speaking of the granite formation in Scotland asserts that 'the whole of the granite soils are deficient in lime and the first step toward their improvement, after being drained, is to apply this substance.'"

Californians who use lime in agricultural practice will hail with delight the marine shell deposits, for Farmer's Bulletin No. 921 "The Principles of Liming the Soil" states: "Oyster shells and clam shells when cleaned of dirt and organic material contain 90 to 95 per cent carbonate of lime." Bulletin 230 of the Wisconsin experiment station says: "When dry, shell dust contains approximately 95 per cent lime carbonate." The New York state college of agriculture at Cornell, in Bulletin 148 says: "Oyster or mussel shells are very pure and when pulverized to the same degree as an equally pure limestone they have the same value." In Bulletin 66 of the Maryland agricultural experiment station, "Lime, Sources and Relation to Agriculture," after describing the plots and the various crops used in their trials says, on page 130: "It will be noticed that the best yields were obtained with the lime in the form of a carbonate. The finely ground oyster shells, plot 9, standing first, and the shell marl, plot 8, standing second."

**"California's Need"**

Prof. J. W. Nelson of the University of California and for many years with the United States bureau of soils, says in Circular 111, "The Use of Lime and Gypsum on California Soils:"

"Generally speaking, it is likely that those areas in California receiving more than 20 inches of rainfall, such as the northern coast counties, much of the Sacramento Valley and the Sierra Nevada and Coast Range mountains, have lost their lime from the upper few feet of soil. Other old upland soil deposits, such as the red hardpan lands of the Sacramento and San Joaquin valleys and the old marine terraces and valley slopes in Santa Cruz and Monterey Counties and southward along the coast to Mexico, are usually either in an acid or neutral condition. Lands subject to overflow, those occupying stream bottoms or recently formed valley slopes with less than twenty inches of rainfall, usually have lime well distributed through the soil mass and are less likely to need this constituent. All soils, however, receiving large applications of organic matter should be examined periodically for their lime requirements."

In the above excerpt "valley slopes in Santa Cruz and Monterey Counties and southward along the coast to Mexico" would seem to include particularly all of the citrus growing sections of Southern California.

**The Need Supplied**

The orange orchards herein listed were visited by the writer, examined for results from the application of decomposed shell lime, and in most cases the owner was found at home and the matter discussed with him.

The writer recently spent a very interesting day looking for orchard owners who have used this form of lime during the past year, and herein will set down the testimony adduced. The source of supply was not asked, but it was learned that not all of it came from the same field or "mine," so that no one has a monopoly of these natural deposits, and investigation discloses the fact that such deposits are quite numerous throughout the state. The first of these belonged to Dr. W. G. Terry, of Los Angeles, and located near Claremont. Dr. Terry told the writer: "I applied five tons to the acre of this shell lime to my grove in September and the trees responded wonderfully. They are in better condition and of better color than at any time since I set them out eight and ten years ago. Around the reservoir are a number of trees that could not be cultivated or as well cared for as the others and these look very poorly. I gave these an extra dose of shell lime and now they look as well as the others. The results are so satisfactory that I expect to make another application of the same material next year."

C. L. Cahoon, just north of Pomona, said: "I put 7½ tons per acre of decomposed marine shall on my grove the first part of August, 1921. In conjunction with the barnyard manure, I have the best results that I have ever obtained from the use of any fertilizer, commercial or otherwise.

"I had considerable mottle leaf in my grove, but this condition is almost entirely eliminated. I have about one acre of very hard soil, and it is somewhat lower than the surrounding ground.

"After using marine shell this piece of ground is just as friable and in as good mechanical condition as the rest of the grove. Notwithstanding abnormal conditions existing last winter in the way of cold weather, I have above the average setting of fruit for this season, and it looks fine at the present time. I am entirely satisfied with the results."

W. W. Evans of Santa Monica has an orchard of Navels not far from the Cahoon grove. In July, 1921, he applied five tons to the acre on part of his grove and 2½ tons in November, when the remainder of the orchard received 9 tons to the acre. The whole has shown wonderful improvement, but that portion to which the lime was first applied, though lesser in amount, shows far greater improvement than that portion not treated until the following November. Evidently the trees improve with time, showing that the effects of liming are lasting. Mr. Evans grows both summer and winter cover crops which, in combination with the lime, have worked wonders in his orchard.

J. L. Lewis, in the same neighborhood as the two last mentioned, said: "I applied five tons to the acre in September and am certain my trees are in better condition than they have been for many years, perhaps since they were planted out. I am well satisfied with the results of applying shell lime."

J. P. Jackson, but a mile away, applied five tons to the acre in September and gave a number of sickly, mottle-leaved trees 50 pounds each as an extra "feed." Now all the trees are alike and the former sickly trees cannot be distinguished from the others. Wm. Frieze on a neighboring ranch had a similar experience, and of those visited not one expressed anything but the utmost satisfaction with results obtained from the use of decomposed marine shells.

### WESTERN STOCK SURVEY

During the past month Prof. Geo. I. Christie, director of the Indiana agricultural experiment station, and national authority on meat animal production, has been making a careful survey of livestock production in the Southwestern states.

After an inspection trip covering Arizona, California, Nevada, Utah and New Mexico Prof. Christie held several meetings with the livestock breeders of California and a final meeting under the auspices of the Los Angeles chamber of commerce, Friday, August 11, 1922, which was attended by a large number of business men and livestock breeders of Southern California.

At these meetings Prof. Christie gave the breeders of livestock and business men some interesting facts. He pointed out the condition of the ranges as they are at present operated, with a California crop of from 29 to 72 per cent in the different western states, showing the impossibility of successfully growing range cattle when only about 34 cows out of 100 on the range produced a calf each year. Prof. Christie gave the results of the government work in one district where better methods were introduced with the result that when the calf crop had been running around 30 calves to each 100 cows, they were now getting 74 calves to 100 on the range.

The matter of range area was discussed and Prof. Christie said that the statement that the western ranges were a thing of the past was erroneous as a large part of the western states was still available for the production of range cattle. He stated that 90 per cent of California was available for some form of livestock production.

One of the most interesting developments in Prof. Christie's survey was the facts he brought to the Southern California farmers whose major crop is alfalfa and barley. Prof. Christie says the great productive alfalfa and barley areas of Southern California will be able to feed out their cattle from this great southwestern range at a less cost than those fed in the corn belt.

Prof. Christie strongly recommended the establishment of the union stockyards in Los Angeles and predicted that in a few years these yards would be taking care of the cattle from the Southwestern states now being shipped at a great freight cost to the Denver, Kansas City and Chicago stockyards.

### PUREBRED SALE

The Southern California Livestock Association will hold an auction sale of purebred stock at Hynes on Monday, August 21, beginning at 1 o'clock. There will be 20 young heifers, Holsteins, Jerseys and Guernseys, and 30 bred gilts, Durocs, Berkshires, Hampshires and Poland Chinas, and also six or eight head of sheep.

This stock is donated by the large breeders of Southern California, members of the Purebred Association, to provide a fund for maintaining that organization and assist in the work now in progress of promoting the purebred livestock industry. Each animal consigned will be representative of the herd from which it comes and will be either registered or eligible for registration. They will be all choice animals and the sale offers an opportunity to secure some choice stock from the very best herds of the state.

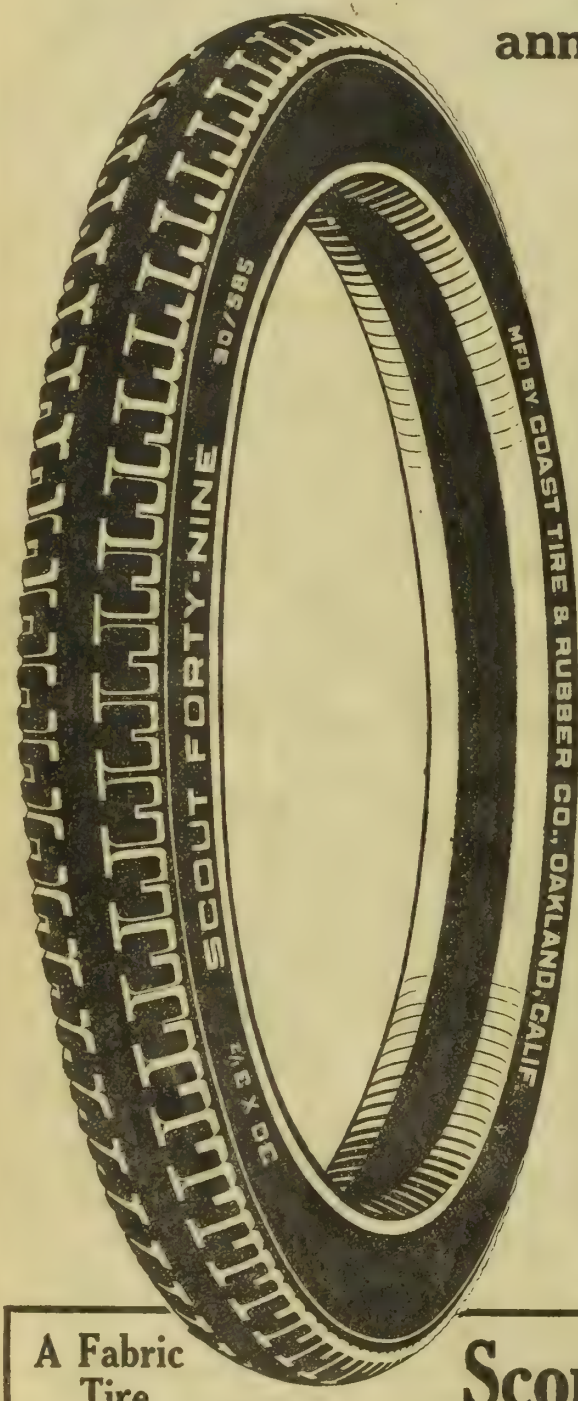
The terms of the sale are cash. Rhoades & Rhoades have donated the use of their pavilion and also their services in handling the sale.

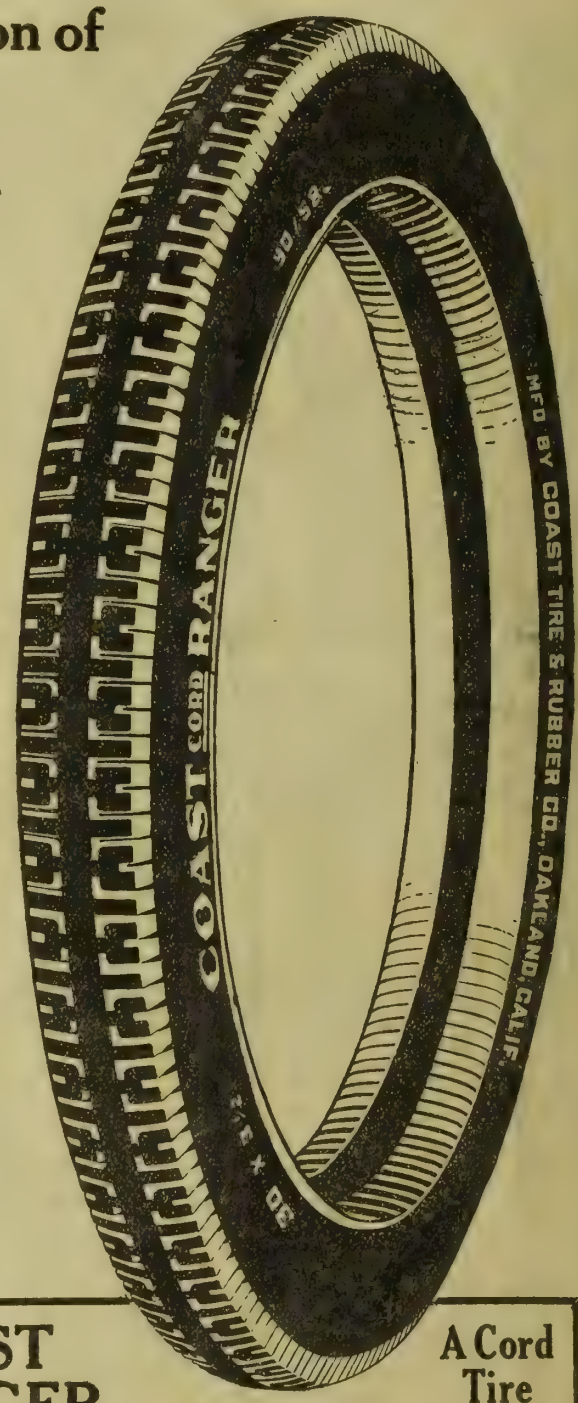
# Here's Some Good News

## The COAST TIRE AND RUBBER COMPANY

**announces the addition of**

# Two New Tires





**Priced to meet the new demand**

**The Scout "49", a new design, standard size, non-skid tread, clincher type, fabric tire. The Coast Ranger, a specially designed cord tire, in both clincher and straight-side types, made in substantial oversize, with broad, heavy non-skid tread. These two new type tires were designed by the same engineers, constructed in the same factory, under the same exacting supervision as the immensely successful, super-quality Coast Tires. Every detail of design, material, and construction combine to make these tires worthy of your entire confidence.**

| A Fabric Tire | Scout "49" |
|---|---|
| 30 x 3 Clincher type | $9.49 |
| 30 x 3½ Clincher type | $10.49 |

| COAST RANGER | A Cord Tire | | |
|---|---|---|---|
| 30 x 3½ Clincher Type.... | $14.95 | 30 x 3½ Straight Side..... | $16.25 |
| 31 x 4 Clincher Type.... | $22.15 | 31 x 4 Straight Side..... | $24.00 |

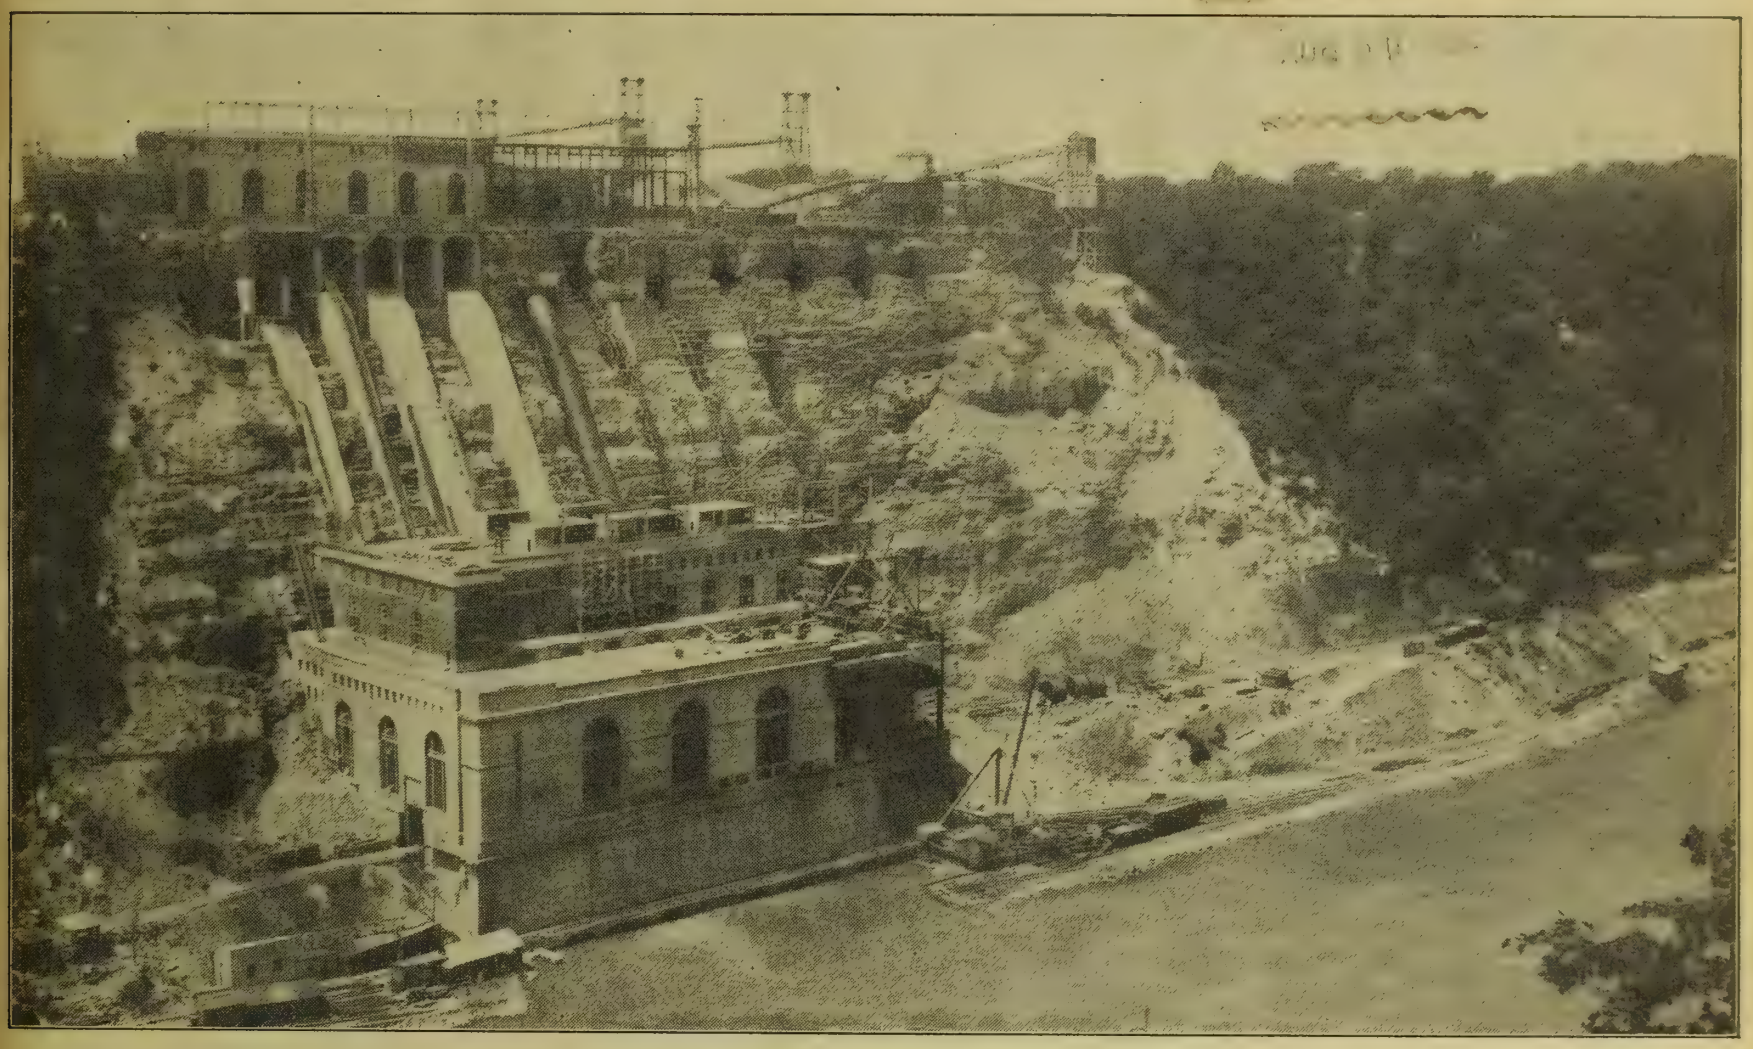
UNIVERSITY OF [illegible] LIBRARY



## Photographed a Mile Away---It Looms Big

This photograph shows a portion of Canada taken from the U. S. A. The Cultivator camera was on the bank of the Niagara River a few miles above Lewiston, New York, and was leveled, or depressed rather, so as to take the above view of the Queenston Hydro-Electric plant. Bear in mind, the camera is nearly a mile from the great structure down in the gorge, and to form a correct idea of proportions note the standard gauge railway on the structure just above the water in the center foreground. Freight cars standing in right center and blacksmith shops and other buildings in lower left aid in comparison. The superstructure, or small building on top of the greater one, is a three-story building. The big steel penstocks, one of which is not yet covered with concrete, have a diameter of 16 feet at the upper end, 14 feet at the lower, each carrying water under a 305 foot head and each generating 55,000 horsepower. The turbines are vertical, single runner type, connected with a three phase 25 cycle generator delivering power at 12,000 volts. The current is immediately "stepped up" to 110,000 volts for transmission to far away districts. When this picture was taken only three of the 55,000 horsepower generators were installed and in operation. Two others are building, one now near completion. It may be seen from the photograph that the building is being extended along the bank down stream. The other four turbines and generators will be installed later.

The water is taken out of the river above the falls, the Welland River being used as a part of the canal; in that the water is forced to run up stream. The canal supplying the water is twelve and three-quarters miles long. Other information regarding this great plant will be found in an article on third page of this issue.

All told when finished this plant will create power the equivalent of half a million horses.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## STATE FAIR

A letter from Secretary Paine indicates preparations for the 68th Annual California State Fair are practically completed. County exhibits are already under way. These usually fill the horticultural hall. However, there will be numerous plate and other exhibits of fruits and nuts. Tractor and implement exhibits are promised which will be educational.

Livestock entries are now closed and stockmen generally are pleased with the outlook. There are nine exhibitors of drafters, a score of beef cattle exhibitors, but the strongest list of all is of dairy cattle, and these entrants are coming from almost every section of the state. There does not seem to be a single entrant of Angoras, but the milk goat classes will be well filled. Sheep will also make one of the finest showings in years. In the swine classes Poland Chinas show the greatest number of exhibitors with Duroc-Jerseys second and Berkshires third.

## HELP FROM WASHINGTON

Last week we remarked on transportation conditions and the fact that millions were being lost by California producers because of strike conditions which have been permitted to continue beyond all reason, then we asked, "Have the people no friend in Washington?" About that moment Secretary of Agriculture Wallace in making an address on present day conditions referred to the long continuation of the strike, the interruptions of transportation, and refusal of dealers to buy because railroads would not haul—all of which resulted in serious hammering down of prices to the increased loss to farmers. Mr. Wallace makes appeal to the quarreling factions to cease that the farmer may be encouraged, or at least enabled, to continue food production that the striker and rail owner may eat. If the farmer doesn't continue production someone is going hungry—presumably it will not be the farmer!

Strength to the arm of Mr. Wallace and others connected with the administration. But, honest to goodness folks, the time has come when strong words avail little; we need vigorous action.

Dispatches announce at the last moment "Millions of dollars of loss will be saved to fruit growers of California if"—wine grape growers will consent to ship their fruit in ventilated cars—if the shippers of perishable food will be content with the allocation of 8,000 out of 90,000 refrigerator cars—and if a number of other ifs are all observed. The dispatch announces that 100,000 additional refrigerator cars are needed in this country, strike or no strike. So it appears that under all circumstances the fruit grower is up against it for the next few months.

## HARRIS WEINSTOCK

While riding with a granddaughter at Los Altos on Sunday afternoon, Colonel Harris Weinstock was thrown by his frightened horse and so seriously injured that he died on Tuesday.

Colonel Weinstock was born in London, September 18, 1854, and was educated in New York. He engaged in the dry goods business in San Francisco in 1872 with David Lubin and later the firm extended its activities to Sacramento. The San Francisco business was disposed of and the Sacramento business was built into one of the outstanding dry goods establishments of the state. Later he retired from the active management of the business but continued an even more active life in connection with the Federal Industrial Relations Commission and as market director of California. In the latter capacity he worked in connection with many of the cooperative marketing organizations of this state and brought together poultrymen, fishing interests and workers in other productive industries in new marketing organizations.

He has been a great factor in the upbuilding of the state and his pleasing personality has endeared him to Californians.

## WILLIAM R. NUTTING

Another California pioneer is gone. William R. Nutting, aged 71, died while visiting his daughter at General Grant Park, on August 8. Mr. Nutting was one of the San Joaquin Valley's oldest pioneers. He planted one of the first raisin grape vineyards in the valley; he was first to lead in organization of the raisin growers into a cooperative marketing association. While to him belongs the credit for the perfecting of this great organization it required a fight of many years to bring it to successful operation. Since its organization he has devoted himself to development of his own properties. However, during the past two years he has made experimental plantings of dates amongst which he hoped to find some which would prove successful under San Joaquin Valley conditions.

Some of the particulars of Mr. Nutting's life as given by the Fruit News are:

"Mr. Nutting was born September 1, 1850, in Ohio and is a descendant of English stock coming to this continent in the early part of the seventeenth century. After a business activity in Boston, in the early days of electrical development, in which line also a number of Mr. Nutting's visions have since been of great value, he came to San Francisco and later went to the San Joaquin Valley where he organized and conducted for some years the American Seedless Raisin Company, later known as the American Vineyard Company. This business helped develop the Thompson Seedless as a raisin grape and shipped this variety in package form under the Not-a-Seed brand and was largely instrumental in developing both the Thompson Seedless and the carton for raisin purposes. Subsequently Mr. Nutting organized the California Raisin Exchange, which developed into the California Associated Raisin Co., of which his idea was the inspiration, and while many others assisted in the latter, W. R. Nutting has to his credit the inception of the present raisin association, of which he has been a trustee since.

"He is survived by three sons, one of whom has been the head of the American Vineyard Co. for several years, and two daughters, of Fresno and Los Angeles. The Fresno Republican, in editorializing on Mr. Nutting, says that his mind was too full of concern for public benefit to be occupied with his own affairs, but he differed from most visionaries in that he left a monument of accomplishment and 'W. R. Nutting is truly one of the builders of the San Joaquin Valley.'"

## DUE FOR A SHOCK

We fear there are two sets of fruit growers in this U. S. A. who are due to receive a distinct shock, or at least will be due to receive it within a few years. One is made up of the many producers of citrus in California, the other of the citrus producers in Florida. As a matter of fact the shock has already been felt by the California grower. When the Florida growers were here a few weeks ago, the leader of the party, Edgar A. Wright, made statements in effect that Florida plantings of new orchards were in excess of those in California. To this certain Californians have taken exception.

We are not informed as to the acreage of young nonbearing orchards in both Florida and California but, having spent a few days in Florida orchards and on lands which may make Florida orchards, we believe that Californians may well open their eyes to the fact that Florida has wonderful possibilities in the growth of the citrus industry. In a sense Florida is a much newer state than California. This, notwithstanding the fact that one of its little cities, St. Augustine, claims to be the oldest in this United States. Another fact to be borne in mind is that a few years ago when the northwestern blizzards swept through the groves of the northern end of the state and wiped almost every orchard out of existence the industry picked itself up, marched a few counties to the southward and will next year produce almost as many oranges as California. We think we are fairly safe in adding that should that blizzard be repeated and wipe out the northernmost orchards as they exist today there would still be possibilities of a southward march. We once considered The Everglades and Lake Okechobee as covering much of the state of Florida. Like the great American desert The Everglades have been shrinking, and the orange tree is adapting itself to many a situation formerly deemed impossible, and those orange trees have a rich dark green color that indicates the real producers. Florida has many lessons to learn in the growing of oranges, but she is coming to California and she is looking everywhere to learn those lessons. One which she is just beginning to learn is that the more than a score of varieties she is now marketing must be reduced to a few standards. She appreciates California's superiority in this one respect, that in reducing her oranges to the two favorites she has secured the lead. In oranges Florida is now shipping Lue Gim Gong, Parson Brown, Pineapple, Ruby, Surprise Navel, Valencia (the latter sometimes shipped as Tardiff, Hart's Tardiff, Hart's Late, etc.) and Temple. None of these seems able to forge ahead and make a place for itself as has the Navel.

But where the Floridans are due for a shock is in the production of grapefruit. Many of the growers are entirely ignorant of the fact that California is going to be one great big factor in grapefruit production. In speaking of grapefruit the Florida grower refers to the fact that the industry was created in that state and the only commercial shipments are the ones that have been made from Florida. He does not deny to California the right to make any claims it chooses to make, but notwithstanding all claims the Californian is simply not in the grapefruit game. We remarked to one or two of the grapefruit producers that in dining cars on a trip covering some 7,000 or 8,000 miles, also dining rooms of a score or two of hotels in the months of June and July we had been unable to get a single Florida grapefruit, and in a hotel in the heart of the great fruit producing section of Florida around the first of August not a grapefruit was to be had. Until we reached the Florida line, however, California grapefruit had been available at all hotels and in practically every dining car. Florida grapefruit does not cover the long season which is given to the California product. It has two faults, that of dropping from the tree and of growing or sprouting of the seed in the fruit. Because of these faults there are some three or four months of the year when Florida grapefruit is not able to dominate the market. In the meantime California has found varieties which are adapted to the state and produces some of the finest seedless fruit on earth. Florida growers do not know this and probably will not know it for several years. But the shock is coming, and perhaps about the time that California orange growers get their shock.

# Hydro-Electric Power on the Canadian Farm

By C. B. Messenger.

CONTINUING the item as to "Hydro As Is In Ontario, Canada" I am compelled first to confess entire inability to find words to explain in even small degree the thrill which really did come from viewing the waters of Niagara. The great rotar of the generator with its half million pounds of weight is so perfectly balanced that its 187½ revolutions per minute gave not the slightest jar or apparent vibration, yet there was an all pervading impression of intensity as one looked at the great machine and realized what it was accomplishing.

I recall well the time when California combined harvester and threshers were propelled by horsepower. It was my privilege to crawl out on the "ladder" and look down on the backs of 30 horses under control of a driver with one jerk line and a box of stones in lieu of a whip to stir the lazy ones to action. One look on that sea of backs was sufficient, and I wanted to and did climb off the driver's seat promptly. Since that time the meaning of "horse power" in the large has come to me from recollection of my experience in seeing 30 horses in one team. But as all things agricultural have advanced so has the operation of power, and today we are utilizing what years ago we considered only as a wonderful display of natural power. Instead of pouring over the brink of Niagara in a spectacular waste of energy, a portion—an infinitely small portion—of the waters is taken out, carried a dozen miles and poured over the edge of Niagara gorge with a sheer drop of over 300 feet, and the power which is generated is carried hundreds of miles to light homes, cook the food, cut the silage, grind the feed for the dairies, churn the butter and put all kinds of comforts in thousands of homes.

Thrilling? Indeed it was, but as I said, the dictionary has not yet given me the words to express it.

This is not the only place in which hydro-electric power has been used to add to human comfort. For many years California has been aware of her possibilities and large corporations have been saving the power of falling waters and California farmers have been enabled to redeem desert lands because of the power generated by water used to lift other water and place in irrigation ditches. Nor have these corporations been alone in this great work, though due credit should be given for their far sightedness. There have been municipalities and communities which have also used this God given power. People are today asking for greater development and use of power. There can be only benefit from looking to others who have appreciated and profited by the use of that which in all former time has been wasted. It must be had at the lowest cost consistent with good service.

So as I suggested in my former letter written from Hamilton, Ontario, I wish to refer this week to some impressions received in a long day's ride from that city and into the country, nearly half way between the head waters of Lake Ontario and Lake Huron, in other words, half way across the southern peninsula of the province of Ontario.

At Toronto I had asked where I could find some of the real kickers, or objectors, those who were opposed to hydro-electric development by the state. I was there told, and found it to be generally true, that there were practically no objectors to hydro-electric development, but that the objections were raised on the point that the hydro-electric commission was created to conserve, manufacture and distribute hydro-electric energy, but that after this was accomplished the

(Continued on Page 198.)

# The Farmer and Strikers

IN THE course of a talk before the Farm Bureau at Leesburg, Virginia, Monday afternoon, Secretary of Agriculture Wallace said:

It is worth while to compare wages in the organized industries with the wages received by the farmer, as represented in the price he gets for the things he grows. The value of income, whether it be in the form of wages or of money received for sales of products is represented not in dollars and cents, but in what that income will buy.

Take the average wage received by the coal miner for mining a ton of coal. In 1913 this wage per ton would buy 1.1 bushels of corn in Iowa; in 1921 it would buy 2.5 bushels of corn in Iowa. In 1913 the ton wage would buy .7 of a bushel of wheat in North Dakota; in 1921 .9 of a bushel. In 1913 it would buy 4.7 pounds of cotton in Texas; in 1921 8.5 pounds. In 1913 7 pounds of hog in Nebraska; in 1921 14 pounds. In 1913 .8 of a bushel of potatoes in New York; in 1921, 1.2 bushel. In 1913, 11 pounds of sheep in Wyoming; in 1921, 18 pounds. In 1913, 1.6 bushels of oats in Illinois; in 1921, 3.1 bushels. In 1913, 2.4 pounds of butter in Missouri; in 1921, 3.2 pounds.

Taking the average yearly earnings of railroad employes, we find that in 1913 the yearly wage would buy 1492 bushels of corn in Iowa, and in 1921, 4112 bushels. It would buy 1028 bushels of wheat in North Dakota in 1913; in 1921, 1466 bushels. In 1913 it would buy 6449 pounds of cotton in Texas; and in 1921, 13,934 pounds. It would buy in 1913 102 hundredweight of hogs in Nebraska; and in 1921, 237 hundredweight. It would buy 148 hundredweight of sheep in Wyoming in 1913; and in 1921, 296 hundredweight. In 1913 it would buy 1087 bushels of potatoes in New York; in 1921, 1916 bushels. In 1913, 2174 bushels of oats in Illinois; in 1921, 5109 bushels. In 1913, 3309 pounds of butter in Missouri; in 1921, 5285 pounds.

In 1913 the freight revenue per ton mile received by the railroads would buy 1.4 bushels of corn in Iowa; in 1921 this revenue per ton mile would buy 3.1 bushels of corn in Iowa. In 1913, 1 bushel of wheat in North Dakota; in 1921, 1.1 bushel. In 1913, 6.1 pounds of cotton in Texas; in 1921, 10.5 pounds. In 1913, 10 pounds of hogs in Nebraska; in 1921, 18 pounds. In 1913, 1 bushel of potatoes in New York; in 1921, 1.5 bushel. In 1913, 14 pounds of sheep in Wyoming; in 1921, 22 pounds. In 1913, 2.1 bushels of oats in Illinois; in 1921, 22 pounds. In 1913 2.1 bushels of oats in Illinois; in 1921 3.9 bushels. In 1913 3.1 pounds of butter in Missouri; in 1921 4 pounds.

In 1913 the price of a ton of coal f.o.b. the mine would buy 2.4 bushels of corn in Iowa; in 1921, 6.2 bushels; in July, 1922, 9.3 bushels. It would buy in 1913, 1.7 bushels of wheat in North Dakota; in 1921, 2.2 bushels; in July, 1922, 4.4 bushels. In 1913 it would buy 10.4 pounds of cotton in Texas; in 1921, 21.1 pounds; in July, 1922, 22.9 pounds. In 1913, 16 pounds of hogs in Nebraska; in 1921, 36 pounds; in July, 1922, 53 pounds. In 1913, 1.8 bushel of potatoes in New York; in 1921, 2.9 bushels; in July, 1922, 4.7 bushels. In 1913, 24 pounds of sheep in Wyoming; in 1921, 45 pounds; in July, 1922, 70 pounds. In 1913, 3.5 bushels of oats in Illinois; in 1921, 7.7 bushels; in July, 1922, 14.2 bushels. In 1913, 5.4 pounds of butter in Missouri; in 1921, 8 pounds; in July, 1922, 16.1 pounds.

In fairness it should be noted that before the corn, wheat, hogs, sheep, cotton, butter, or other farm products get to the consumer's table, a good deal has been added to the price the farmer receives. This margin between the farmer and the consumer has considerably increased during the past eight years, but it is also fair to note that a good deal of this increase has been due to the increase in the wages paid the people who handle these products. What these figures show is that the wages of the farmer, as represented by the prices paid for his crops, are lower than his wages were before the war, measured in purchasing power, while the wages of the workman, and especially in organized industries, are considerably higher than they were before the war, whether measured in dollars and cents or in purchasing power. The purchasing power of the wages of the railway employe in 1921 was 51 per cent greater than in 1913. The purchasing power of the wages of the coal miner in 1921 was 30 per cent greater than in 1913. The purchasing power of the farm hand who works for wages in 1921 was 4 per cent less than 1913, while the purchasing power of the farmer himself was, on an average, from 25 to 45 per cent less than in 1913.

In short, the farmers of the country, numbering almost one-third of our entire population, have borne altogether the heaviest burden of deflation. They have endeavored to get relief by all lawful means. They have appealed to the administration, to congress, and to every other agency which they thought might be able to help them, but while making these efforts to avoid their heavy losses they have not struck. They have not created disorders. They have kept on producing, and in the face of extraordinarily low prices have this year grown one of the largest crops in our entire history. The farmer believes in law and order. He believes in government. He believes in fairness between man and man. He believes in working hard and producing efficiently.

If other groups would do as the farmer has done, our economic troubles would soon be over. Prices would soon be adjusted to their normal relationships. There would be work for everybody, and at just wages.

But there are too many people who seem to be thinking only of themselves, and how they can profit at the expense of the community at large, and especially at the expense of the farmer. The farmer is sick and tired of this sort of business. He is disgusted with these recurring disputes between capital and labor, especially as connected with the essential industries. He sees no reason why such disputes cannot and should not be settled in an orderly and lawful way and without the interruptions of service which cost him so dearly.

The farmer recognizes his obligation to produce food, for people must eat to live. He demands that both the owners of the coal mines and the coal miners recognize their equal obligation to produce coal, and he demands that the management of the railroads and the railroad workmen recognize also their equal obligation to keep trains moving for unless the food he produces is moved promptly to market the people will starve.

If the various groups in this country are determined to prey upon one another and abandon law and order for strong arm methods, the farmer can take care of himself. He can reduce his production to his own needs. He can follow the example of some others that refuse to sell what he produces. But he does not believe in that sort of thing. He knows that such a policy would bring about in this great republic exactly the same sort of conditions that exist in Russia.

The farmer calls upon capital and labor to cease their petty bickerings and resume production, trusting to America institutions and the American sense of fair play to see that justice is done to both of them.

# Agricultural News Notes of the Pacific Coast

## Northern California

Yuba County fair was held at Arboga, August 13-20.

A home demonstrator has been appointed for Glenn County.

Esparto, Capay and Arbuckle report having started the almond harvest.

California's almond crop this year is estimated at 9,000 tons.

The Tehama County farm bureau will hold its annual meeting on September 4 at Courtland Park.

Three of the large prune orchards of the state have installed dehydrators with daily capacity of 40 tons.

F. N. Bigelow has been named chief of the state bureau of markets to fill vacancy caused by resignation of H. S. Maddox.

Arbuckle will make a special exhibit of almonds at the Colusa County fair at Colusa, September 13-17. September 14 is Arbuckle Day.

More than 1500 birds were entered in the poultry utility show which was a feature of the Sonoma-Marin Counties fair at Petaluma this week.

The new Sequoia Union High School situated in a 40 acre botanical park at Redwood City, will be ready for occupancy soon after January 1.

W. B. Smith, federal expert on rice grading will come to Colusa and Glenn Counties next month to aid growers in rice grading.

Petaluma was host last week to 27 members of the American Society of Instructors of Poultry Husbandry and other visitors from the state university.

Members of the Glenn County Holstein-Friesian Association have paid visits to the Holstein calf club members in the districts around Willows and Orland.

Several farmers of the Gridley and Biggs sections have made experimental plantings of an Hawaiian rice said to mature one month earlier than rice now being planted.

A new packing house is being built by the Miller-Cummings Company at Livermore to handle grapes. This county expects to begin shipping by the middle of September and to handle 200 carloads.

This year's asparagus crop in the Sacramento River delta section totaled 1,500,000 cases, worth $10,500,000, the largest crop on record. Ninety-eight per cent of the nation's canned asparagus is put up in Sacramento County.

The new cow testing association in Glenn County has been organized and six directors elected; Peter Kasak, B. J. Bills, Kirby Clark, M. J. Haigh, F. L. Dado and J. L. Fulton. A seventh director will be elected from the Willows district.

From San Francisco Quarantine Officer Fleury reports 13 seizures of mangos, oranges, grapes, avocados, and cucumbers from Mexican and Hawaiian ports, containing live larvae of the Mexican fruit fly and the Hawaiian melon fly.

Gravenstein apples are now coming in in the apple growers contest which was started in Sonoma County at the beginning of the season. Apples from the contest plots are being weighed and graded in the packing houses, and winners will soon be announced.

## Central California

The Delhi community fair is to be held on September 16.

The Central California Citrus Institute will be held at Lindsay, September 6.

The first carload of Pajaro Valley apples was shipped August 3. They were Gravensteins.

Farm bureau center meetings in Kern County at Shafter, August 28; Arvin, September 1.

Owners of 400 pure bred Holstein cows of Stanislaus County have formed plan for purchasing community sires.

A Fresno office of the California Canning Peach Growers has been opened in the Mattei Building. J. E. Smurr is in charge.

Lodi peach growers are drying much of their fruit because of transportation situation. Canneries are paying $60 for Tuscan clings.

It is estimated that from 75 to 100 cars of fresh figs will be sent to eastern markets. Fresh Calimyrnas will start in a week or two.

The packers and shippers committee of the Watsonville chamber of commerce is financing a campaign to advertise Bellefleur apples.

Directors of the Madera County farm bureau deny report that the farm bureau has started recall petitions for the Madera irrigation board.

San Benito County peach growers have pooled orders for paradichlorobenzine amounting to three tons. This is used in controling peach borer.

Prices on dried Adriatics have been increased one-fourth cent by the California Peach and Fig Growers. The new price is 7 cents, September or October shipment.

The Oakdale branch of the California Almond Growers Association has reorganized with election of J. B. Stearns as president, Wright Boddy, secretary and treasurer.

The Visalia chamber of commerce has taken the initiative in a movement to plant shade trees along one hundred miles of state highway between Kingsburg and Delano, and between Goshen and Lemoore via Hanford.

The California Prune and Apricot Growers did not name prices on 1922 prunes on August 9 as was expected. The management announces that because of the strike situation prices will not be named for some time.

President Niswander of the California Peach and Fig Growers says that association fig sales are good, and if they continue for a few days longer at the same rate the association will be sold out on Black Missions and Calimyrnas.

The Tulare Lake section had an exceptionally fine wheat crop, and the San Joaquin and Sacramento Valley crops were considerably above the average. The total production of wheat for the state is estimated to be 14,900,000 bushels compared with 8,355,000 last year.

The Tulare County farm bureau exchange has elected as its new board of directors: Allan Thompson, Tulare; Earl Houghton, Strathmore; E. B. Armstrong, Earlimart; K. R. Clifford, Strathmore; E. W. Hastings, Terra Bella; F. M. Carlisle, Ducor; and H. E. Martin, Tulare.

## Southern California

The apricot crop of the Redlands district will amount to about 2,000 dried tons, the largest handled in that section.

A new cannery has been established at Redlands which will can baked apples and feature Yucaipa Valley on the label.

Work is being rushed on construction of buildings on grounds of Los Angeles County fair at Pomona October 17-21.

A new storage ice plant will be constructed at El Monte because of the great increase in the production of potatoes in that section.

Walnut growers of San Gabriel Valley meet at Puente packing house this evening, August 26, at 7:30, to fix uniform picking price for the season.

R. B. Peters is acting as temporary manager of the Southern California Deciduous Fruit Distributors until a permanent manager can be secured.

Directors of the Blythe levee district are considering submitting bonds for $250,000 to rebuild levees destroyed by the flood waters of the Colorado.

Work has begun on a $600,000 dam in Littlerock Canyon that will treble the water supply of the Palmdale and Littlerock districts of Antelope Valley.

A mass meeting was called at Yucaipa Monday evening, August 21, to form a permanent organization to handle the matter of the annual apple show.

Acreage of bearing date palms in the Coachella Valley is estimated at 250. Producers of more than half the crop will send dates to the El Monte packing house.

The Riverside County cow testing association has been formally organized with election of officers. Howard Warren of San Jacinto was made director.

A basket of sapotes from Nicaragua was taken from steamer at San Pedro by Quarantine Officer Messenger who found in one of the fruits seven larvae of Mexican fruit fly.

The management of the Southern California fair to be held at Riverside, October 10-16, is giving 25,000 square feet to the poultry department and expects to stage the biggest show in the state.

Director Hart of the Corona Citrus By-Products plant says that the citric acid output of the Exchange Lemon Products Company last year amounted to 20 per cent of the domestic consumption. Italy has heretofore supplied this.

An innovation in the comfort and care of the public will be introduced at the Los Angeles County fair at Pomona thhrough the installation of numerous rest arbors, 100 by 200 feet. These rest arbors will be under cover and will be provided with tables and chairs.

A model demonstration farm is to be operated by boys from various high schools throughout Southern California as a feature of the Southern California Fair at Riverside, October 10-15. Work has already commenced on this model farm, to insure growing crops on a miniature scale which will mature during the fair.

## The Coast and General

Arizona's wheat crop is estimated at 1,234,000 bushels.

Canada's apple crop this year is estimated at 3,573,820 barrels.

The wheat crop in Great Britain is estimated at 93 per cent of average.

England has been importing larger quantities of raisins from Spain and Smyrna than heretofore.

The Isle of Pines exported 45,000 crates of peppers in 1922, much of it going to the United States.

Experimental plantings of cantaloupes have been made by growers in the Walla Walla district of Oregon.

The Pioneer Cow Testing Association of Twin Falls County, Idaho, has started on its eighth consecutive year.

China produced last year 324,881 tons of peanuts of which one-fourth was exported. Japan was the largest importer.

The meeting of the Colorado River Commission which was scheduled at Santa Fe, August 28, is to be delayed, probably till October 2.

Algerian sheep are being shipped into France in great numbers as a result of the continued drouth throughout northern Algeria.

A monument commemorating discovery of the Delicious apple was dedicated at Winterset, Iowa, August 15. The apple was discovered in 1872.

A team of Maryland boys sent to England by the Southeastern Fair Association of Atlanta, Georgia, won the Northcliffe cup for livestock judging.

More than 70,000,000 feet of lumber were shipped from the Columbia River in June and a greater amount is expected to go out this month says an Astoria report.

Sales Manager Herbert of the Yakima Fruit Growers Association says his association will have a big supply of Jonathans and Rome Beauty's to ship this fall.

A citrus school was recently held in Cameron County, Texas, by the extension service of the state college. Over 600 enrolled. This was the first citrus school held.

The Colorado potato bug has made its appearance in the district about Bordeaux, France, and is being energetically fought by state authorities. This beetle appeared near Cologne in 1877 but was eradicated.

Professor P. M. Brandt, head of the dairy department of the Oregon agricultural college, has been selected to judge all breeds of dairy cattle at the California state fair at Sacramento the first week in September.

Twenty thousand freight cars will be needed to move the Idaho crop of potatoes this season, according to official estimates made by commercial organizations and from a survey made by railroads operating in the state. This is an increase of 5772 cars over the number used in 1921.

A ten gallon can of fresh milk treated by the Jonas Meilsen system of pasteurization has just arrived in London from South Africa. Tests proved that the fat rose as cream in normal manner and the keeping qualities of both cream and milk were not affected up to 72 hours' exposure to the heat and atmosphere of a London office.

# Olives at a Profit

UNLESS an industry is maintained at a profit it ceases to be. Unless olives are grown and marketed at a price which allows the grower enough to cover costs of production plus a reasonable profit California will lose one of its valued industries. This industry is one of the oldest and should be one of the most profitable, for production of food of such great value as the olive is of benefit to the state and to the entire country. Marketing conditions during the past two or three years have been such that olive growers not only received no profit but the cost of the maintenance of the orchard property they have had to secure from some source other than olive trees. Of course eternal hope in its being better farther on has saved the most of our fruit. This cannot last much longer and unless something is done, and quickly, the olive tree will soon give way and others which will give the grower a living chance will be planted.

We believe one of the most patriotic efforts along this line has been made in the organization of the California Olive Growers. A. M. Drew, president of that association, gave some very consistent and proper reasons for the organization of the olive in the issue of the California Cultivator of July 8. In a word, the object of the association is to secure successful marketing through standardization, advertising or any other step which would save the industry. In that letter Mr. Drew said:

"Hitherto the grower has been led to believe that only the packer could cure and pack olives and that his business was simply to keep at work growing olives and turning them in to the packer, taking what he, the packer, might see fit to give him."

Mr. Drew also referred to prices which have been paid for the fruit and prices which have been paid by the consumer for the fruit after processing. This brought from E. Ludwig, a subscriber at Oroville, the suggestion that olives could not be sold at 25 cents per quart without net loss to the packer even if the fruit were delivered to him without cost. To this Mr. Drew replied by giving details of costs showing that olives could be sold at 25 cents and leave to the grower $100 per ton. These figures of Mr. Drew's were given on page 147 of the issue of August 12. This statement brings reply from Mr. Ludwig as follows:

I have read with interest the article of Mr. Drew, setting forth how he is able to make a quart can of medium olives a 25 cent seller and at the same time pay his grower members a net return of $100 per ton for this size olive. This looks very good indeed, but what I would ask Mr. Drew is: "How much did your growers get last season for the medium olives?" for I am still positive that they didn't get much, if anything, for their medium olives, if they were sold on a similar basis as stated above. A financial success does not consist of selling olives before they are packed, but it is based on the net return to the grower; for any packer can sell his goods below market prices if he wants to before the fruit is harvested, but he can't afford to do it because he has got to pay for his fruit, while the grower packer if he sells below market price, gets his packing cost back quickly, but the grower gets nothing for his fruit.

I am of the opinion, that Mr. Drew meant all right by giving these figures but I am afraid these are only arbitrary figures and would not agree with the books of his informant at the close of the pack. Since Mr. Drew invites criticism of his figures of olive packing cost in your issue of August 12, I feel that I should express my views in this matter. Not knowing the general routine of Mr. Drew's handling of the olives and keeping of his accounts it is difficult to state exactly what charge is included and what is not included. I therefore will take Mr. Drew's cost figures and add to same the items which he apparently left out:

Olive packing cost according to Mr. Drew, per ton, $125.

Plus the following items: Processing and curing (including processors salary) $5 ($3 is far too low to turn out quality fruit.)

Salt and caustic (it appears that $1.33 is about the cost of water) $5.

Factory expense (including wages of warehouseman) $5.

Cases (quart cases could not be obtained last season for 11 cents made up) $2.

Samples, insurance, advertising (not included in Mr. Drew's figures) $14.

Depreciation on plant and equipment, $16.

General factory overhead (including office and managers salaries) $20.

Interest on investment 6 per cent, $13.

Making a total cost of quart cans per ton of $205.

(Please note, that I have not challenged all the figures which seemed to be out of line and which would further increase the cost).

Proceeds:

Selling quart cans at 25 cents retail or per case of 2 dozen, $6.

Grocer wants a gross profit of 30 per cent on above, $1.80.

Selling price to retailer, $4.20.

Jobber wants to make a gross profit of 15 per cent on $4.20, 63 cents.

Selling price to jobber, $3.57.

Broker wants to make at least 5 per cent, 18 cents. Total $3.39.

Freight charges, 50 cents.

Net price to packer, $2.89.

Seventy cases per ton, $2.89. Total $202.30.

The result would be a loss of $2.70 per ton and the grower gets what?

To turn out a first grade ripe olive the processing cannot be rushed, and great care has to be exercised and cannot be done cheaply. Of course one can pickle ripe olives at a fraction of my figures, but the result will be that the olives are hardly fit for human consumption or are in such condition, that dealers will buy them merely because they are cheap and they know they can sell them cheap to the undiscriminating public, all of which would be detrimental to the olive industry.

You may use this letter as you see fit, my only interest being that the growers, having been misled long enough, should get the absolute facts so that they can see their way clear in the future.—E. Ludwig, Butte County Olive Grower, Oroville, August 14.

Mr. Ludwig is certainly taking care of the interests of the man who is going to pack his olives for him. He has allowed him on the four items of interest, overhead, depreciation, advertising, etc. $63 per ton, and for processing and curing (including processor's salary) Mr. Ludwig adds $5 more.

We are reminded of the ship building situation during the war. Without any limitation the builders were told to build ships and add ten per cent as their profit. We surely built ships, but the awfulness of the cost created a world wide scandal. For many years growers have felt that the cost of processing, canning or packing of fruit was of little concern to the packer. Too often he has been able to control the producers price so that no matter what the costs might be the packer still "gets by." We think practically every successful cooperative marketing association in California has made greatest effort to reduce this packing cost. In 1893-94 when the orange growers first organized, the managers of the packing houses were almost invariably from the orchards, with practically no knowledge of the packing or marketing end of the industry. Yet through integrity of purpose and enlightened selfishness efforts were continued until packinghouse costs were cut nearly in half. The same spirit still prevails among many of our larger fruit handlers.

The transportation companies take the same attitude that, regardless of the costs of railway maintenance, the capital invested is sacred and must be protected, and, pile up as the cost will, there still must be a reasonable profit for the railway owners. This attitude is supported by the state railway commission so it is excusable for the Butte County grower to accept such decision as final. But we honestly cannot see where a grower is justified in figuring such profits to the retailer as has Mr. Ludwig. He begins at the consumers end and figures from the consumer's price, a profit of 30 per cent or $1.80 on each case. This would be a profit of 43 per cent on the price of a case of olives to the retailer. We fear if many California olive growers are willing to concede such profits and such salaries and overhead as Mr. Ludwig considers necessary there will soon be an end to the olive industry in this state. We trust, however, that public spirited growers will do a bit of pencil work and determine to support cooperation.

# Making Good With Poultry and Fruit

By M. E. Bemis

YESTERDAY I talked with two men, both farmers, both following in a way the same line of farming, that is fruit and poultry, or, to be more exact, it is fruit and poultry with one and poultry and fruit with the other. The first has a considerable acreage, capital to hire hep, and the vision to see ahead what can be done. Some time, possibly not for two years yet, his will be a model farm and an ideal country home. To make of it the place that he sees in his vision, and the place which he in his enthusiasm makes the visitor see that it will be, will require more money and more time. His is not a poor man's proposition. The second place is an example of what a poor man can do, with little to do with "except the will which says to them 'Hold on.'" It is the story of the latter place that I would tell you at this time. It is the story of struggle against debt, of adverse conditions overcome, of a man none too strong, of denial, and discouragement, with naught to keep up his spirits but an abiding faith and a courageous wife.

### A Start on $50—Borrowed at That

Albert Liggett is not a new comer to the Salt River Valley. I think I met him first some ten years ago, a clerk in a Phoenix store. Not particularly strong, he followed the calling of a clerk and bookkeeper till about five years ago. Probably it was about that time that he married and decided that a home would be a desirable thing to have. The beginning was made with a rented farm of two and a half acres a few miles from Phoenix. The break was made from clerkship to proprietor of a business by borrowing $50 at a high rate of interest. With this he bought live poultry, took it home and dressed it, then sold to private customers. There was no fortune in this, but it meant a little more than a living, and the business gradually grew and more stock was added. After about a year and a half, the rented place was purchased on contract, the first payment of $200 was partly of profits that had not gone back into the business and partly from borrowed money.

It was nearing spring, and always there is demand for day old chicks. To help to supply this and at the same time to help out his income he wanted to try out the hatching business. No money, no incubator cellar, no incubators, and but few eggs, but plenty of nerve. He went to one of the dealers in incubators who was also retailing day old chicks and said to him: "You sell me some incubators, and I will pay you for them in day old chicks." "But where is your cellar?" he asked. "Never mind that, I'll furnish the chicks if you let me have the incubators." The argument ended by selling Liggett the incubators, and that part of the story of high financing ends with the simple statement that he paid for them as agreed, and bought more and paid for those, and made some money, more than living expenses, and broadened his business.

He had no incubator cellar, but a hole was dug in the ground, covered with poles and brush, and then with dirt, and fairly good hatches were made in this makeshift cellar. No doubt this cellar was a source of no little grief in one way and another, and here he began the study of ventilation for incubator houses which will be mentioned more in detail later.

### Bought Ten Acres

About two years ago he realized that to expand his business as he wanted he must have more land. In the meantime he had made substantial payments on his place and was able to sell at some profit. With this start

(Continued on Page 213)

## HYDRO-ELECTRIC POWER ON THE CANADIAN FARM

(Continued from Page 195.)

commission, by direction of the provincial parliament, had proceeded to erect and operate radial or suburban railways. It is true that these railways are being constructed by the commission; they are also being operated, and so successfully that outlying communities are growing and adding to the wealth and to the comfort of the province. However, I gathered no information as to these radials, my only effort being to learn as to uses being made of hydro-electric energy and as to whether its distribution was made at a price which would allow of its use in rural communities.

When I asked as to the objectors and where I could find the greatest number of them, I was referred to the district immediately west of Hamilton in the counties of Wentworth, Wellington and Waterloo. I did not cover these counties by any means but did touch at Dundas, Galt, Breslau, Preston, Kitchener, Waterloo, Guelph, Alberfoyle.
